At the present time the Board are making grants on the assumption that they can safely indicate a sum of about £1,700,000, in addition to the indications made up to June 30, 1913. Out of the estimated figure of £1,700,000 the Board have already offered or allocated £113,120 to highway authorities in Greater London, and £269,485 to county borough councils in England and Wales in excess of the grants already made or arranged for. They expect to receive applications and to be able to arrange grants for the whole of the £1,700,000 in time to secure that highway authorities will be in a position to include the assisted works in the programme of work which will be covered either by supplemental estimates for the current year or by their annual estimates for the ensuing year.

The grants and loans made up to June 30 are apportioned as follow: Improvement of road crusts, £1,210,012; road widenings and improvement of curves, gradients, and corners, £120,466; road diversions, £29,395; reconstruction and improvement of bridges, £53,842; and new roads and bridges, £61,078; a total of £1,474,793.

The London County Council not having accepted the Board's scheme for the construction of a new road from Kensington to Hounslow, the Board had provisionally arranged for the Middlesex County Council to seek powers to construct a new road from Kew Bridge to Hounslow, the Board to contribute £400,000 towards the cost of the scheme, which will exceed £500,000. When the first-mentioned scheme fell through the Board proceeded to allocate advances totalling £280,000 to the Metropolitan Borough Council and other highway authorities, and £400,000 to provincial authorities for works of road construction and improvement. Having regard to the rapid extension of omnibus and heavy motor vehicle traffic in Greater London, the Board think that this allocation will serve the public interest as well as that originally suggested for a new approved road.

## DEVELOPMENT COMMISSION AND RURAL TRANSPORT.

The policy to be adopted in regard to the development of rural transport is now under the consideration of the Development Commission, although that body were appointed three years ago to carry out that and other objects. Data is being collected as to the results obtainable by road motor traction as compared with light railways as a means of affording the farmer the best means of transit of his produce and the importation of feeding stuffs when required upon his farm. The deliberations of the Commission are responsible for delaying the replies to requests received for grants from certain light railway undertakings in Yorkshire, which have been sanctioned by the Light Railways Commission, and have been favourably reported upon by experts appointed by the Board of Agriculture to consider the applications. Such reports had previously been made a qualification for grants from the Development Commission.

WHERE OMNIBUSES ARE WELCOMED.—On the grounds that motor omnibuses do no more damage to the roads than motor cars, and that they are not so dangerous to the public, Epping Urban Council have declined to support the Rural Council in petitioning all the highway authorities in Essex to oppose omnibus services to Epping, Chingford, and other places bordering on Epping Forest. Speakers at a meeting of the Urban Council also urged that the vehicles bring more trade to the town than they take out.

## MOTOR TRAFFIC NOTES.

TRAMWAY COMPANY TO RUN OMNIBUSES.—Motor omnibuses are to be run between Kidderminster and Bewdley by the local tramway company.

THE ANNUAL OUTING OF THE STAFF OF CHRISTOPHER DODSON, LIMITED, coachbuilders, Westminster, was held at Brighton, there being about 200 present.

GLASGOW CORPORATION AND OMNIBUSES.—The Tramways Committee propose to make application for further powers to run omnibuses in the city and in the adjoining districts.

LONDON GENERAL OMNIBUS CHARS-A-BANCS.—In addition to supplying motor omnibuses to private parties for outings, the London General Omnibus Company this summer have placed a number of chars-a-bancs in similar service.

TO THE MOORS BY OMNIBUS.—The motor 'bus service of the Sheffield Corporation takes folks to the moors, and it is now urged that a service should be run to Ringinglow, one of the most fascinating of the moorland districts within easy reach of town.

OMNIBUSES FOR CREWE.—The Town Council has decided to promote a bill to enable them to run motor omnibuses within the borough and to and from Crewe, Nantwich, Willaston, Haslington, and Sandbach. The town is now served only by horse omnibuses.

THE RIVALRY IN LONDON.—Motor omnibuses have started running from Edmonton, and in consequence local residents are urging the running of through tramcars to the City *via* Stamford Hill. As one correspondent says: "People use the 'buses because they save time and trouble of changing at Stamford Hill."

AN OPENING FOR OMNIBUSES IN WALES.—At a meeting of the Penybont Council recently, it was decided, on the recommendation of a conference of local Councils which had considered the question of railway facilities in the district, to invite motor omnibus companies to establish a motor service.

ENCOURAGEMENT FOR MOTOR OMNIBUSES.—In order to encourage the Gateshead and District Tramways Company to run a regular service of motor 'buses between Heworth and Hebburn, Hebburn District Council has instructed the surveyor to repair the high road between the two places as quickly as possible.

MIDDLESEX OMNIBUS TRAFFIC.—Mr. Wakelam, the county surveyor, writes in his annual report of the damage to roads since motor 'bus services have been inaugurated. The necessary extra expenditure for maintenance has caused the upkeep charges to increase to an alarming extent, and with the proposed extensions of omnibus traffic from the metropolis through Middlesex, further increased expenditure must undoubtedly be looked for.

TRAMWAYS V. OMNIBUSES AT OXFORD.—The latest plan for providing Oxford with a modern electric tramway service is arousing a good deal of opposition, and an agitation in favour of motor omnibuses instead of tramcars is proceeding. The position is, however, that the National Electric Construction Company have an agreement with the City Council, under which the former are to run electric tramcars, and without their consent it will be impossible to substitute omnibuses.

EDISON ACCUMULATORS, LIMITED.—This company was registered on August 5 with a capital of £150,000 in 135,000 7 per cent. participating preference shares of £1 each, and 300,000 ordinary shares of 1s. each. The first directors, to number not less than three and not more than eight, are Lord Montague of Beaulieu, 62, Pall Mall, S.W.; Colonel H. C. L. Holden, Gifford House, Blackheath; A. L. Pearce, Worcester House, Walbrook, E.C.; and J. F. Monnott, 49, Old Broad Street, E.C.

COVENTRY AND OMNIBUSES.—Councillor Pridmore, chairman of the Tramways Committee, has announced that they had under consideration the question of an extension to Earlsdon, but he thought that first they would have to try motor omnibuses, which they could do quickly, but, from the Corporation point of view, they must take into consideration the wear and tear on the roads. Having regard to the congested centre of the town, he thought they should get a small fleet of six omnibuses.

TRAMWAY AND OMNIBUS PASSENGERS IN LONDON.—Mr. Buxton (President of the Board of Trade), replying to Mr. W. Rea in the House of Commons on August 13, said that the number of passengers carried by tramway authorities working in Greater London during the year ended December 31, 1912, in the case of companies, and March 31, 1913, in the case of local authorities, amounted to 798,672,549, and the number carried during 1912 by omnibuses was upwards of 500,000,000. The corresponding figures for the first half of 1913 could not be given.

# MOTOR TRAFFIC.

DAIMLER OMNIBUSES AT BIRMINGHAM.—The accompanying illustrations show specimens of the 40-H.P. Daimler omnibuses recently put into service by Birmingham Corporation. Ten of these vehicles in all were ordered, and practically they are all now in service. They have attracted much attention by their silent running and fine appearance.

**Birmingham Daimler Omnibuses.**

BETTER ROADS FOR THE ISLE OF WIGHT.—To secure an improvement of the roads, the local Council are considering the question of taking up a large loan for strengthening the foundations of some of the main roads, with the assistance of grants from the Road Board. A system has just been adopted by which one man will be made entirely responsible for keeping in order a specified length of road, instead of having road foremen for districts larger than they can personally attend to. This involves the appointment of some 50 men in place of about half that number of road foremen.

EFFECT OF OMNIBUS COMPETITION WITH RAILWAYS.—Railway traffic returns for 1912, issued by the Board of Trade, indicate the manner in which motor omnibus services have been affecting railways. During the year the motor omnibus services were much improved and extended, especially in the metropolis and the adjacent districts. In some degree these services have created their own traffic by providing facilities for rapid locomotion in places where no such facilities previously existed, but their effect in reducing short-distance railway travelling must nevertheless have been considerable.

THE TRAFFIC PROBLEM IN URUGUAY.—Mail advices show that in Monte Video, where some two years ago the Uruguayan Government established a service of small motor 'buses, the service has been abandoned. The reason given is the cost of upkeep due to the bad condition of the highways. The Government have stated that as soon as the roads have been asphalted this service will be resumed. Discussing the probability of omnibus competition with tramways in the Argentine, *The Review of the River Plate* observes that the roads in Monte Video are better than those in Buenos Ayres.

A MAUDSLAY CATALOGUE.—The Maudslay Motor Company, Limited, have issued a handsome catalogue on industrial and public service vehicles. The catalogue contains a brief description of a Maudslay engine with drawings and numerous photographic illustrations of various parts, together with price list of the chassis and specifications of the respective types. Numerous types of lorries, vans, chars-a-bancs, and omnibuses are set out. Users of commercial vehicles will find running costs which are given for machines of various capacities, of much interest. A full list of spare parts concludes a publication of more than usual interest.

OMNIBUSES AS TRAMWAY FEEDERS.—A discussion raised by Councillor Morris, at the Doncaster Council meeting, on a motion that the Council should consider the advisability of purchasing six or eight motor 'buses, as an experiment, to run between Doncaster and Brodsworth and Adwick-le-Street and Balby to Edlington, has excited considerable interest in the borough. Interviewed on the subject, Mr. Rayner, the manager of the Corporation tramways, says he believes in the adoption of 'buses as "feeders" to the cars, but not as a substitute for them. The cost of a motor 'bus and a tramcar, said Mr. Rayner, was identically the same, about £850, but whereas an expenditure of 9d. per mile was involved in running an omnibus, a tramcar only cost 6d. per mile to run. This, of course, does not include the cost of laying a track, but Mr. Rayner thinks sinking fund and interest on this could be met by an extra 2½d per mile.

MAUDSLAY CHARS-A-BANCS IN SERVICE.—The accompanying photographs illustrate one of two chars-a-bancs which the Maudslay Motor Company have supplied to the Oldham Equitable Co-operative Society. This societ arranges long excursions from Oldham down to the

**Maudslay Chars-a-Bancs.**

Midlands, South of England, and Central and North Wales, the trips usually covering about four or five days. The first illustration shows the vehicle collecting its passengers in the centre of Coventry, previous to a trip to Cheltenham, and the second illustration shows it passing along the Warwick Road on the outward journey.

TRADERS AGAINST TRAMWAYS.—Interviewed with reference to the desire of the London County Council to construct a tramway from the Marble Arch to Cricklewood, Mr. A. Garrould, a member of the Marylebone Council, says that more than 80 per cent. of the shopkeepers in Edgware Road were opposed to the scheme. "A few years ago," he said, "I gave evidence before the Select Committee of the House of Commons in favour of this extension, but in those days we were being badly served by the omnibuses. Things are altered now, and we are so well served that practically everybody in the road is opposed to the introduction of the tramways."

## WEEKLY LIST OF TENDERS INVITED.

### ILKLEY URBAN DISTRICT COUNCIL.

ELECTRICITY SUPPLY.

(In the Ilkley Urban District and Township of Middelton).

The Council are prepared to receive tenders for Electric Generating and Distribution Plant as follows:—

Section 1.—Prime Movers.
Section 2.—Station Equipment.
Section 3.—Cables and Distribution.
Section 4.—Overhead Travelling Crane.

Copies of the specifications and general conditions can be obtained from the undersigned or from the Consulting Engineer, Mr. George Wilkinson, Beech Mount, Harrogate, on payment of a fee of two guineas in respect of each section applied for. The deposit will be refunded on the return of the specifications, accompanied by a *bonâ-fide* tender.

Tenders, sealed and endorsed "Tender for Electricity Works," must be sent to me at the Town Hall, Ilkley, not later than Tuesday, the 7th day of October, 1913.

The Council do not bind themselves to accept the lowest or any tender, and reserve to themselves the right of accepting the whole or part of a tender.

By order, F. S. ECKERSLEY,
Clerk of the Council.

Town Hall, Ilkley,
September 5, 1913.

### ELECTRIFICATION OF MELBOURNE SUBURBAN RAILWAYS.

The Agent-General for Victoria is prepared to receive tenders for:—

Overhead Electrical Equipment of Permanent Way and Overhead Transmission Mains

in connection with the electrification of the Melbourne Suburban Railways now being carried out.

Specification and form of tender may be obtained from the Agent-General for Victoria on or after Monday, September 15, 1913. Any tenderer requiring information in addition to that contained in the specification may apply to the Consulting Engineers, Messrs. Merz and McLellan, 32, Victoria Street, Westminster, S.W.

The charge for the specification is £5 5s. for the first copy, and £2 2s. each for any further copies. Sums paid for copies will be refunded on receipt of a *bonâ-fide* tender for the whole of the works included in the specification.

Sealed tenders, marked "Electrification of Melbourne Suburban Railways—Tenders for Electrical Equipment of Permanent Way and Overhead Transmission Mains," are to be addressed to the Agent-General for Victoria, and delivered at his office, Melbourne Place, Strand, W.C., not later than 12 noon on November 15, 1913.

The Government do not bind themselves to accept the lowest or any tender, and ample security will be required from the contractor whose tender is accepted.

### LIVERPOOL CORPORATION TRAMWAYS.

CONTRACT FOR THE SUPPLY OF TICKETS.

The Tramways and Electric Power and Lighting Committee are prepared to receive tenders for three years' supply from the 1st January, 1914, of Passengers', etc., Tickets. The approximate quantity used per annum will be 150,000,000.

Copies of specification, general conditions, and form of tender may be obtained on written application to the General Manager, Corporation Tramways, 24, Hatton Garden, Liverpool, where standard samples of the tickets may be viewed any day (except Saturday and Sunday) between the hours of 9 a.m. and 5 p.m.

The Corporation do not bind themselves to accept the lowest or any tender.

Tenders must be posted in the official envelope provided, duly sealed, addressed to the "Town Clerk, Municipal Buildings, Liverpool," and endorsed "Tender for Tickets," so as to be received not later than 10 a.m. on Thursday, September 25, 1913.

EDWARD R. PICKMERE,
Town Clerk.

### MATLOCK URBAN DISTRICT COUNCIL.

TRAMWAY CABLE.

The above Council are prepared to receive tenders for about 1,967 Lineal Yards of Patent Steel Wire Tramway Cable, with Manilla Core (3¼in. in circumference), delivered at their Depôt, Matlock, carriage paid.

Particulars, specifications, and terms as to payment may be obtained from Mr. C. P. Foster, Tramway Manager.

Tenders, accompanied by samples of wires, to be delivered at my office (marked "Cable") not later than 12 noon, Saturday, September 20, 1913.

The Council do not bind themselves to accept the lowest or any tender.

R. TAYLOR,
Clerk to the Council.

Town Hall, Matlock,
September 3, 1913.

### LONDON—INDIA OFFICE.

The Secretary of State for India in Council is prepared to receive tenders from such persons as may be willing to supply:—

(1) Rails.
(2) Fishplates.
(3) Bearing-Plates.
(4) Coachscrews and Dogspikes.

The conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W., and tenders are to be delivered at that Office by 2 o'clock p.m. on Friday, September 19, 1913, after which time no tender will be received.

H. J. W. FRY,
Director-General of Stores.

India Office, Whitehall,
September 10, 1913.

### BOROUGH OF HAMMERSMITH.

The Borough Council invites tenders for the supply of 1-125 h.p. Alternating Current Motor. Full particulars, specification, and form of tender may be obtained from Mr. G. G. Bell, Borough Electrical Engineer, 85, Fulham Palace Road, Hammersmith, W. Sealed tenders, endorsed "Tender for Motor," must be delivered to me at the Town Hall, Hammersmith, not later than 4 p.m. on Wednesday, September 24, 1913.

The Council does not bind itself to accept the lowest or any tender.

LESLIE GORDON,
Town Clerk.

Town Hall, Hammersmith, W.,
September 9, 1913.

## BOROUGH OF WORTHING.

EXTENSION OF PLANT—ELECTRICITY WORKS.

The Corporation invite tenders for the supply, delivery, and erection complete at the Electricity Works, Worthing, of One Generating Set, consisting of a Diesel Oil Engine and a Direct Coupled Direct Current Generator.

Forms of tender, specification, plans, and general conditions may be obtained from the undersigned on payment of a deposit of £2 2s., which will be returned on receipt of a *bonâ-fide* tender, and in the case of the successful tenderer on the execution of the contract.

Sealed tenders, endorsed "Generating Plant," must be delivered at my Office not later than 12 noon on Monday, the 29th day of September, 1913.

The Corporation do not bind themselves to accept the lowest or any tender.

J. KENNEDY ALLERTON,
Town Clerk.

Municipal Offices, Worthing,
September 8, 1913.

## POSITIONS VACANT.

### TORQUAY TRAMWAYS COMPANY, LTD.

PLATELAYER.

Applications are invited for the above position. Candidates must have experience in maintenance work, and must be able to, or willing to learn to, drive a car when required.

Applications, stating experience and wages required, together with copies of testimonials, to be forwarded to the undersigned.

H. HOLLIDAY,
Engineer and Manager.

Car Sheds, Torquay.

### MAIDSTONE CORPORATION TRAMWAYS.

INSPECTOR.

The above Corporation invite applications for the position of Inspector at a commencing salary of 33s. per week, rising to 35s. at end of first year, if satisfactory. Apply, stating age, qualifications, and present occupation, accompanied by copies of not more than three recent testimonials to be sent on or before September 22, to the

GENERAL MANAGER,
Tram Depôt,
Tonbridge Road,
Maidstone.

### DEPOT CLERK.

Wanted immediately; Shorthand and Typing essential. Send detailed particulars of previous experience, copies of testimonials, age, wage asked, and when could commence duties, to Manager, Tramways, Colchester.

## BONUS SCHEME REDUCES ACCIDENTS.

The Socialistic perversion of the trade union idea has come near to placing the Manchester car hands in a ridiculous position. One of the desires of the street corner orators who have set out to capture the trade unions is to reduce all workers to a dead level of exertion and wages. The evils that would overtake British commerce if these folk had their way are too evident to need enumeration, and it follows that if tramway employees came within the same influence the incentive to efficient discharge of duty would vanish. The result then would be that the complaints of the travelling public, which are now too numerous in some places, would become overwhelming. Fortunately for the Manchester men, they have been rescued from a foolish position by the keener perception of their national executive's secretary, who, as an alderman of Salford, has obtained a more business-like impression of men and things than is shown by the majority of union organisers. The Manchester tramwaymen have for some time raised opposition to a bonus system which is in operation on that undertaking, but on the advice of Alderman Jackson, who urged that "it would be very foolish to refuse what is really an advance in wages," they have come to the sensible resolve to withdraw from their untenable position. Manchester is not the only place where similar opposition has been shown to laudable efforts in the form of bonus schemes to induce car workers to put forward their best endeavours. An argument commonly used is that a bonus based on, among others things, current consumption, leads to motormen taking risks in the control of their cars. It is further contended that dissension is engendered between a motorman and a conductor. The experience of the Manchester tramway department, however, does not bear out such contentions. Moreover, it goes to show that these forebodings art not only falsified, but that accident claims are reduced in a remarkable manner. Under the bonus scheme 13s. is allowed to drivers who for thirteen consecutive weeks have been free from blameable accidents and whose current consumption records have been satisfactory. This plan has been in operation since February 2, 1911, and for the last year 93 per cent. of the drivers earned the bonus. A bonus of 1s. to conductors, and 6d. to trolley boys for each complete week worked is allowed quarterly to all who are free from blameable accidents and whose records during that period are satisfactory. This scheme has only been in operation since May 1 last. The first quarter's bonus has just been paid, and 94 per cent. of the conductors and 82 per cent. of the boys received bonuses. In an interview which he gave before setting out to report on street traffic conditions in the most important centres on the Continent, Mr. McElroy, the general manager, stated that the bonus for motormen has worked very well, and in no instance has it been stopped because of current consumption, this being merely of secondary importance. A remarkable result of the first year's working of the scheme is that the amount paid out in accident claims went down by just the amount that was paid out to the drivers in bonus. In other words, the money that formerly went into the pockets of the public now goes to the drivers. At the end of the second year's working Mr. McElroy hopes to see even better results. Nearly all the men, he says, earned the bonus; it really acts as a valuable incentive to do good work, and the system has recently been put into operation for the conductors. The wisdom of well-considered plans for obtaining the maximum efficiency on the part of employees has also been shown during the past few years at Bradford, where Mr. C. J. Spencer has made increase of wages payable only when a man has given efficient service. The firmness of the management in this respect, combined with readiness to consider any representations put forward by the men for improved conditions, were the factors that led the employees' union to pass, as recorded in our issue of September 6, a resolution tendering to the Tramway Committee and the manager their thanks for generous treatment and unfailing courtesy and consideration. Tramwaymen generally would do well if they took to heart the Bradford men's expression of hope that the conditions of employment now prevailing may result in a higher standard of service.

## SHEFFIELD EMPLOYEES IN A QUANDARY.

Citizens of the British steel capital are held in high repute as being men of discernment, high business capacity, and honour, but unless some friend comes to the rescue of the union employees among the tramwaymen there is a danger that those qualities will be tarnished as far as the working classes are concerned. The difficulty facing the men is their inability to understand that arbitration proceedings on questions relating to conditions of employment—to be satisfactory to all concerned—must embrace reasonably wide terms of reference. Continuing the generous treatment represented by advances totalling £15,000 in nine years, the Tramways Committee recently decided to grant time and a-half payment for Sunday labour to motormen and conductors of five years' service. Because the Committee refused to extend this concession to all employees there were threats of a strike. An offer by the Committee to submit the question to arbitration recalled the agitators to their senses, and it is worthy of

Digitized by Google

note that before reason was again enthroned the newspapers had shown, through their editorial and correspondence columns, that public opinion was entirely against the men. On the appointment of arbitrator the two parties were agreed to select his honour Judge Benson, but when it came to settling the terms of reference there was a disagreement as to the extent of the question to be submitted. The Deputy-Town Clerk drew up draft terms which asked his Honour to decide on the men's original application for an increase of pay (which the Corporation have in part granted), having regard (1) to the present terms and conditions of service and pay and emoluments of the employees, as compared with the terms and conditions of service and pay and emoluments obtained in other tramway undertakings; (2) to the improvements in the terms and conditions of service and pay and emoluments of the employees which had been made from time to time in the past; and (3) to such other facts and arguments as might be submitted by either party in support of or against the application. These terms, we believe, are identical with those accepted by the Manchester Tramways Committee and their employees for the arbitration proceedings in that city a year or two ago. The possibilities that would be afforded by the third heading ought to satisfy intelligent persons, but not so the Sheffield men. They revealed the weakness of their case by declaring that the point at issue is one of Sunday pay only, and that the arbitration should be limited to the question "whether time and a-half for all employees for Sunday labour who are receiving less than that rate shall be granted to all employees other than motormen and conductors with five years' service." They object to heads (1) and (2) of the terms of reference, and although Alderman Jackson, the general secretary of the Union, agreed that the Corporation should give evidence under those heads, the local officials of the Union are not prepared to admit such evidence. Further, the employees so far forgot what is due from a party to an arbitration as to ask the Committee to re-open negotiations and to receive a deputation to discuss the advisability of further extending the concession of time and a-half for Sunday labour. The Committee decided that having agreed to refer the matter to arbitration they were unable to adopt the suggestion. When the Committee's report came before the Corporation on Wednesday, their action was confirmed without discussion, after the reading of a letter from Sir William Clegg, the chairman, urging the Council to support the Committee's adherence to the terms of reference. Any alteration, he declared, would be unfair not only to the Committee, but to the ratepayers. The objections raised by the Union officials afford corroboration of the report recently presented by the general manager, showing that the Sheffield motormen and conductors are the best paid in the United Kingdom.

## BRISTOL TRAMWAYS PURCHASE QUESTION.

The Bristol Corporation will shortly be called upon to decide whether they will purchase the Tramways and Carriage Company's undertaking. A report on the subject, signed by Mr. George Pearson, the chairman of the Special Committee appointed to investigate the matter, stated that after having obtained all the information possible with reference to other undertakings, and with a view of arriving at an approximate valuation of the Bristol undertaking, it was felt that expert advice should be obtained. Accordingly the assistance was obtained of Mr. J. B. Hamilton, general manager, Leeds Corporation tramways, and of Mr. J. F. C. Snell, consulting engineer, of the firm of Messrs. Preece, Cardew, and Snell, both of whom have had a very extensive experience of tramways in this country, and also in the valuation and purchase of undertakings under the Tramways Act, 1870. These gentlemen were instructed to endeavour to estimate the cost of acquiring the undertaking, and to state the probable income to the Corporation if the latter should determine to acquire and work the tramways, having regard to the risk which might possibly arise of tramways becoming an unpopular or obsolete form of traction, and having regard also to the cost of running other competing forms of traffic; whilst they were further invited to give an opinion as to whether it would be advisable for the present to leave the tramways in the present company's hands under the terms of the Tramways Act, 1870, or whether they would recommend the Corporation to purchase the undertaking and (1) either work it themselves or (2) leave it to the existing or any other company. Finally, they were asked to advise as to whether it would be advantageous or otherwise to the Corporation for them to enter into an agreement to refrain from exercising their option of purchase for any given period in consideration of either a capital sum or an annual rental.

Messrs. Hamilton and Snell have advised that in their estimate the Corporation possess a very valuable option, which it would be advantageous for them to exercise on May 1, 1915, in the absence of any important or radical changes. The committee feel that it is not advisable to publish the report of the experts, but think that the Council should at the present time put themselves in a position to work or otherwise operate the undertaking to the best possible advantage of the city, in case the Council decide to acquire it at the time when the option to purchase can be exercised.

The Corporation can acquire the greater portion of the tramways in 1915, and the committee recommends that the Corporation should apply for powers to work the tramway undertaking if acquired, and also to raise the purchase money. When such powers are obtained the Corporation will be in a much stronger position to negotiate with the existing or any other company for the carrying on of the undertaking than they would otherwise be, or they would be able to work the undertaking themselves. Before the Council is called upon to determine whether they will purchase the undertaking in 1915, they will be supplied with a full report. At the meeting of the Town Council on September 9 the report was adopted.

## NEW AND PROSPECTIVE WORK.

ABERDEEN.—The Tramways Committee are considering a scheme for the erection of a new car shed, the total cost amounting to over £6,000. It is also proposed to extend the points out to Cranford Road so that cars can pass into the present shed through the new shed, and on to Cranford Road in order to avoid backing the cars out and in.

DARTFORD.—Balfour, Beatty and Co., Limited, have informed the Urban Council that as their lease of the Dartford Light Railways expires in less than eight years, they will not be able to finance the construction of the connecting line between Horns Cross and the termination of the Gravesend tramways at Swanscome, unless such line is to be taken over by the Council at the same time as the lease of the light railways falls in, and asking if the Council will agree to take over the connecting line.

DEWSBURY.—The Town Council have entered into an agreement with the National Electric Construction Company for the construction and leasing of tramways to Shaw Cross and Dewsbury Moor.

DUNDEE.—The Tramways Committee recommend an extension of the Blackness line to Glamis Road at a cost of £500.

HUDDERSFIELD.—The tramways will be extended to West Vale before the end of the year, thus giving a through connection with Halifax.

KEIGHLEY.—The period for the commencement and for the completion and opening for traffic of three tramways already authorised has been extended.

LEITH.—The Town Council have decided to seek legislative sanction to an extension of the tramways from the Seafield terminus to the boundary on Portobello Road. It is hoped that arrangements will be made with the Edinburgh Council to carry the extension right on to Portobello.

LLANDUDNO.—The Llandudno and Colwyn Bay Electric Railway, whose present Colwyn Bay terminus is in the centre of the town, have decided to continue their lines in a westward direction through the village of Old Colwyn for a distance of nearly two miles.

MUMBLES RAILWAY ELECTRIFICATION.—Mr. Tegetmeier, chairman of Swansea Tramways Company, and Mr. Little, the company's consulting engineer, paid a visit to Swansea on September 9 for the purpose of considering a scheme for the electrification of the Mumbles Railway, which is about five miles in length. The project would involve an expenditure of about £50,000. At present the trains occasionally carry 30,000 passengers a day.

SOUTHEND.—The Council proposes to spend £16,000 on laying double lines in Southchurch Road and Southchurch Beach Road.

SOUTH SHIELDS.—Harton Parish Council have stated that they approve of the proposed extension of the tramways to Harton village, and they suggest a further extension with a view to linking up with the Sunderland system.

WEMYSS.—The Wemyss District Tramways Company intend to double the line from Leven to Yallatown with as little delay as possible.

YORK.—The Council have referred back to the Tramways Committee for further consideration proposals to make three extensions under the Light Railways Act, including one along Hull Road at an estimated cost of £20,220. The committee had themselves deferred consideration of a proposed extension *vid* Leemar Road, estimated to cost £8,710, in order for the Streets Committee to take up the question of providing better access to the district.

## WHEN REVENUE REACHES 1s. PER CAR MILE.

At the September meeting of the Burnley Town Council, Alderman Sharp Thornber drew attention to the monthly return of tramway traffic, and said it seemed they were earning less per car mile than last year. Councillor Heap, the chairman of the Tramways Committee, admitted that this was so, and Councillor Race stated that for the month of July the tramways earned 11.85d. per car mile, as against 13.10d. in the same month last year, adding that they had overdone the extra service of cars altogether. Councillor Irving: Has it not been argued by those who know that a very high receipt per car mile is not an advisable thing, and that beyond a certain figure the proper method of tramway work is to reduce the receipts per car mile? Councillor Heap admitted that the figures quoted by Councillor Race were quite correct, but still the Council would notice that the receipts for July were £1,000 more than in July of last year. Councillor Race: How much more are the expenses? Councillor Heap: Not near so much as the receipts. I think we show up very well in the returns. I am quite satisfied, along with the manager, that when we find traffic on the road it is a mistake not to try to pick it up. We do this, and I contend we have been fairly successful. The rule amongst tramway managers, when they get to a revenue of a shilling per car mile, is to put more cars on the track. The receipts are £1,000 up for July, even if they are less per car mile. We have carried 1,451,313 passengers, as against 1,277,764 in July of last year, and I think that is very satisfactory.

## MISCELLANEOUS NEWS AND NOTES.

**P.A.Y.E. Cars at Aberdeen.**—The P.A.Y.E. cars at Aberdeen have been running for 18 weeks on one of the routes, and show an increase in takings of £427.

**A Sheffield Anniversary.**—September 6 was the fourteenth anniversary of the inauguration of electric tramcars at Sheffield. The Corporation retains the first ticket issued.

**Omnibuses to be Ordered for Warrington.**—The Corporation tramways manager has been directed to advertise for the supply of two additional motor omnibuses similar in construction to those already in use.

**Tramway Burdens.**—An article in the *Morning Post* on the financial position of the L.C.C. tramways suggests an impartial inquiry into the subject of charging the undertaking with the cost of street improvements.

**Tramways for Ecuador.**—The concession just obtained by Lord Murray on behalf of Messrs. S. Pearson and Sons, Limited, includes schemes for tramways in Ecuador. The concession will run for a period of 40 years.

**Municipal Electrical Association.**—The Incorporated Municipal Electrical Association have published their proceedings for the year in a five shilling volume. All the valuable papers and reports read at the June convention at Kingston-on-Thames are included.

**Breakdown in Liverpool.**—At 4.30 on Sunday afternoon there was a breakdown at the Liverpool generating station of half an hour, and the whole of the tramway service was stopped. The trouble at the generating station also affected all places which used electric light.

**New Cars for Wigan.**—The Tramways Committee, desirous of purchasing new cars, are considering the design likely to be most suitable. A visit has been paid to Bolton to see a car which, with slight alteration and modification, might with advantage be adopted on the Wigan tramways.

**The Radius of a Curve at Montreal.**—A difficulty has arisen between the local tramway company and the municipality regarding the proposed curve of 600ft. around the site of the Cartier Monument in Park Avenue. The company insist that the curve will be dangerous and should be at least 1,200ft.

**Contract Tickets.**—The Southport Tramways Company have ceased to issue contract tickets on their system, thus following the example set last January on the Corporation tramways. The Tramways Committee have since found the takings in daily fares to be larger than the amounts paid for contracts.

**Concession to Manchester Tramwaymen.**—At the meeting of the Manchester Tramways Committee on September 9 it was decided to recommend the City Council to grant increases of 1s. per week to motormen, conductors, and trolley boys. It was stated that these increases would mean an additional expenditure of £6,000 per year.

**Skating to Save Time in a Store-Room.**—In the store-rooms of the new car depôt of the Union Street Railway Company, New Bedford, Mass., roller skates are worn by the stock-room attendants in traversing the extended floor area. The skates do not interfere with work on the ladders, and in taking inventories of stock they prove of great utility.

**New Pattern Seats at Doncaster and Sheffield.**—The saloon of a new car at Doncaster contains a new type of seat, the invention of Mr. E. S. Rayner, the tramways manager. It rests on legs and can be tipped back, thus facilitating the cleaning of the floor. The space underneath gives room for parcels. Mr. Fearnley, of Sheffield tramways, has adopted the seat for future use.

**The Rating of Tramways.**—In the judgment of the House of Lords on the Metropolitan tramway rating case, Lord Moulton accused the promoters of tramways of making improper use of the Light Railways Act, which was not intended to apply to them. In the discussion on the Bill Mr. Ritchie, then President of the Board of Trade, stated that its provisions were intended to apply to tramway undertakings.

**Vestibule Cars for Glasgow.**—At the Corporation tramway works new cars are being made at the rate of about ten each week in an order for one hundred vehicles. The department are also busily engaged placing vestibules on the whole stock. Already three hundred have been thus dealt with. There are now only some fifty of the old converted horse-drawn cars in the service, and they are used only at times of pressure.

**Route Indicators Required for Montreal Cars.**—A London visitor has advised the Montreal Tramways Company to give more information on the tramcars as to the routes being traversed. The value of more information signs would be in the direction of acquainting people of the various traffic points on the journey. Reversible signs, too, would prevent confusion as to the direction in which a car would be going.

**Steel Paving Blocks.**—In connection with track maintenance, the annual report on the Oldham tramways mentions that a number of steel paving blocks have been laid in Union Street for experimental purposes. The net working expenses of the Oldham undertaking per car mile were 6.084d. as compared with 4.528d. five years ago. Maintenance and equipment were more costly than a few years ago, being 2.11d. per car mile.

**The Dublin Strike Fiasco.**—The tramway service in Dublin is being well maintained in spite of the partial strike. Last week, however, the receipts were down by £3,405 as compared with the corresponding week of last year. To mark their sense of the action of the strikers many employers in Dublin have locked out those of their employees who are members of the Transport Workers' Union. Larkin, the strike leader, has again been remanded on the charge of sedition.

**Manchester's All-Night Cars.**—Although the Tramways Committee are not yet in a position to give a definite statement as to the newly-inaugurated all-night car service, disappointment is being expressed. About 2,500 people signed the petition in favour of the cars, but in the first fortnight of the experiment not more than a third have patronised them. The department will keep records of the returns for three months, when it will be possible to report definitely as to profit and loss.

**Curious Tramway Boycott.**—A consular report on Hong Kong describes a tramway boycott resulting from the decision of the company owning the Low Level Tramway to accept nothing but the legal tender in payment of fares. The boycott is said to have been due partly to interested action on the part of small bankers, money-changers and others who make large profits by the manipulation of exchange between Hong Kong currency and Chinese silver coins, and partly to political agitators.

**Peckham Trucks at Doncaster.**—During the first week in September the tramways department introduced in traffic a car of unusual length for Doncaster. It seats 74 passengers, the body being mounted on a Peckham radial truck, which passes round curves with greater ease than an ordinary single truck car, while the latter seats only 52 persons. Six other cars for which an order has been placed will have the Peckham pendulum truck. The makers of the trucks are the Brush Company, while the bodies are the work of the United Electric Car Company.

**The New Route at Birmingham.**—The Hagley Road route on the Birmingham tramways has been meeting with much support since its opening. With the arrival of the cars the omnibuses disappeared from Hagley Road, this being in accordance with the terms of the Watch Committee when the 'buses were licensed. The contract for the construction of the new line was secured by Mr. George Low, of Kidderminster, under the superintendence of the City Surveyor, who took advantage of the occasion to reconstruct the remainder of the paving of the carriage way for almost the entire length of the route. The length of the tramway is 2 miles 308 yards.

**Manchester Tramways and Football Traffic.**—Complaints are being made that the tramways department are not sufficiently enterprising on the occasion of football matches at Old Trafford. The officials declare that there is no justification for the complaints, and that so far as tramway service is concerned the Manchester United are treated better than any other football club in the country. Every Saturday 180 cars are requisitioned to take people to the United ground. The Corporation, however, are negotiating with Stretford Council for the laying of a tramway line along Talbot Road and Warwick Road. This would remove some of the congestion.

**First-Class Cars.**—Liverpool Council have agreed to run first-class cars on new routes. Though some members said these first-class cars did not pay, Alderman Smith, the chairman of the committee, insisted that first-class cars earned more money than the other cars.—Some luxurious first-class cars are to be put on the new Hagley route on the Birmingham tramways. The intention of the Birmingham Corporation to have two scales of fares is causing some criticism. There will be no cars exclusively first-class, but on the special cars a first-class ticket will admit to the inside of the car while the other passengers will have to ride on the top as in Liverpool.

**Heywood to Purchase Current in Bulk.**—At the August meeting of the Town Council it was arranged to purchase electricity in bulk from the Bury Corporation. It was urged that the committee should take into consideration the question of handing over the whole of the tramways to the Bury Corporation. Mr. J. Ashworth, chairman of the Electricity and Tramways Committee, reported that his committee had very carefully considered the question of taking electricity in bulk, and they had decided to accept the offer of Bury for a supply for ten years, with the option of a further five years. The result of this, in the opinion of the engineer, would be a saving of at least £1,388 per year.

Digitized by Google

The taking of this bulk supply from Bury would necessitate an expenditure of about £12,000. The interest and sinking fund on this sum would be £750 a year, and even when this £750 had been paid the saving would be £1,388 per annum.

**Automatic Route Indicators.**—There are being introduced to the Stock Exchange the shares of a small company called the Route Recording Advertiser, Limited. The company are dealing in an automatic device for use in tramway cars and omnibuses to indicate the route. A street plan indicating all turnings and points of interest along the route moves automatically in accordance with the progress of the vehicle, about half a mile of the route being visible at a time. The company has a capital of £12,000 in five shilling shares, and the directors include Mr. Edward R. Soames, who is a director of the London Suburban Traction Company, which controls the Metropolitan Electric and London United Tramways and the M.E.T. Omnibuses.

**Hours of Labour and the Sickness Rate at Newcastle.**—Four hundred tramwaymen are stated to have now joined the union, and the branch president declares that they will soon be in a position to say that the man who did not join the Association would not be allowed to work on the Newcastle tramways system. He omitted to mention, however, that the Corporation will have something to say in reference to such a campaign of coercion. A deputation recently waited upon the Tramways Committee to demand lower hours and higher wages. It was pointed out that during the last year one-sixth of the men had been off over four weeks through sickness. The only preventive of that sickness was an eight-hour day. The Tramways Committee, according to the union secretary, have agreed that inspectors and timekeepers be chosen according to seniority and ability to do the work required of them.

## CONTRACTS AND ORDERS.

**Crompton and Co.** have obtained a contract from Doncaster Council for the supply of feeder panels.

**British Westinghouse Company** have received an order for 24 gear wheels for tramcars, at £2 13s. 0d. each, from Yarmouth Council.

**Wigan Council** have given the contract for painting the tramway standards to Messrs. Dawber and Cheetham.

**Stalybridge Joint Tramways and Electricity Board** have ordered a second motor wagon from Foden's, Limited, at £521

**British Insulated and Helsby Cables** have received from the Victorian Railways Department a contract for the supply of rail bonds.

**Dundee Council** have given contracts to Bruce, Peebles and Co., Limited, for converting machinery, at £1,500; and to the British Insulated and Helsby Cables, Limited, for cables.

**Hobart Council** are buying a six months' supply of tramway tickets in England. The estimated cost is £123, and it is declared that it would cost four times as much to have the tickets printed locally.

**Melbourne Municipality** have accepted the following tenders:—Spare armature for 500 kw. motor generator, British General Electric Company, £200; insulated copper cables, British Insulated and Helsby Cables, Limited, £1,361.

**Sheffield Council** have allotted contracts to Stuart and Moore for the installation of 50 patent telephonic street alarms, £4,007; Blasberg Engineering Company, supply and erection of two natural draught cooling towers, £8,770; Royce, Limited, supply and erection of three electric capstans, together with three fairleads, wire ropes, motors, etc., £1,128.

**Manchester Council** have awarded the following contracts:—Water-softening plant at Stuart Street station, Kennicott Water Softener Company, Limited; construction of new meter repair workshop at the Polygon Stores, Messrs. J. Gerrard and Sons, Limited; cables, W. T. Henley's Telegraph Works Company, Limited, Callender's Cable and Construction Company, Limited, and Messrs. Johnson and Phillips.

**Warrington Council** have accepted the following tenders:—Premier Accumulator Company, battery, booster, and switchboard plant for the tramways department; British Thomson-Houston Company, Limited, feeder panel, £84; Albion Clay Company, Limited, annual supply of conduits; Underfeed Stoker Company, Limited, patent underfeed stoker, with forced-draught fan and motor, £258; Veritys, Limited, motor generator, £52 10s.

**Glasgow Tramways Committee** have accepted the following tenders:—Sheet mica, Micanite and Insulators Company, Limited; armature binding wire, W. N. Brunton and Sons; scrap, zinc, lead-covered cable, brass turnings and borings, brass dust, copper and mica turnings, dry cells, J. Jackson and Co.; scrap lead, brass, copper, motor field coils, armature coils, P. and W. MacLellan, Limited; scrap vulcanised rubber cable, Ballardie, Holden and Co.; scrap rubber and motor tires, City Waste India-Rubber Company, scrap old bagging, George Cunningham; altering superheaters for Pinkston power station, Babcock and Wilcox, Limited.

**Petrol-Electric Tramcars for Hastings.**—W. A. Stevens, Limited, 26, Victoria Street, London, have received an order from the Hastings and District Tramways Company to fit several of their cars for petrol-electric propulsion as an experiment, with a view to establishing through running from Hastings to Bexhill. If the vehicles are found to run satisfactorily twenty such cars will be required. Readers will remember that the use of the surface contact system on two miles of the Hastings sea front has been forbidden by the Board of Trade, whose licence expired on September 6. In order to enable the test of the petrol-electric cars to be satisfactorily carried out, the company have applied to the Board for an extension of the licence, and this application has been supported by the Town Council. Three petrol-electric cars by Messrs. Stevens are now running on the East London lines of the London County Council.

## PERSONAL.

**Mr. C. H. Chester,** traffic superintendent of the Salford Corporation tramways, has obtained an appointment in New Zealand.

**Mr. C. C. Hutchinson,** barrister, has delivered his award to the Bacup Town Council regarding the differences between Bacup and Rawtenstall over the tramways lease.

**Mr. H. Parkes,** depôt superintendent, Burton tramways, has been recommended by the Tramways Committee for an increase of £5 on his salary of £140 per annum.

**Messrs. Merz and McLellan,** of London, are acting as consulting engineers to Perth Council (Western Australia) in connection with the scheme for erecting a new power house.

**Mr. S. Boys,** supplies manager to the Sheffield branch of Siemens Bros.' Dynamo Works, has been appointed to take charge of the London business of the Edison and Swan Electric Light Company.

**Mr. N. P. Perez,** who has for several years been connected with the Electric Construction Company, Wolverhampton, has resigned on appointment as chief engineer and designer to Crompton and Co., Chelmsford.

**Messrs. Wilson and Winstone,** of the New Zealand Portland Cement Company, Whangarie, are journeying to America and Europe for the purpose of purchasing machinery for the generation of hydro-electric power at Waitoa Falls.

**Mr. H. G. Matthews,** who is referred to by a local journal as the popular manager of the Quebec Railway, Light, and Power Company, has reported that the company are making record profits, and that this year will prove to be the most successful on record.

**Mr. Stanley Dudman,** late manager of the Dartford tramways for Balfour, Beatty and Co., Limited, has been appointed to take charge of the firm's new tramways between Ripley and Nottingham. Mr. D. N. R. Bruce, late of Stroud (Glos.), has become manager at Dartford.

**Mr. A. J. Pembery,** of the india-rubber department of Siemens Bros., Limited, Woolwich, on the completion of fifty years' service, has been presented by the firm with a purse of gold, and by the staff and employees with a gold watch and chain, and a gold-mounted umbrella for Mrs. Pembery.

**Mr. C. Lucken,** who for five years has been engineer-in-charge to Siemens Bros. and Co., Limited (Tantalum Lamp Works), Dalston, has accepted a similar appointment with the Hong Kong and Shanghai Banking Corporation, Gracechurch Street. Mr. Lucken was presented with a marble clock by his late colleagues.

**Mr. E. P. Grove** will arrive at Melbourne about the middle of September to supervise the works in connection with the electrification of the suburban railways on behalf of Mr. C. H. Merz Mr. Stone, the electrical engineer to the Victorian Railways Department, will not take charge until the electrification has been completed.

**Mr. E. Sockington,** who was the recipient of a silver cigarette case from the passengers taking part in the first of the six-day road motor tours arranged by the Bath Electric Tramways Company, Limited, is the traffic superintendent of that company, and not of the local branch of the Bristol Tramways and Carriage Company.

**Mr. H. F. Friederichs,** electrical engineer to West Hartlepool Council, has had his salary increased, without application for an increment, from £450 to £500, in recognition of the great amount of work which had fallen upon him in connection with the scheme for utilising waste heat from the local blast furnaces. It was stated by Alderman Macfarlane on September 2 that the waste heat plant had borne the whole burden of the electricity supply since August 2.

**Mr. Alex. Hannan,** of the general office staff, Wallasey Corporation tramways, after 12½ years' service, is leaving to take up an important position in Chile, and the occasion has been marked by three presentations. Mr. Hannan received from the general manager (Colonel R. R. Greene, V.D.) a solid leather morocco lined attaché case; a massive silver cigarette case from the office staff; and a travelling trunk from the members of the Tramways and Electricity Departments' Employees' Social Club, of which club Mr. Hannan has acted as hon. secretary. The presentations were made by the general manager in the presence of representative gatherings of the staff, and from the reception accorded to him there can be no doubt that Mr. Hannan carries with him the goodwill of all connected with the undertaking.

**Mr. J. Shaw McCormick,** who for a period of four years was assistant manager of the Cavehill Tramways Company, has died at Belfast. When the Belfast Corporation took over the line Mr. McCormick was retained as manager of the new Bellevue Gardens at Glengormley.

## FINANCIAL REPORTS AND MEETINGS.

**Manila Electric Railroad and Lighting Corporation.**—A dividend of 1¾ per cent. ($1.75 per share) for the quarter ending September 30 has been declared on the common capital stock.

**Hurst Nelson and Company.**—The accounts for the year ended July, 1913, will permit of the arrears of preference dividend being paid up on November 11, 1913, together with dividend for the half-year ending on that date.

Digitized by Google

**Gateshead Tramways.**—An interim dividend at the rate of 5 per cent. per annum for the half-year ended June 30 has been declared on the ordinary shares. The interim dividends on the 5 per cent. and 6 per cent. preference shares will also be paid.

**The British Electrical Federation.**—The traffic statement for the week ended September 5, 1913, shows that the receipts from tramways and railways amounted to £41,013, as compared with £40,719 in the corresponding week last year, and from omnibuses £11,417, as compared with £831, making a total of £52,430, as compared with £41,550. The tramway and railway route mileage was 429.82, as compared with 431.52. The Federation now have 507 omnibuses, an increase of 415 within the year. Upon such of the services as were working, both last year and this year, the receipts show an increase of £1,850 upon the week.

**Oldham Tramways.**—The accounts of the Oldham Corporation tramways for the year ended March 31 last show a net balance of £4,549, which compares very favourably with the situation last year when there was a deficiency of £2,413. The total revenue was £108,000, and £15,458 has been placed to sinking fund. Over 21 million passengers were carried, and the average traffic revenue per car mile was 12.645d. The average fare per passenger came to 1.16d. There are 92 cars on the system. The gross capital expenditure has been £442,000, and £111,417 has been applied from the sinking fund in the reduction of debt. During the year the committee prohibited the display on the cars of alcoholic liquor advertisements.

**United Electric Car Company.**—The report of the United Electric Car Company, Limited, Preston, for the year ended June 30, states that after paying debenture interest amounting to £1,783, and charging £5,950 for depreciation, the profit for the year is £10,809, to which is added £4,249, brought from last year, making a total of £15,058. After deducting £3,000 for preference dividend for the six months ended December 31, 1912, there is an available balance of £12,058. The directors recommend its allocation as follows:—£3,000 to pay the preference dividend for the half-year ended June 30 last; £7,500 to pay a dividend of 5 per cent. on the ordinary shares for the year; and £1,558 to carry forward. Mr. Prestwick and Mr. Kerr, the two retiring directors, offer themselves for re-election.

**Darwen Tramways.**—The accounts of the Darwen Corporation tramways for the year ended March 31 last show that the traffic receipts on the Darwen section were £13,501. Just upon 2½ millions of passengers were carried. The mileage run was 219,000, giving an average income per mile run of 14.7078d. The expenditure totalled £9,387 (equal to 10.2713d. per mile run), which sum includes an allowance of £960 for depreciation. The gross profit of over four thousand pounds was carried to net revenue account. The net profit for the year was £558. On the Hoddlesden section the receipts were £1,805 and the expenditure £1,578, the latter figure including £150 placed to depreciation account. The gross profit on working was £316, but the net revenue account shows a net loss for the year of £452. Just over 209,000 passengers were carried. The mileage run was 33,355, giving an average income per mile of £1 1½d.

**Blackpool's Record Receipts per Car Mile.**—The annual report of Mr. Charles Furness, general manager, Blackpool tramways, states that the year's receipts were £74,166, and the gross profit £34,484. Compared with the previous year the receipts increased by £8,826, gross profit by £9,378, net surplus by £8,278, passengers by 1,083,491, and mileage by 107,286. Working expenses showed a decrease of £552. The receipts increased on all routes, the largest being on the circular tour, which amounted to £4,857. Postcards, advertising, and circular route realised £221, the profit being £77. The average receipts per car mile reached the record figure of 16.93d. The maximum number of cars run was 72, and the minimum 15, the average number of cars in daily use being 32. Permanent way expenditure out of revenue account amounted to £2,203, and £6,087 out of permanent way renewal fund. Mr. Furness points out that the expenditure on the permanent way is an increasing factor, and therefore it was desirable that a sum of not less than £10,000 be allocated annually to the fund for at least the next five years. Since the adoption of car meters and the keeping of a complete record, a considerable saving had been effected in the current consumption per car mile, which was 1.33.

**A Portsmouth View of Municipal Tramway Deficits.**—The accounts of the Portsmouth Tramways Committee for the year ended March 31 show that a balance of £10,057 has been allocated as follows:—£4,000 to the Borough Fund, £3,000 to the Fire and Insurance Fund, £350 for depreciation, and £3,306 for carrying forward. At the recent meeting of the Council Councillor Groves expressed pleasure that the cars had been "speeded up" to the speed allowed by the Board of Trade. There was more likelihood of the halfpenny fares coming by speeding up the cars than by any other means. They wanted to make it worth the while of busy people to use the cars. Councillor Taylor remarked that as the gross profits of the tramways were £57,000 at least £10,000 instead of only £4,000 should be handed over for the relief of the rates. During a discussion upon the advisability of halfpenny fares, Councillor Pink said the time was not opportune to take any risk by revising fares. At Glasgow, where they had halfpenny fares, there were eleven non-paying routes. Where halfpenny fares were made to pay was in the busiest portions. In Portsmouth the cars were only full during meal hours and at night. Out of 94 Corporation systems he pointed out that 54 were failures owing to the fact that they tried to give too much for the money.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 67 of the principal undertakings of the United Kingdom, including the lines owned by the British Electrical Federation, for the week ended September 6 amounted to £252,766, or £17,454 more than in the corresponding week last year, while the track mileage was 2,735, or 50 more than for the corresponding week. The receipts were at the rate of £92 8s. 4d. per track mile, an increase of £4 15s. 7d. per mile as compared with last year.

## COPPER AND ALUMINIUM MARKET.

September 12, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton:—

| | Friday, Sept. 12. | Last week. | A Year Ago. |
|---|---|---|---|
| | £ s. d. | £ s. d. | £ s. d. |
| Standard Copper (cash) .. .. | 72 15 0 | 73 7 6 | 78 10 0 |
| ,, ,, (three months) .. .. | 72 12 6 | 72 17 5 | 78 17 6 |
| Electrolytic Copper—bars or ingots .. | 77 5 0 | 76 5 0 | 81 15 0 |

THE

# Tramway & Railway World

Vol. XXXIV. No. 15. ] LONDON, SATURDAY, SEPTEMBER 20, 1913. [ Established in 1892.

ANNUAL SUBSCRIPTION (Postage Prepaid)—in the United Kingdom, 25s.; for all places abroad, 30s.

Including sixty-four issues, of which twelve are large illustrated numbers, printed on fine art paper.

## NOTICES.

**All Communications and Advertisements for next Saturday's issue should be received not later than 3 p.m. on Friday.**

**Advertisements for the next issue of which proof is desired should reach us by the second post on Wednesday.**

**The Editorial and Publishing Offices of "The Tramway and Railway World" are at Amberley House, Norfolk Street, London, W.C.**

**Telegrams: "TRAMIGRO, LONDON."**
**Telephone: No. 2948 GERRARD.**

## WEEKLY LIST OF TENDERS INVITED.

### ABERDEEN CORPORATION TRAMWAYS.

The Town Council of Aberdeen are prepared to receive tenders for :—

Six Complete Electrical Equipments for Double-Deck Cars.

Specifications may be had from the undersigned on application at the Tramways Office, Municipal Buildings, Aberdeen.

Tenders, endorsed "Tender for Complete Electrical Equipments," to be lodged at the Tramways Office, Municipal Buildings, not later than 12 o'clock noon on Wednesday, October 1, 1913.

The Town Council do not bind themselves to accept the lowest or any tender.

R. STUART PILCHER,
General Manager.

Corporation Tramways Office, Aberdeen,
September 17, 1913.

### LEICESTER CORPORATION TRAMWAYS.

UNIFORM CLOTHING.

The Committee invite tenders for the supply of about 500 Suits for Inspectors, Motormen, Conductors, etc., for delivery in April next.

Samples may be seen on application to, and tender forms obtained from, the Manager, 20 and 22, Humberstone Gate, Leicester.

Sealed tenders, endorsed "Tender for Suits," addressed "Chairman, Tramways Committee, Humberstone Gate, Leicester," must be delivered not later than Saturday, October 4, 1913.

The Committee do not bind themselves to accept the lowest or any tender.

A. F. LUCAS,
Manager.

September 13, 1913.

### LEICESTER CORPORATION TRAMWAYS.

TICKETS.

The Committee invite tenders for the supply of Passenger Tickets, with advertising rights, for 12 months, commencing January 1, 1914.

Specifications and conditions and forms of tender may be obtained on application at the Tramway Offices, Humberstone Gate, Leicester.

Tenders must be addressed to "Chairman, Tramways Committee, Humberstone Gate, Leicester," and must be returned not later than Saturday, October 4, 1913.

A. F LUCAS,
Manager.

September 13, 1913.

### SALFORD CORPORATION.

ELECTRICITY DEPARTMENT.

Tenders required by noon, September 29, 1913, for supply, delivery, and erection of Rotary Converters. Specification, etc., from the Borough Electrical Engineer, Electricity Works, Frederick Road, Pendleton, on receipt of deposit of two guineas.

### KEIGHLEY CORPORATION.

ELECTRICITY DEPARTMENT.

6,600 VOLTS THREE-PHASE ALTERNATING CURRENT TRANSMISSION LINE.

Tenders are invited for an Overhead Transmission Line in duplicate, suitable for conveying electrical energy at 6,600 volts, three-phase alternating current, frequency 50 cycles per second.

The length of the line will be slightly over two miles.

The line must be constructed in accordance with the latest model regulations of the Board of Trade for electric lines placed above ground.

Full particulars, and copies of the specification and form of tender, may be obtained on payment of a deposit of £2 2s., which will be returned on receipt of a *bonâ-fide* tender.

Extra copies of the specification may also be obtained at 10s. per copy, which will not be returned.

A route plan, showing pole positions and general lay out, can also be had at 10s. per plan, which will not be returned.

The latest date for receiving tenders will be the 1st October, 1913.

It is imperative that the work must be completed by the end of November, 1913.

Applications for tenders, etc., to be made in writing to the undersigned.

HARRY WEBBER, A.M.I.E.E.,
Borough Electrical Engineer and Tramways Manager.

Electricity Offices and Works,
Coney Lane, Keighley.

### LIVERPOOL TRAMWAYS CORPORATION.

CONTRACT FOR THE SUPPLY OF TICKETS.

The Tramways and Electric Power and Lighting Committee are prepared to receive tenders for three years' supply from the 1st January, 1914, of Passengers', etc., Tickets. The approximate quantity used per annum will be 150,000,000.

Copies of specification, general conditions, and form of tender may be obtained on written application to the General Manager, Corporation Tramways, 24, Hatton Garden, Liverpool, where standard samples of the tickets may be viewed any day (except Saturday and Sunday) between the hours of 9 a.m. and 5 p.m.

The Corporation do not bind themselves to accept the lowest or any tender.

Tenders must be posted in the official envelope provided, duly sealed, addressed to the "Town Clerk, Municipal Buildings, Liverpool," and endorsed "Tender for Tickets," so as to be received not later than 10 a.m. on Thursday, September 25, 1913.

EDWARD R. PICKMERE,
Town Clerk.

### WALTHAMSTOW URBAN DISTRICT COUNCIL.

ELECTRICITY DEPARTMENT.

CONTRACT "V."—LOW-TENSION CABLE.

The above Council invites tenders for the supply and delivery of Low-Tension Feeder Cable.

Specifications and forms of tender may be obtained from Mr. G. R. Spurr, Electrical and Tramways Engineer, Electricity Works, Priory Avenue, Walthamstow, by depositing the sum of one pound, which will be returned on receipt of a *bonâ-fide* tender, and to the successful contractor on the completion of the contract.

Sealed tenders, upon the forms supplied, endorsed "Tender for Cable," must be delivered by post only to the undersigned, not later than 12 o'clock noon on Wednesday, October 8, 1913.

The Council do not bind themselves to accept the lowest or any tender.

C. SYDNEY WATSON.
Clerk to the Council.

Town Hall, Walthamstow,
September 17, 1913.

Digitized by Google

## DUNDEE TOWN COUNCIL.

The Dundee Town Council are prepared to receive tenders for—

(1) The Construction of Tramways in Blackness Road, and

(2) The supply of 170 tons of Steel Tramway Rails and of Manganese Steel Points and Crossings and Steel Tiebars.

Plans may be seen and specifications, schedules of quantities, and forms of offer obtained at the Office of the Subscriber on depositing with him two guineas, which deposit will be returned on a *bonâ-fide* tender being lodged with Wm. H. Blyth Martin, Town Clerk, City Chambers, Dundee, not later than 10 o'clock a.m. on September 29, 1913.

The Town Council do not bind themselves to accept the lowest or any tender.

JAS. THOMSON,
City Engineer.

Municipal Offices,
91, Commercial Street, Dundee,
September 12, 1913.

## ELECTRIFICATION OF MELBOURNE SUBURBAN RAILWAYS.

The Agent-General for Victoria, Australia, is prepared to receive new tenders for the

20,000-volt High-Tension Switchgear,
Low-Tension Switchgear and Accessories

for the power station and sub-stations to be constructed in connection with the electrification of the Melbourne Suburban Railways now being carried out.

Specification and form of tender may be obtained from the Agent-General for Victoria on or after Monday, September 22, 1913. Any *bonâ-fide* tenderer requiring information in addition to that contained in the specification may apply to the consulting engineers, Messrs. Merz and McLellan, 32, Victoria Street, Westminster, S.W.

The charge for the specification is £5 5s. for the first copy and £2 2s. each for any further copies. Sums paid for copies will be refunded on receipt of a *bonâ-fide* tender for the whole of the works included in the specification.

Sealed tenders, marked "Electrification of Melbourne Suburban Railways—Tenders for Switchgear and Accessories," are to be addressed to the Agent-General and delivered at his office, Melbourne Place, Strand, W.C., not later than 12 o'clock (noon) on Monday, October 13, 1913.

The Government do not bind themselves to accept the lowest or any tender, and ample security will be required from the contractor whose tender is accepted.

## URBAN PASSENGER TRANSPORT.

A number of circumstances combine to render of exceptional interest the paper on urban passenger transport which Mr. J. B. Hamilton is to read at Sheffield on Thursday next. Within the past few months the Leeds manager and his colleague in the neighbouring city of Bradford have had to answer the question of what is likely to happen to the electric tramway system in view of the progress made by petrol vehicles. That this advance now affects the provinces as well as the metropolis is shown by the number of municipalities that have introduced the omnibus in the dual capacity of serving localities hitherto without the means of public locomotion and of acting as a feeder to the tramways. With the close of the municipal tramway year on May 31 next, some enlightenment upon the vexed question of total working costs calculated on the same basis as for tramways may be looked for. Another question likely to call for a decision will be that of road maintenance in places where the vehicles have been placed in service without any attempt having been made to provide suitable surfaces. This latter consideration will largely affect the popularity of the outside seats, for even on the smooth roads of central London it is something of a penance to undertake more than a quarter-of-an-hour's ride without the intervention of the padded seats of the interior of the vehicle. A number of provincial tramway companies have also invested in petrol motors, while the extended operations of more than one London combination now serve to place at the command of any municipality motor transport services without financial risk to the authority. It is somewhat surprising that advantage is not being more largely taken of this form of enterprise. Probably the reason is to be found in the fact that it is only during the past year that the scheme has been introduced. The question to which we have alluded was put to Mr. Hamilton by the Bristol Corporation in connection with the report he was asked, in conjunction with Mr. Snell, to place before them as to the proposal to obtain Parliamentary powers to enable them to work the tramways if the system is acquired from the Tramway Company in May, 1915, should the authority and the ratepayers decide in favour of that course. The two consultants were asked to take into consideration the chance of any alteration or improvement in electric or any other form of traction which would replace the present system. Their reply was that the Corporation possess a very valuable option, which it would be advantageous for them to exercise on May 1, 1915, in the absence of any important radical changes. In another column of this issue will be found the answer of Mr. Spencer to the question of the future of the tramways which he has put in his annual report. The Bradford manager's answer is less guarded, but it is none the less correct, and we would add that the omnibus will have to accomplish the task—seemingly impossible from a financial point of view—of using pneumatic tyres before there can be any talk of superseding the tramcar. Even then the supersession would only be for light traffic, while the petrol vehicle would still remain the more dangerous to life and limb. The use which the Bristol Tramways Company have made of the internal combustion engine, in order to provide new services and feeders, has not only increased the value of the tramways undertaking itself, but has provided corporations with a model system of combined tramways and omnibuses to which they would do well to direct their attention. To the London companies now seeking to open up new business in the provinces the report which Mr. Charles Challenger, the Bristol manager, prepared, showing the admirable manner in which the recent Royal Agricultural Show traffic was dealt with by tramcar and motor vehicle, should prove valuable.

## TRADE UNION TYRANNY.

There are some aspects of the strikes engineered by agitators that are seldom taken into consideration. The case, for instance, of the old members: Is it fair to these men to urge them to stand by their employers when by such loyalty they lose all the benefits of the union to which they have subscribed for many years? And why should they be loyal to an employer who is, oftener than not, an impersonal body—a board, a council, the management—whereas their fellow workers are individually known to them, and loyalty to "mates" is one of the characteristics of the British labouring man? The younger men, on the other hand, if they have recently joined, may get strike pay amounting to more than their contributions to the union; so they do not stand to lose much, and are tempted to exercise that fighting spirit, which is another of their characteristics. If by legislation, or by any other means, they could possibly recover what they have paid to the society, so that they would suffer no pecuniary loss by not coming out, the ranks of the strikers would be thinned to such an extent that the results of any cessation of work would be innocuous; indeed, the older men would probably form pickets to induce their younger brethren to go back to work. Blacklegs, knobsticks, or whatever they are called, should have their pockets protected as well as their persons. This contention is supported by the fact that individuals, if taken separately, will admit readily that they do not want to strike, but, if ordered to do so, they will have to come out, as they cannot afford to do otherwise. Unless some indemnity fund can be estab-

Digitized by Google

lished to make good any pecuniary losses to men who wish to be loyal to their employers, the "executive" will continue to rule with a rod of iron. There is another great difficulty in the way of would-be loyal men, which is that, when a strike occurs, many men besides the unionists are thrown out of work, and that, while the members of unions get strike pay, the outsiders get nothing, although they attend every day during the crisis and are idle against their will. Naturally they will be inclined to say, "We would be better off if we did join," and join they do accordingly. Considering the attitude taken by the public, as voiced by the Press in other cases, it is rather difficult to understand why the typical dispute with the London omnibusmen—although it is only over a badge—should have enlisted so much sympathy. Surely to enforce discipline is not "foolish." The British worker is a man of few words, and can be influenced by the sheer force of a fluent verbosity to which he cannot find language to reply or to refute on the spot; therefore he seemingly acquiesces in statements which he knows to be altogether wrong. Many of them detest this tyranny exercised by wind-bags, whom they despise at heart—but what can they do under present circumstances? It is all very well to talk about the degradation of slavery to their unions, the stupidity of quarrelling with their bread and butter, and the nobility of being true to their salt—but how are they to make good those savings which they have accumulated with so much toil, and those benefits to which they look forward? Of course, if the unemployment fund be made to apply to men on strike, there will be no occasion for anyone to work at all. Moreover, as it now appears plainly, there are other matters to be considered besides the badge question. The principle at issue from the first has really been the recognition of the union executive, for which they fight tooth and nail, and for ability to force all the workers into their organisation by hook or by crook; if they did not get this their occupation would be gone. To bring this about it is necessary that a non-unionist should be recognised at sight, in order that his life, and that of his dependants, may be made a burden to them by all and sundry members of unions. If these be not the reasons for the order to wear the badge, what are they? Surely if a man's uniform be provided for him it is only common sense that no departures from uniformity should be allowed except by consent. It would certainly appear as if the employers had made a mistake in giving way at all, although the matter seems so paltry. One paramount decision in all such cases is the point at which a stand should be made. It is evident that the sooner the contending parties can narrow the issues to some definite point and take their stand there, the sooner would there be a possibility of arriving at a solution satisfactory to both parties—and to the third party, who is apt to be forgotten in the noise of the strife—the public.

## THE FUTURE OF BRADFORD TRAMWAYS.

No Fear of Supersession by Existing Petrol-Propelled Vehicles.

Some interesting additions have been made by Mr. C. J. Spencer, general manager of the Bradford Corporation tramways, to his annual report on the working of the undertaking to March 31 last, as issued in booklet form. The financial details of this the fifteenth yearly report were noted in the issue of this journal for July 10 last. "The operating difficulties of the Bradford tramways system are of a rather extraordinary character," Mr. Spencer says. "From the commercial point of view the heavy operating expenses, due to steep gradients and constant wear and tear, are unavoidable, as is also the disadvantage of a very low density of population per route mile." Having regard to these difficulties the Corporation may congratulate themselves not only on having a good service of cars, but that in addition to meeting all dues and demands they are able to contribute annually a substantial amount to the relief of rates, pay good wages, and possess a reserve and renewals fund amounting to about £60,000. Only two fatal accidents have occurred during the fifteen years. Taken as a whole, Bradford may be said to be one of the "best trammed cities in the country."

Adverting to "what is likely to happen to the tramways system inside the next fifteen to twenty years," in which time the bulk of the financial liability of the Corporation, as far as the tramways are concerned, will have been paid off, Mr. Spencer states that it has been predicted by some who are qualified to speak, that the day is not far distant when the tramcar will be superseded by some better vehicle. The petrol-propelled vehicle has undoubtedly made great strides, but unless it develops a good deal more than seems at present possible he does not think it would supersede the tram in Bradford. There seems no reason to anticipate any radical change in transit methods for some years to come.

On the Bradford railless trolley car installation, one mile 460 yards in length, there is a loss shown on the face of the accounts. Whether this is a real loss or not it is impossible to say. The vehicles are of the pioneer type, and are to be replaced by more modern cars.

The outstanding feature of the accounts is the very gratifying increase in total revenue, notwithstanding the heavy decrease in fares for early morning traffic. The total revenue from all sources (excluding bank interest, rents, etc.), amounted to £299,102, compared with £289,335 for the corresponding period of last year. The expenditure (excluding interest, sinking fund, etc.), amounted to £200,552, compared with £180,135 in the previous year. During the year 62,005,076 passengers (175 times the population) were carried, compared with 56,352,281 the previous year. There are to be considerable extensions at the Thornbury depôt. A building for the accommodation of engineering, machinery, and blacksmiths' shop is now in hand at an estimated cost of £5,871. During the year the parcels department handled 716,157 parcels, compared with 625,914 in the preceding year.

"The Tramways Department has arrived," the report says, "at what may be termed the half-way house, inasmuch as the loans for tramway purposes were granted generally for thirty years, and, as will be seen from a perusal of the accounts of the City Treasurer, nearly half the capital borrowed for tramway purposes has been repaid."

## BELFAST TRAMWAYMEN'S PROFIT BONUSES.

Surcharge made upon Three Members of the Council.

Indignation has been created in Belfast by the action of an auditor of the Local Government Board of Ireland in having surcharged three members of the Corporation, who, by their signatures, authorised the payment in May, 1912, of the sum of £2,800 to the tramway employees as a bonus out of the profits of the undertaking.

The general manager (Mr. Andrew Nance), in his annual report, which came before the Corporation on May 1, 1912, pointed out that a new duty had been imposed upon him by the resolution passed by the Council on March 1, 1912, which read as follows:—"That the general manager be instructed that, after estimating at the commencement of each financial year the probable amount of profits, he is to fix, subject to the approval of the Committee and Council, the wages and salaries for the then ensuing year, the said wages being made up of (a) a fixed sum in each case, and (b) a certain proportion of profits, but taking care that the entire sum paid to each employee will not exceed such amount as would be payable, on purely commercial principles, in the interest of the ratepayers."

In accordance with that resolution, Mr. Nance having estimated the probable amount of profits, fixed, subject to the approval of the Committee and the Council, the wages and salaries for the ensuing year. Each member of the tramway staff, during his term of service, was to receive weekly or monthly, as the case might be, the fixed wages and salaries allotted to his post or position by the resolution of the Council dated March 1, 1912; and, in addition, those members of the existing staff who were continuously in the service of the department and paid by it from April 1, 1911, to March 31, 1912, were to have the sum of £2,800 equally divided among them, being a certain proportion of the estimated profits of the ensuing year, each payment of such equal share to be properly and individually charged to the various persons receiving the same as wages or salaries, receivable by them during the ensuing financial year.

Mr. Nance was of opinion that profit-sharing would give the men a stronger interest in their work, increase *esprit de corps*, and promote unity between the Corporation and their tramway employees. It is said that the effect of the surcharge will be that practically every worker in the service of the tramways in receipt of a weekly wage will have his allowance reduced by an average of about 1s. 9d. a week, which will be regarded as a real grievance. The Corporation hold that the bonuses are a perfectly legitimate charge, and that a similar scheme is, in fact, pursued in some Government departments. Before adopting the plan the Corporation obtained the opinion of Mr. Stephen Renan, K.C., an eminent member of the Irish Bar, as to the legality of the step, and on his advice the Corporation felt that they were entitled to regard the step as perfectly legal. The *Belfast News Letter* states that the surcharge will doubtless be the subject of legal proceedings.

# THE MUNICIPAL TRAMWAYS ASSOCIATION.

ANNUAL CONFERENCE.

More than seventy Corporations will be officially represented at the Conference of the Municipal Tramways Association which will be held at Sheffield on Wednesday, Thursday, and Friday of next week, under the presidency of Mr. A. R. Fearnley. The list of delegates is as follows :—

ABERDEEN.—Councillor J. A. Smith, chairman; Mr. R. S. Pilcher, manager.

ACCRINGTON.—Councillor T. Morley; Mr. H. Pilling, manager.

ASHTON-UNDER-LYNE.—Councillor R. S. Oldham, chairman; Mr. E. Holt, manager.

AYR.—Mr. P. S. Ferguson, chairman; Mr. W. Grant, manager.

BELFAST.—Alderman J. S. Finnigan, vice-chairman; Alderman J. Tyrrell, J.P.; Mr. A. A. Blackburn, engineer.

BEXLEY U.D.C.—Councillor Reid, vice-chairman; Mr. H. P. Stokes, manager.

BIRKENHEAD.—Councillor H. Hansall, chairman; Mr. C. Clarke, manager.

BIRMINGHAM.—Alderman Bowater; Councillor Barrow; Mr. A. Baker, manager.

BLACKBURN.—Councillor C. Higham, vice-chairman; Mr. J. H. Cowell, manager.

BLACKPOOL.—Councillor Milton Wilde, J.P., Mayor; Alderman Brodie, J.P., chairman; Councillor Holt, vice-chairman; Mr. C. Furness, manager.

BOLTON.—Alderman J. Miles, chairman; Councillor H. Hill; Mr. J. Barnard, manager.

BOURNEMOUTH.—Councillor A. Davis, chairman; Councillor R. F. Godfrey, vice-chairman; Mr. I. Bulfin, manager.

BRADFORD.—Councillor E. Priestley, chairman; Councillor S. C. T. Neumann, vice-chairman; Mr. C. J. Spencer, manager; Mr. T. Stirk, traffic superintendent; Mr. J. W. Falkingham; Mr. J. W. Dawson, assistant engineer.

BRIGHTON.—Alderman Wilson, chairman; Mr. W. Marsh, manager.

BURNLEY.—Councillor Heap, chairman; Councillor Irving, vice-chairman; Mr. H. Mozley, manager.

BURTON-ON-TRENT.—Mr. A. B. Slater, manager.

BURY.—Alderman Collinge, chairman; Councillor Hargreaves, vice-chairman; Mr. W. Clough, manager.

CARDIFF.—Alderman Sir J. W. Courtis, Kt., J.P.; Councillor A. J. Stone, vice-chairman; Mr. A. Ellis, manager.

CHESTER.—Alderman Jones; Mr. J. Gardner.

CHESTERFIELD.—Alderman E. Shentall, chairman; Councillor J. E. Clayton, vice-chairman; Mr. R. L. Acland, manager.

COLCHESTER.—Mr. R. C. Bullough, manager.

COVENTRY.—Councillor M. K. Pridmore, chairman; Councillor S. Bettman, vice-chairman; Mr. T. R. Whitehead, manager.

CROYDON.—Alderman J. Trumble, J.P., Deputy Mayor; Mr. T. B. Goodyer, manager.

DARWEN.—Mr. F. J. S. Hosken, manager.

DERBY.—Councillor J. Dean, J.P., vice-chairman; Mr. F. Harding, manager.

DUNDEE.—Councillor G. A. Johnstone; Councillor W. H. Buist; Mr. P. Fisher, manager.

EAST HAM.—Councillor W. T. Howlett, chairman; Alderman C. Northfield, J.P., Mayor; Mr. W. C. Ullmann, manager.

EDINBURGH.—Councillor J. Harrison, convener; Mr. A. H. Campbell, burgh engineer.

ERITH.—Mr. A. Coveney, manager.

GLASGOW.—Bailie Kirkland; Bailie Alston; Mr. J. Ferguson, chief engineer; Mr. L. Mackinnon, traffic superintendent.

GLOUCESTER.—Mr. L. Johnstone, manager

HALIFAX.—Councillor C. F. Spencer, chairman; Councillor A. Fawcett, vice-chairman, Councillor A. Seed; Mr. J. D. Caird, traffic manager; Mr. J. W. Galloway, engineer.

HUDDERSFIELD.—Alderman J. H. Aston, J.P., chairman; Alderman J. Taylor, vice-chairman; Mr. R. H. Wilkinson, manager.

HULL.—Alderman E. Robson, J.P., chairman; Councillor J. Hargreaves, J.P., vice-chairman; Mr. W. J. McCombe, manager; Mr. J. Wilkinson, electrical engineer.

ILFORD U.D.C.—Mr. L. E. Harvey, manager.

ILKESTON.—Alderman Shaw, chairman; Councillor W. Tatham, vice-chairman; Mr. L. C. F. Bellamy, manager.

LANCASTER.—Councillor Wilkinson; Mr. G. C. Milnes, manager.

LEEDS.—Alderman Brown; Alderman Tetley; Mr. J. B. Hamilton, manager.

LEICESTER.—Alderman S. Flint, J.P., chairman; Alderman G. Banton, J.P., vice-chairman; Mr. A. F. Lucas, manager; Mr. T. R. Smith, electrical engineer.

LEITH.—Judge Hall; Mr. F. A. Fitzpayne, manager.

LIVERPOOL.—Alderman F. Smith, chairman; Major R. J. Clarke, vice-chairman; Mr. C. W. Mallins, manager.

LONDON C.C.—Mr. W. J. Squires; Mr. A. L. C. Fell, chief officer.

LOWESTOFT.—Mr. H. H. Saunders, manager.

MANCHESTER.—Alderman Bowes, chairman; Councillor A. W. Chapman, vice-chairman; Mr. J. M. McElroy, manager.

MAIDSTONE.—Councillor Lyle; Mr. A. T. Lambert, manager.

NEWCASTLE-ON-TYNE.—Councillor J. H. Rodgers, chairman; Councillor R. Mayne, vice-chairman.

NEWPORT.—Mr. John Moxon, chairman; Mr. N. J. Young, manager; Mr. A. Nichols Moore, electrical engineer.

NORTHAMPTON.—Chairman; Vice-Chairman; Mr. J. Gottschalk, manager.

NOTTINGHAM.—Chairman; Vice-Chairman; Mr. J. Aldworth, manager.

OLDHAM.—Councillor F. G. Isherwood, J.P., chairman; Alderman F. Elliott, vice-chairman; Mr. J. W. Dugdale, manager.

PERTH.—Councillor J. Moncrief, chairman; Mr. W. S. Snell, manager.

PLYMOUTH.—Mr. C. R. Everson.

PRESTON.—Councillor Crompton; Councillor Ormrod; Mr. J. F. Simpson, manager.

RAWTENSTALL.—Alderman Coupe, chairman; Mr. C. L. E. Stewart, manager.

READING.—Alderman C. G. Field, Mayor; Mr. G. F. Craven, manager.

ROCHDALE.—Councillor J. P. Fielden, chairman; Alderman Wm. Cunliffe, Mayor; Mr. G. Webster, manager.

ROTHERHAM.—Mr. Ed. Cross, manager.

SALFORD.—Alderman H. Linsley, chairman; Councillor Littler; Mr. G. W. Holford, manager.

SHEFFIELD.—Alderman Sir Wm. Clegg, chairman; Councillor A. T. Bescoby, vice-chairman; Alderman J. Knowles, chairman Engineer Committee; Mr. A. R. Fearnley, manager; Mr. H. E. Yerbury, electrical engineer; Mr. A. Handford, traffic superintendent.

SOUTHPORT.—Councillor T. S. Richardson, chairman; Councillor J. Champion, vice-chairman; Mr. T. J. Kendrew, manager.

SOUTH SHIELDS.—Councillor J. W. Henderson, Mayor; Mr. W. T. Robson, manager.

STALYBRIDGE.—Alderman R. Wood, deputy chairman; Mr. F. Schofield, commercial manager; Mr. R. Blackmore, chief engineer.

STOCKPORT.—Alderman C. Sharples, chairman; Alderman W. E. Hamnett, vice-chairman; Mr. A. T. Eardley, manager.

SUNDERLAND.—Councillor G. New, J.P., chairman; Councillor W. Walker, vice-chairman; Mr. A. R. Dawson, manager.

WALLASEY.—Councillor J. Farley, chairman; Lieut.-Col. R. R. Greene, manager.

WALSALL.—Alderman J. Cope, chairman; Alderman J. Williams, vice-chairman; Mr. R. L. Horsfield, manager.

WALTHAMSTOW U.D.C.—Councillor E. Samuels, chairman; Mr. W. Murray, manager.

WARRINGTON.—Alderman Smethurst, chairman; Councillor Wilkinson; Mr. J. Telfer, manager.

WEST HAM.—Alderman W. G. Spittle, J.P., Mayor; Alderman H. W. Littler, chairman; Mr. J. S. D. Moffett, manager.

WEST HARTLEPOOL.—Mr. C. Burgess.

WOLVERHAMPTON.—Alderman S. Craddock, vice chairman; Mr. W. A. Luntley, manager.

YORK.—Mr. J. W. Hame, manager.

# MISCELLANEOUS NEWS AND NOTES.

**A Bradford Experiment.**—Further experiments are to be made on the Bradford tramways of a three-halfpenny fare.

**Transfers at Nottingham.**—The innovation of three-halfpenny transfer tickets has been started by the Nottingham Tramways Committee.

**Aberdeen Extension.**—The City Council have agreed to apply for a Provisional Order for the extension of the tramway system, and for further borrowing powers to the extent of £50,000.

**Proposal to Purchase Greenock Tramways.**—On September 16 the Town Council deferred for a month the discussion of a motion to give notice to the Greenock and Port-Glasgow Tramway Company that the Corporation has decided to exercise the option to terminate the lease of the undertaking on May 15, 1914.

**The Trouble at Dublin.**—Beyond one or two attacks on cars by roughs the tramway strike trouble has ended, but something like 20,000 workpeople have been locked out by other employers who are bent on destroying the influence of the agitator Larkin. The fund for rewarding the loyal tramwaymen has nearly reached a total of £1,000.

**Brill Trucks for New Cars at Aberdeen.**—The Tramways Committee have adopted a report received from Mr. R. S. Pilcher, general manager, requesting that six additional top-covered cars be provided to cope with the increased traffic in the city. Authority was given to order Brill trucks, and to receive tenders for the electrical equipment.

**Weymouth Public Transit Problem.**—Mr. Geo. Conaty, formerly manager of the City of Birmingham Tramway Company, and now a consulting engineer, offered his services to the Weymouth Council to advise in the matter of cheap traction facilities by either railless trolley traction or by motor omnibus. Alderman Pye moved that the offer should be considered by the Motor Omnibus Committee, who had the question of a motor service in hand; but an amendment was adopted for the letter to remain on the table.

**Stirling Electrification Scheme.**—The Town Council on September 16 received a letter from Mr. G. Balfour, of Messrs. Balfour, Beatty, and Co., regarding his proposals for the electrification of the tramways. He said that he was prepared to pay the sum of £28,642 for the electricity undertaking to cover the unreedemed debt on the undertaking, an additional sum of £2,250 to refund the Council the difference in accumulated debit balances, accumulated up to the year 1908, and the credit balances carried to reserve since that date; and, in addition, a sum in cash of £2,000, making a total of £32,892. Mr. Balfour also promised a reduction in the charges for current. The matter was adjourned for consideration.

Digitized by Google

**Manchester All-Night Service.**—Although hardly more than a third of the people who signed the memorial in favour of the all-night hourly service have made use of the cars, Alderman Bowes, chairman of the Tramways Committee, states that they intend to go on with the facilities for three months, keeping an accurate account of the cost and use. The committee did not expect a profit, but did not want a serious loss.

**South Yorkshire Tramway Scheme.**—Wath, Bolton, Wombwell and Thurncoe Councils are combining in the consideration of a joint municipal tramway scheme, with possibilities of extension in the direction of Mexborough and Barnsley. Mr. J. L. Hawksworth, clerk to the Bolton-upon-Dearne Council, has been appointed clerk to the joint authorities. In connection with the scheme, Messrs. Bury and Walkers have been appointed solicitors. A well-known Westminster engineer is acting as adviser to the authorities.

**Sheffield Tramways and the University.**—A deputation representing the Sheffield University have waited on the Tramways Committee to urge the claims of the University for a grant in aid of the scheme for the extension of the University buildings. The Tramways Committee have decided that it is for the public benefit that the application should be complied with, and they recommended the Council to make a grant of £1,000 per annum for a period of ten years, as empowered under the local Tramways Act. The City Council have agreed to the proposal.

**The Colour of the Car.**—Manchester is discussing the æsthetic tramcar. One paper alluded to the "unique inappropriateness" of the colour of the local cars, and now a correspondent writes:—"There are no better or brighter cars within fifty miles of Manchester. Compare our cars with those of Liverpool and many other of our Lancashire towns, and I am sure Manchester cars will give them all the go-bye. What is the objection to having bright-looking cars in our streets? Your critic compares the colour of Salford cars, and praises the 'quietness' of it; but I notice that they are changing the colour to one very similar to ours, and I am pleased to see it, for chocolate brown does not suit dingy streets, particularly on a wet day."

**Electric Welding.**—The Sheffield Corporation are adopting electrical welding in connection with its tramways. The method is the "Tudorweld," carried out by the Tudor Accumulator Company, of Westminster. The weld is being applied to rails which are worn at the joints, but which are otherwise in a good condition. The worn piece at each joint is cut out, and a fresh piece of rail is fitted to fill up the gap completely, and then all the parts are electrically welded together. The welding of rails by other processes has been carried on in Sheffield during the last three years, and although many of the welds were done during the hot summer of two years ago, and there are now some thousands of welded joints in use, there has not been a single breakage. In Liverpool and Glasgow also, it is stated, the process has proved very successful.

**Edinburgh Tramway and Omnibus Proposals.**—The City Council on September 16 received a report by a sub-committee on a motion to consider and report as to the routes to be adopted for motor 'bus service, and as to the arrangements to be made for the purchase of the necessary 'buses. A sub-committee was appointed to have a consultation with the Tramway Company with regard to the running of 'buses in the city. The burgh engineer was directed to prepare a report on a motion in favour of obtaining a Provisional Order for the extension of the tramways to Redford Barracks and the Dreghorn district. Arising out of a motion by Councillor Deas to consider and report as to the expediency of making tramway extensions beyond the city boundaries, an instruction was given the Town Clerk to bring his 1905 report regarding extensions beyond the city bounds up to date. The sub-committee was instructed to consult with the Tramway Company also on the subject of extension to Corstorphine.

## CONTRACTS AND ORDERS.

**Walsall Council** have accepted the tender of Messrs. Letts and Airston for extending the tramway offices

**Bexley Council** have accepted the offer of the Hart Accumulator Company, Limited, for renewing and enlarging the battery, at £500.

**J. W. Courtenay, Limited,** have been re-appointed sole advertising contractors to the Liverpool Corporation tramways for a long term of years.

**The Canadian Westinghouse Company** have received a contract for the supply of three generators for the Winnipeg municipal power house.

**An Electric Tower Wagon.**—Ilford Council have decided to purchase a motor tower wagon, at £689, from the Edison Accumulators, Limited.

**Ilford Council** have placed an order with the British Insulated and Helsby Cables for a mile of tramway trolley wire at 9 9-16d. per lb., less 2½ per cent. discount.

**Lincoln Council** have allotted contracts as appended:—Willans and Robinson, Limited, turbo-alternator; Howden Boiler Company, water-tube boiler; Geo. Robson and Co., coal-elevating and conveying plant; Thornhill Bros., extensions to the electricity works.

**Burnley Council** have placed a contract with the British Insulated and Helsby Cables, Limited, for the supply of 1,000 yards of lead-covered cable, and with the British Thomson-Houston Company for the supply of electric motors required by the Electricity Committee up to March next.

**Bexley Council** have agreed to a recommendation made by the tramways engineer for fifteen of the cars to be equipped with trucks of the type selected by him, at a cost of £48 per car. £20 of this sum has been sanctioned by the Board of Trade as being necessary for the fitment of electro-mechanical track brakes. It is estimated that the new trucks will effect a saving in cost of maintenance of trucks (this item at present costs £120 per annum), a saving of at least 10 per cent. in current consumption on the cars, a saving in maintenance of cars and permanent way in consequence of the easier running of the cars, and the scrap value of old material superseded. The question of placing top covers on six cars at a cost of £115 per car was deferred for three months. Councillor White said that it was important that there should be some protection for passengers in the winter, and moved that the engineer report on the advisability of fixing removable awnings. The chairman said that the engineer informed him that the police would not allow that, and the amendment was not pressed.

## PERSONAL.

**Sir John Courtis,** chairman of Cardiff Tramways Committee, spent the vacation in America.

**Mr. C. W. Shepherd,** manager of the Edinburgh tramways, recently underwent an operation for appendicitis at the Isle of Man, while on holiday. The operation was in every way successful, and Mr. Shepherd is progressing favourably.

**Mr. W. N. Brooks,** traffic superintendent, Brighton Corporation tramways, on his own application supported by the Tramways Committee, has had his salary increased to £169 per annum. He was appointed in March, 1909, and has since received two increases.

**Mr. W. German,** who for fourteen years has been connected with the engineering and traffic departments of Blackpool Corporation tramways, has been presented with a gold watch by his colleagues on the occasion of his departure to fill another local appointment. In making the presentation Mr. Charles Furness, the borough electrical and tramways manager, said he was glad to learn that Mr. German had improved his position. It was on such occasions as applying for new positions that character counted, and he was happy and proud to say that the men of the Blackpool tramways department had a very high standard of character.

**Mr. Leonard Johnston,** general manager and electrical engineer, Gloucester Corporation tramways, was on September 12 appointed tramways manager at Southampton out of 38 applicants, and will enter upon the appointment about the middle of October. The salary is £400 per annum. A sub-committee had also interviewed selected candidates at Stockport, Ilford, Walsall, and Hull, and when the recommendation came before the Council an amendment was proposed in favour of directing the committee to bring up three names for selection. This was lost. Mr. Johnston was called before the Council and answered a number of questions. Mr. Johnston has been at Gloucester since January, 1909, and under his management considerable improvements have been made in the service, while the financial position has also improved. He was formerly connected with the Blackburn tramways.

**Mr. R. L. Horsfield,** tramways manager to Walsall Council, was recommended by the Tramways Committee for an increase in his salary from £400 to £500 by half-yearly increments of £25. The General Purposes Committee disapproved of the recommendation, but at the September meeting of the Corporation Ald. J. Cope, chairman of the Tramways Committee, moved an amendment that his committee's recommendation should be approved, and observed that the manager had earned their confidence during the ten years he had been with them. He was well able to carry on the work at a great profit, and a greater profit in the future. Alderman Cope pointed to the heavy work Mr. Horsfield had done, having had charge of all departments, and said there had been a very great increase in the amount of work since the tramways manager's connection with the Corporation. Alderman Williams, in supporting, said had not Mr. Horsfield withdrawn his name as a candidate for the position of tramway manager for Southampton he would no doubt have been elected. Councillor Talbot remarked that but for the services of highly-technical and highly-skilled men labour would be nowhere, and he asked that consideration should be given to the recommendation. The amendment was lost by 12 votes to 15, the report being approved.

**Mr. James Farley,** whose death was announced on September 13, at the age of 36, at New York, was a specialist in breaking down street car strikes. He was originally a tramway man in Philadelphia, and, it is said, came out on strike. The strike failed, and Farley's wife died from the hardships she had to endure. From that day Farley devoted his life to fighting the trade unions. At first he offered only his own services, but he soon saw the commercial possibilities of strike-breaking. He organised a staff of men who were at the same time skilled workmen and were armed with revolvers, and paid them a retainer of 4s. a day. It is stated that he has left a fortune of £100,000.

## FINANCIAL REPORTS AND MEETINGS.

**Winnipeg Electric Railway Company.**—A quarterly dividend of 3 per cent. is announced, payable October 1.

**British Electric Transformer.**—An interim dividend at the rate of 6 per cent. per annum has been paid on the ordinary shares.

**Lima Light, Power, and Tramways Company.**—The board announce a dividend of 1 per cent. for the second quarter of the current year.

Digitized by Google

**Dick, Kerr and Co.**—A final dividend of 3 per cent. has been declared on the six per cent. cumulative preference shares, payable October 1.

**Gateshead and District Tramways Company.**—The directors announce an interim dividend at the rate of 5 per cent. per annum on the ordinary shares for the half-year.

**The British Electrical Federation.**—The traffic statement for the week ended September 12, 1913, shows that the receipts from tramways and railways amounted to £42,199, as compared with £38,596 in the corresponding week last year, and from omnibuses £13,221, as compared with £697, making a total of £55,420, as compared with £39,293. The tramway and railway route mileage was 429.82, as compared with 431.52. The Federation now have 511 omnibuses, an increase of 419 within the year. Upon such of the services as were working, both last year and this year, the receipts show an increase of £4,225 upon the week.

**Ayr Tramways.**—In his annual report on the working of the Ayr Corporation electric tramways the general manager (Mr. W. Grant) states that the total revenue for the year amounted to £16,295, being the highest in the history of the department. The passengers numbered 3,880,850, an increase of 3.62 per cent. Halfpenny fares represented 55.33 per cent. of the passengers and 28.63 per cent. of the receipts, penny fares 17.86 and 18.49, and twopenny fares 12.29 and 25.46 respectively. The net balance amounted to £3,378, of which £2,040 was carried to the depreciation and renewals fund and £1,337 transferred to the burgh general assessments. The depreciation and renewals fund amounts to £9,918, while there is also a reserve fund of £5,000.

**Aberdeen Tramways and the Common Good.**—Aberdeen tramways department pay an annual rent of £20 per mile to the Common Good as rent for the use of the streets on a portion of the lines, constructed by the company prior to 1888 and extending to 8.86 miles, the annual payment being £177. The surplus revenue, after meeting working expenses, renewals, depreciation, and all other charges, is, in terms of the Tramways Acts, meantime carried to a reserve account to provide for deficiencies and contingencies. The Council, however, have resolved to make application to Parliament for power in any year to appropriate and apply a sum not exceeding one-third of the free surplus revenue for that year to the Common Good, or towards the reduction of the rates, or in carrying out such improvements as the Council may determine.

**United Electric Car Company.**—The annual meeting was held at Preston on September 17. Mr. Robert L. Barningham, the chairman, said the past year's working was not so satisfactory as that of the previous year. The net profit on that occasion was the best since 1907, viz., £15,267. The past year had certainly not been a boom year in the demand for tramcars, and in the circumstances the directors considered the net profits of £10,800 satisfactory. Such had been their anxiety to secure orders that they had often to take work at prices which, although showing a small margin of profit, did not really cover the extra prices of materials. The keen competition had mainly affected them for foreign work, and had come chiefly from American and Continental firms. The order books and prospects were slightly better than twelve months ago. They should take the earliest opportunity to build up their general reserve to provide for the loss in the realisation of the Hadley and Trafford Park works. The report was adopted, and it was decided to pay a dividend of 5 per cent. on the ordinary shares, and to carry forward £1,558. Messrs. R. H. Prestwich (Manchester) and J. Kerr were re-elected directors.

*(Continued from page 258)*

## CITY OF MELBOURNE, AUSTRALIA.

SUPPLY OF SINGLE-PHASE TRANSFORMERS.

Tenders are invited for the supply of six 60 k.v.a. and one 30 k.v.a. Single-Phase Transformers.

Copies of specification, conditions of tender and of contract and form of tender can be obtained on application to the undersigned.

Such application must be accompanied by a deposit of 5s., which will be returned on receipt of a *bonâ-fide* tender.

Tenders to be sent to the undersigned, endorsed "Tenders for Single-Phase Transformers," and must be received by them not later than 12 noon on Tuesday, October 7, 1913.

The Council reserves to itself the right, but does not bind itself, to accept the whole or any portion of any tender.

McILWRAITH, McEACHARN AND CO., PTY., LTD.,
Billiter Square Buildings, London, E.C.,
Agents for Melbourne City Council.

## POSITION VACANT.

### TORQUAY TRAMWAYS COMPANY, LTD.

PLATELAYER.

Applications are invited for the above position. Candidates must have experience in maintenance work, and must be able to, or willing to learn to, drive a car when required.

Applications, stating experience and wages required, together with copies of testimonials, to be forwarded to the undersigned.

H. HOLLIDAY,
Engineer and Manager.

Car Sheds, Torquay.

**Ilford's Position Against Competition.**—Mr. Harvey, the manager of Ilford Council tramways, has reported that there was a deficit of £2,000 on the past year's working. Personally, however, he was optimistic about the future. Since the 1st of April they had carried more passengers to date than they carried in the corresponding period of last year. The chairman (Councillor Cullis) said the public must realise that, although they had been mulcted to a slight extent as far as their rates were concerned, but for the existence of the tramway undertaking that amount of money, and more than that, would go out of their pockets in the way of fares to opposition companies, who would have an entire monopoly.

## COPPER AND ALUMINIUM MARKET.

September 19, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton :—

| | Friday, Sept. 19. | Last week. | A Year Ago. |

# Tramway & Railway World

Vol. XXXIV. No. 16. ] LONDON, SATURDAY, SEPTEMBER 27, 1913. [ Established in 1892.

ANNUAL SUBSCRIPTION (Postage Prepaid)—in the United Kingdom, 25s.; for all places abroad, 30s.

Including sixty-four issues, of which twelve are large Illustrated numbers, printed on fine art paper.

## NOTICES.

**All Communications and Advertisements for next Saturday's issue should be received not later than 3 p.m. on Friday.**

**Advertisements for the next issue of which proof is desired should reach us by the second post on Wednesday.**

**The Editorial and Publishing Offices of "The Tramway and Railway World" are at Amberley House, Norfolk Street, London, W.C.**

**Telegrams: "TRAMIGRO, LONDON."**
**Telephone: No. 2948 GERRARD.**

# WEEKLY LIST OF TENDERS INVITED.

### BOMBAY, BARODA, AND CENTRAL INDIA RAILWAY CO.

The Directors are prepared to receive up to noon on Wednesday, the 8th October, tenders for the supply to this Company in Bombay of 18,000 Tons Best South Wales Steam Coal, or, by preference, one of the following varieties, viz:—

| | |
|---|---|
| Ferndale, | Powell Duffryn, |
| Albion, | Insole's Cymmer, or |
| Nixon's Navigation, | National Merthyr. |

Tenders for the supply of any coal on the Admiralty List will, however, receive consideration.

The coal is to be in all cases of the best quality mined, to be shipped under inspection on behalf of this Company, and to be delivered in Bombay by three equal instalments in December, 1913, and February and May, 1914.

Tenders must be made on forms to be obtained at these offices, and must quote prices in Indian currency per ton delivered. Payment will be made only in Bombay, and for the quantity delivered there, and if each instalment as above be not all shipped in one vessel, as follows, viz.: 90 per cent. on each cargo on completion of discharge, and the remaining 10 per cent., on due completion of such instalment of the contract.

The Directors reserve the right of dividing the contract between any two or more tendering firms, and do not bind themselves to accept the lowest or any tender.

C. CROMMELIN,
Secretary.

Offices: Gloucester House, 110, Bishopsgate, E.C.,
September 24, 1913.

N.B.—Other conditions being equal, preference will be given to tenders naming average discharge at Bombay at a rate not exceeding 500 tons per lawful working day, and Bills of Lading must contain the Company's usual delivery clause.

### ELECTRIFICATION OF MELBOURNE SUBURBAN RAILWAYS.

The Agent-General for Victoria, Australia, is prepared to receive new tenders for the

20,000-volt High-Tension Switchgear,
Low-Tension Switchgear and Accessories

for the power station and sub-stations to be constructed in connection with the electrification of the Melbourne Suburban Railways now being carried out.

Specification and form of tender may be obtained from the Agent-General for Victoria on or after Monday, September 22, 1913. Any *bonâ-fide* tenderer requiring information in addition to that contained in the specification may apply to the consulting engineers, Messrs. Merz and McLellan, 32, Victoria Street, Westminster, S.W.

The charge for the specification is £5 5s. for the first copy and £2 2s. each for any further copies. Sums paid for copies will be refunded on receipt of a *bonâ-fide* tender for the whole of the works included in the specification.

Sealed tenders, marked "Electrification of Melbourne Suburban Railways—Tenders for Switchgear and Accessories," are to be addressed to the Agent-General and delivered at his office, Melbourne Place, Strand, W.C., not later than 12 o'clock (noon) on Monday, October 13, 1913.

The Government do not bind themselves to accept the lowest or any tender, and ample security will be required from the contractor whose tender is accepted.

### KEIGHLEY CORPORATION.

ELECTRICITY DEPARTMENT.

6,600 VOLTS THREE-PHASE ALTERNATING CURRENT TRANSMISSION LINE.

Tenders are invited for an Overhead Transmission Line in duplicate, suitable for conveying electrical energy at 6,600 volts, three-phase alternating current, frequency 50 cycles per second.

The length of the line will be slightly over two miles.

The line must be constructed in accordance with the latest model regulations of the Board of Trade for electric lines placed above ground.

Full particulars, and copies of the specification and form of tender, may be obtained on payment of a deposit of £2 2s., which will be returned on receipt of a *bonâ-fide* tender.

Extra copies of the specification may also be obtained at 10s. per copy, which will not be returned.

A route plan, showing pole positions and general lay out, can also be had at 10s. per plan, which will not be returned.

The latest date for receiving tenders will be the 1st October, 1913.

It is imperative that the work must be completed by the end of November, 1913.

Applications for tenders, etc., to be made in writing to the undersigned.

HARRY WEBBER, A.M.I.E.E.,
Borough Electrical Engineer and Tramways Manager.
Electricity Offices and Works,
Coney Lane, Keighley.

### MANCHESTER CORPORATION TRAMWAYS.

The Tramways Committee of the Manchester Corporation are prepared to receive tenders for the supply of the following, viz.:—

(a) Permanent Way Special Trackwork.
(b) Permanent Way Points, Tongues, and Hardened Steel Centres.
(c) Granite Setts.

Specifications and forms of tender may be obtained on application to Mr. J. M. McElroy, General Manager, Corporation Tramways, 55, Piccadilly, Manchester. Applications for (a) or (b) must be accompanied by a deposit of £1 1s. for each specification, which will not be returned except on receipt of a *bonâ-fide* tender.

Tenders are to be addressed to the Chairman of the Tramways Committee, 55, Piccadilly, Manchester, and must be received not later than 10 a.m. on Tuesday, October 21, 1913.

The Committee do not bind themselves to accept the lowest or any tender.

THOMAS HUDSON,
Town Clerk.
Town Hall, Manchester,
September 24, 1913.

### COUNTY BOROUGH OF SOUTH SHIELDS.

CORPORATION ELECTRIC SUPPLY DEPARTMENT—CONTRACT NO. 87.

The Corporation invite tenders for the supply, delivery, and erection of

One 2,000 Kilowatt Turbine, Direct Coupled to Two 3-Phase Generators, in Tandem together, with Condensing Plant, Rotary Converters, Transformers, and Switchgear, etc.

Single copies of specification, general conditions, form of tender, and form of contract can be obtained on and after September 27, 1913, from Mr. Harry S. Ellis, Borough Electrical Engineer, South Shields, on payment of one guinea, which sum will be returned on receipt of a *bonâ-fide* tender. Further copies may be obtained at a charge of ten shillings per copy, which will not be refunded. Tenders on the form supplied, sealed and endorsed "Tenders for Steam Turbine Plant," must be delivered to me at my office, Municipal Buildings, South Shields, on or before noon of October 15, 1913. The Corporation do not bind themselves to accept the lowest or any tender, and any acceptance will be subject to the sanction of the Local Government Board being obtained to the carrying out of the work.

J. MOORE HAYTON,
Town Clerk.
September 22, 1913.

Digitized by Google

## COUNTY BOROUGH OF SOUTH SHIELDS.

CORPORATION TRAMWAYS DEPARTMENT.

The Corporation are prepared to receive tenders for the supply and delivery of Five or Ten Top-Covered Tramcars complete.

Single copies of the specification, conditions, and form of tender, and also form of contract can be obtained on application to Mr. W. Tuke Robson, Tramway Manager, Dean Road, South Shields, on payment of £1 1s., which sum will be returned on receipt of a *bonâ-fide* tender. Further copies may be obtained at a charge of 10s. per copy, which will not be refunded. Tenders, on the form supplied, must be delivered to me in the envelope provided, at my office, Municipal Buildings, South Shields, on or before noon on Saturday, October 25 next endorsed "Tender for Tramcars."

J. MOORE HAYTON,
Town Clerk.

September 23, 1913.

## COUNTY BOROUGH OF WARRINGTON.

ELECTRICITY DEPARTMENT.

The Electricity and Tramways Committee of the County Borough of Warrington are prepared to receive tenders for the following:—

1. Low Tension Cable.
2. Low Tension Feeder Panel.

Specifications and form of tender can be obtained from the undersigned on payment of one guinea for each specification, which will be returned on receipt of a *bonâ-fide* tender. Five shillings each will be charged for extra copies of either specification.

Tenders, addressed to the Chairman of the Electricity and Tramways Committee, Town Hall, Warrington, must be sealed with wax, and endorsed "Tender for Cable," or "Feeder Panel," as the case may be, and delivered not later than 12 o'clock noon on Tuesday, October 14, 1913.

The lowest or any tender will not necessarily be accepted.

F. V. L. MATHIAS,
Borough Electrical and Tramways Engineer.

Howley, Warrington.

## POSITION VACANT.

### BOROUGH OF ASHTON-UNDER-LYNE.

CHIEF CLERK.

The Tramways Committee invite applications for the position of Chief Clerk at a salary of £104 per annum.

Applicants must have had previous experience in the general offices of a Tramways Undertaking.

Applications, in applicant's own handwriting, endorsed "Clerkship," stating age and qualifications, accompanied by copies only of three recent testimonials, must be addressed to the undersigned, and delivered on or before the 6th October at noon.

The successful applicant will be required to join the Officers and Servants' Superannuation Scheme, particulars of which may be seen on application.

JOHN NEAL,
Town Hall, Ashton-under-Lyne. Borough Comptroller.

## TRAMWAYS AND MOTOR OMNIBUSES DISCUSSED AT SHEFFIELD.

The twelfth conference of the Municipal Tramways Association, which was held at Sheffield this week under the presidency of Mr. A. R. Fearnley, general manager of the Sheffield Corporation Tramways, was more numerously attended than any of the previous conferences, and in other respects it was also a thoroughly successful gathering. Some of those who went conscientiously through the programme described themselves as having condensed into three days experience what might have well filled a week. The work of the conference began on Wednesday morning, when the Lord Mayor cordially welcomed the delegates. Mr. Fearnley's presidential address, which was well received, formed an interesting and candid review of the tramway position to-day. On the outstanding question of the motor omnibus, Mr. Fearnley took the sane view that while there was no reason to anticipate the supersession of the tramway, he believed it to be advisable for tramway owners to experiment with omnibus services. That was being done in Sheffield, and interesting and valuable facts were being obtained. Alderman Flint's paper on platform fare collection was a description of what Leicester has done with the P.A.Y.E. system. He expressed the opinion that the system was an advantage to them, and in the course of the discussion it was stated that ten additional cars with the P.A.Y.E. arrangements were to be obtained. The discussion elicited no other new facts, but what may be termed the "standard objections" were insisted upon by those who have not yet tried the method which seems to be approved in Aberdeen and Leicester, where, of course, the conditions are somewhat exceptional. It cannot be said, however, that the adverse critics showed any hostility to the innovation, but rather a desire to learn whether their difficulties could be explained away. The maintenance of paving on tramway tracks was the subject of Councillor Fenton's paper, and the discussion emphasised the necessity of a change in legislation governing that matter. The question seems ripe for settlement, and it may be hoped that both tramway associations being in substantial agreement they may persist until the Government are forced to act. "Urban Passenger Transport," or Tramways *v.* Motor Omnibuses, was dealt with on Thursday morning by Mr. J. B. Hamilton in one of the most useful and conclusive papers that has ever been presented to the Municipal Tramways Association. Mr. Hamilton, as he said, has been connected with urban transport for some thirty years, and his experience has well qualified him to speak decisively. His recent exhaustive study of the motor omnibus position is set forth at length in his paper, and his conclusion is that generally speaking there can be no question of the superior advantages of the tramway. The "conviction stood out clear and distinct in his mind that the era of rail transit showed not the slightest sign of being superseded by any other form." Mr. Worby Beaumont, whose paper, recently read at the Imperial Transport Conference, was criticised by Mr. Hamilton, took part in the discussion, but his remarks did not seriously weaken the main conclusions established in the paper. Some of the figures given by Mr. Hamilton as to the relative costs of tramway and omnibus working may require to be modified as the omnibus is improved, but this will not materially affect the position. Hitherto the omnibus has had all the advantage that a permanent way provided without cost entails. When a fair adjustment of charges under this head is made, the position of the tramway will be immensely strengthened. Mr. Hamilton's paper comes at an opportune time and should do much to check the uninformed criticism of tramways that so often fills the columns of the daily newspapers.

## PROFIT SHARING AND BONUSES.

The situation which has arisen in Belfast in connection with the profit-sharing scheme for tramway employees is an interesting one. The men are paid fixed wages like other men, but they were, in addition, to receive bonuses, the amount of which would depend on the profits of the undertaking for each financial year, and would be 10 per cent. of such profits. Bonuses for freedom from accident, saving of electrical energy, good conduct, or what-not are familiar enough on British tramways, but the Belfast arrangement is a pure profit-sharing one, the amount to be paid, in addition to wages, to every man being the same. For 1912, the first year of the scheme, the amount available as the employees' share of the profits was £2,800, and this was shared out equally, every man from the manager downwards receiving £4 1s. 2d. Naturally, the arrangement gave much satisfaction to the employees, and it is one calculated to make them energetic and willing workers. If a tramway company were to adopt such a scheme, there could probably be no objection to it. The Belfast Corporation before adopting it took the opinion of eminent counsel, which was to the effect that the arrangement was legal. Now comes along the auditor of the Irish Local Government Board who declares it an illegal use of profits which belong to the ratepayers, and surcharges three members of the Council with the amount. Of course, the matter cannot rest there; an appeal is to be made to the Local Government Board, and probably there will be litigation if that is not successful. It is worth while noticing that in his last report the manager of the

Digitized by Google

Dewsbury Electricity Works proposes a profit-sharing scheme. If the final decision goes against Belfast Corporation, they will—unless there is some special difference in the law in Ireland—be able to fall back on the ordinary bonus system with which we are familiar in England. Experience has shown that so strong is the inducement of the bonus, which, by the way, is independent of what the profits may be, that an overwhelming proportion of the men earn it. To put it on a similar footing with profit-sharing, however, it must be applicable to other tramway employees as well as to the running staff. It is beyond question that profit-sharing or a bonus system is one of the most powerful instruments for securing efficient service and for minimising the risk of strikes. Moreover, it puts an interest hitherto little known into every man's work and it gives him a pride in it as a direct sharer in the revenues of the undertaking. One cannot but regret that the forward step taken by Belfast Corporation and Mr. Nance should have received a rude check, but it may be hoped that the check is only temporary, and that formal legal objections may be overcome. If not, then, as already noted, they may not be valid, even in Ireland, against a system of bonuses such as we have in England.

## MUNICIPAL TRAMWAYS ASSOCIATION.

### TWELFTH ANNUAL CONFERENCE AT SHEFFIELD.

About two hundred representatives of municipal tramway undertakings attended the twelfth annual conference of the Municipal Tramways Association (Incorporated) at Sheffield on Wednesday, Mr. A. R. Fearnley, the general manager of the Sheffield tramways, being the President for the year. The Corporation placed the Council Chamber of the Town Hall at the disposal of the conference, and the delegates were welcomed by the LORD MAYOR (Alderman Osborn), who also read a letter of welcome and apology for his own absence from Sir Wm. Clegg, the chairman of the Tramways Committee, who was at Wiesbaden. The Lord Mayor remarked that in Sheffield the tramways more than anything else had helped to solve what might have been a very serious problem of housing. Sheffield had been fortunate in having been served by two managers who had proved themselves to be at the forefront of their profession. Of Mr. Fell's inauguration of their present system the city had the most pleasurable and grateful recollection, and the way in which Mr. Fearnley had met the increasing demands and faced increasing difficulties had been beyond all praise. Sheffield had taken a foremost place in the supply of tramway requisites, and they had reason to believe that the city would retain that pre-eminence.

Councillor BESCOBY, vice-chairman of the Tramways Committee, supported the welcome, and remarked that if the experts assembled there had little to learn from Sheffield the city could at least show how journeys of three or four miles could be run for a universal penny fare.

Alderman J. MILES (Bolton) proposed a vote of thanks to the Lord Mayor and Corporation and Tramways Committee for their welcome and hospitality.

Mr. A. L. C. FELL (London), in seconding, said it was particularly gratifying to return to the city where he spent seven pleasurable years of hard labour, and to note that Sheffield had tried everything that could be tried in the tramway world, with the result that they had now the very best. (Applause.)

PRESIDENT'S ADDRESS—IMPROVEMENTS IN TRAMWAY OPERATION.

The PRESIDENT (Mr. A. R. Fearnley, general manager, Sheffield Corporation tramways), in the course of his address, gave the number of directions in which steady improvement and progress had taken place. Nineteen applications had been made since the last conference by municipalities for Provisional Orders relating wholly to or containing clauses as to tramways, motor omnibuses, or railless traction powers. In actual tramway operation, improvements were constantly being brought about. There was a tendency on all their systems to improve "running time." In Sheffield large sums were being spent in removing small equipments with which cars were fitted twelve or fourteen years ago, and replacing them with equipments double the size and of an improved type—the interpole motors having proved a success and now being generally adopted as more capable of coping with the heavier traffic requirements. In those towns which were early in the field with electric traction, car bodies were already being re-designed and re-constructed, giving easier and safer access, covered top decks and increased carrying capacity. Speeds were gradually being increased, with the consequent result that calls had been made upon the power house and permanent way branches of the department earlier than they would have been under the old condition of things. As a result of the experience gained, better work was being put into tramway tracks to-day. The mechanical joint was rapidly becoming obsolete, and welded joints, either electrical, Thermit, or cast, being almost universally adopted.

VALUABLE RESULTS FROM LINKING UP POWER STATIONS.

The idea of isolating the tramway power house from the other supply stations in the Sheffield district was, in consequence of the experience gained in many different parts of the country, now being abandoned, and in that city they hoped before the end of the year to have completed arrangements by which any of the three power houses would be available for tramway supply in case of heavy load and at other necessary times. In other words, the plant which was being used during 5½ days in the week to supply power to the large works in the east end of the city would be available for their week-end, bank holiday, and football traffic. The arrangement, which promised to work out in an economical manner for both the tramway and electric supply departments, was in the best interests of the city as a whole, and was certainly a necessary insurance for the continuity of the electric supply service of the city. Despite the cost of these extra payments and expenses, and increased wages, working costs were being kept at a very moderate figure, and they found themselves in the happy position of being able to provide, on their municipal tramways, cheaper passenger transport facilities than were to be found elsewhere.

PENNY STAGES, RATING, AND THE SELECT COMMITTEE ON MOTOR TRAFFIC.

There appeared to be growing up amongst the larger towns a keen rivalry as to which town should give the cheapest rides. The tendency appeared to be to gradually increase the length of the penny stage to distances which a few years back were thought impossible, and in those towns where this policy had been pursued for some length of time it could be said, with certainty, that, so far as financial results are concerned, and also in what is of more importance, so far as the interests of the municipality as a whole were concerned, the policy is sound. He ventured the opinion that it was one of the most valuable assets of all large towns to be able to transport their passengers a distance of three miles from the centre for a penny, and that very wide benefits were and would be derived from a policy of this description. Referring to the decline of 32 million passengers on the railways in 1912 the President said that in the same year tramways showed an increase of 220 million passengers. For some reason or other the electrification of English railways made little progress, or tramway managers would probably have cause to take a closer interest in their suburban traffic than they did at the present time. The reversal by Parliament of the House of Commons Committee's decision to give compulsory running powers on the London County Council tramways was a notable victory for the latter body, and might be useful to many other tramway authorities on future occasions. The decision of the Lords of Appeal on the rating of tramways was a disappointment, and meant a reversion to the previous heavy charge. Adverting to the report of the Select Committee on Motor Traffic in London, the President said it appeared clear from the report that if this traffic had been under municipal control the necessity for the Select Committee's appointment would never have arisen. The lesson to all provincial municipalities was clear, whether the street traction be tramways, 'buses, or trolley vehicles, they must do the work themselves, and thus ensure a service which they could control in every way. The essentials on which the Committee agreed were control by a Government department in consultation with local authorities. Whatever might be the opinion regarding Board of Trade supervision, municipal tramway operators would agree that for the last few years the Board had adopted a broad and wise policy in connection with its tramway work, by consulting and discussing with the representative associations alterations and innovations which had been necessary.

SUGGESTED EXPERIMENT IN SUBSTITUTING 'BUSES FOR TRAMWAYS.

If motor enthusiasts were any guide electric tramways were going to have a somewhat shorter life than either of their predecessors. It was quite clear that whatever the results of present developments might be, the leading municipalities intended still to control the systems of traction, and it remained for them to see that their sinking funds were in such a healthy state that they would be in a position to take advantage of any change that might be found to be advisable. There would, he was sure, be unanimity in supporting the resolution put forward by the Croydon and other Metropolitan Councils urging the Government to pass legislation to place motor 'bus companies on terms of equality with municipal tramways in regard to public obligations. A number of municipalities were now faced by the question of either extending their tramways or using the motor vehicle or trolley car. It was now more a problem of the road than the vehicle. On the other hand, there was a large mileage of tramway permanent way which required, or would shortly require, renewal. Here, then, was an opportunity for some authority to make an interesting and valuable experiment by taking an existing tramway route the traffic results of which were well known and deciding that the tramway service on this route should at least experimentally, if not permanently, be withdrawn and a suitable road surface be laid down, and motor 'buses or trolley vehicles substituted for the cars. There would be some advantages to the residents in the district selected, such as—a quiet running vehicle; the entire absence of the tramway rail; the probability of a more frequent service but with less saloon or covered accommodation; the opportunity for the road authority to provide an ideal surface for modern forms of traffic. Although, as far as he could see at present, there was little likelihood of the motor 'bus taking the place of the tramcar for heavy traffic, great improvements were likely to be made in the efficiency of the present vehicles. He did not suppose they would long continue to

Digitized by Google

use a gallon of petrol per 7½ miles run. A home produced motor spirit would give considerable impetus to the adoption of the motor 'bus in the provinces. He could not understand the hesitation of the London 'bus companies in declining to give publicity to the details of their working expenses. It would be a great advantage when reliable figures were published in detail under the form of tramway accounts, as he anticipated they would be early next year by a number of municipal tramway departments. Sheffield Tramways Committee had acquired ten 'buses since February last, and if reasonable use could be made of the vehicles during the winter months there was no doubt the Committee would require a much larger number of 'buses next summer. The President also mentioned that by the kindness of the Tramways Committees and general managers of Bradford and Rotherham examples of different kinds of railless trolley cars were to be seen during the conference working on a short length of a Sheffield tramway route.

Councillor J. H. RODGERS (Newcastle) moved the vote of thanks to the President for his address, and felt delighted that the tramway world had rallied round him in that exceedingly important conference, to which many were looking for a lead in tramway matters. He thought the presidential address did give a lead. Anyhow, it showed that they must move with the times and make progress. They must keep alive with the trackless trolley, the motor 'bus, or any other form of passenger locomotion.

Mr. J. ALDWORTH (Nottingham) seconded, and remarked that the address would repay quiet and careful study.

The motion was enthusiastically carried.

"ADVANTAGES AND DISADVANTAGES OF PLATFORM FARE COLLECTION."

Alderman S. FLINT, chairman, Leicester Corporation Tramways Committee, read a paper on the above subject. The tramways, in Leicester, all centred in the heart of the town; this makes it possible to charge universal penny fares on all the lines. After the conversion to electricity in 1904 the service was quickened, and the number carried increased at such a rate that the work of the conductors, especially at rush hours, became so onerous as to call for some alleviation. This led to a trial of the P.A.Y.E. system on the sections bearing the heaviest traffic. It was started six months ago, and had proved very satisfactory, The conductor collected the fares as the passengers boarded the car, and, except in the case of transfer and workmen's tickets, they were all put into a box on leaving; while the colour and plain signs on the tickets enabled the conductor to detect at a glance whether a passenger was over-riding. In the exceptional cases the tickets had simply to be shown. There were six varieties of tickets for the different through and cross lines on the whole system, and twelve for the P.A.Y.E. section. All these were reproduced in the paper. The accidents from passengers boarding or alighting from cars had been *nil* on this section in the last six months; the conductor never left the platform, and the cars ran to time. All the complaints had been met. One was that passengers on the upper deck had to leave their seats before reaching their destination. They were now allowed to leave by either staircase. Another complaint was that no accommodation was provided for luggage. This had now been provided. A third complaint was that the staircases were narrow and steep. The design had now been improved. Alderman Flint explained the system by which tickets for the two zones, for return, for children, for workers, and for transfers were issued and collected. The paper also included a photograph of the car, a diagram map of the tramway lines, and statistics from 1904 to the end of last year for the whole system and for the special section. The complete financial comparisons could not yet be made, but he could state that there had undoubtedly been an increase in the sectional receipts, quite equal to, and he thought in excess of, the average over the whole system. A number of deputations had visited Leicester to see the P.A.Y.E. system at work, and he had frequently been asked his opinion as to whether it would be workable in towns where the fares were varied and complicated. He could only say that at Leicester they had to deal with a complicated ticket system, and he thought there would be very little difficulty in adopting the P.A.Y.E. method to meet any requirements.

Councillor J. A. SMITH (Aberdeen) stated that the experience of the P.A.Y.E. system on one route in that city was in every way satisfactory. The number of passengers requiring change was only 5 per cent., and they were required at busy times to stand aside and give preference to the "ready money" passengers. The system had effected a saving in time of about one minute per journey—34.2 minutes per journey as against 35.1 minutes on the old system. The system which allowed the rear platform to take care of itself was, in point of public safety, behind the age—an opinion in which he was confirmed by the Chief Constable. Leakage in receipts was entirely prevented by the P.A.Y.E. system, under which the receipts had increased by over £23 per week.

Bailie ALSTON (Glasgow) asked how Alderman Flint's "colour scheme" would work out on a Glasgow route, where the fares varied from ½d. to 7d., and there were 35 halfpenny stages. How much of the £23 per week increase was attributable to natural increase. (Hear, hear.)

Mr. FELL asked what would be the cost of altering cars for operation on the P.A.Y.E. system. In Leicester they must breed a particularly thin conductor to get into the recess provided for him on the divided platform. (Laughter.) One of them explained to him that they were worked so hard that they had no chance to get fat. He had also noticed that in Leicester there was no bell for the upper deck passengers to give notice of their intending descent. If in London they had upper deck passengers wandering about between the stages the number of accidents would be trebled. There was also, he feared, a good deal of time lost at the starting, and in London the waiting passengers would be snapped up by the motor 'buses. (Laughter.) He hoped the system could be satisfactorily developed.

Mr. J. M. MCELROY (Manchester) said that in America the system had practically eliminated the payments of compensation for accidents, which formerly amounted to 5 per cent. of the receipts. He approved of the system in places where a universal or single system of fares obtained, but he doubted its applicability to large towns where there were many overlapping fares. On the latest type of car in America accidents were prevented by making passengers enter at the motorman's end, where the motorman lowered the steps and closed the doors before restarting the car.

Replying to the discussion, Alderman FLINT expressed his belief that in Leicester the system would enable 19 cars to do the work of 20 under the old method. He believed the motor 'bus companies were going to try it. Leicester paid £20 royalty on each car worked on the new system.

Mr. T. R. SMITH (Leicester) added that besides the royalty there was the cost of altering the platforms, etc., which worked out at between £30 and £40 per car.

A company of nearly 300 members and ladies partook of luncheon at the invitation of the Sheffield Tramways Committee, Councillor A. T. Bescoby presiding. Councillor A. J. BAILEY, in proposing the toast of the Association, remarked that during its existence municipal tramways had increased from 1,820 miles to 3,000, representing £53,000,000 of invested capital. Tramways had materially helped the solution of one of the great problems of democracy—getting the people from the slums to the suburbs, and he saw no reason why motor 'buses should not further assist that work.

Alderman H. LINSLEY (Salford), vice-president of the Association, acknowledged the toast.

UNFAIR CHARGES FOR TRACK PAVING.

The paper read on Wednesday afternoon was "The Maintenance of Paving on Tramway Track as affected by Section 28 of the Tramways Act, 1870," by Councillor Wm. C. FENTON, member of the Sheffield City Council. Mr. Fenton set forth very clearly the unfairness of the charges put upon urban tramway undertakings in the matter of rates, up-keep of road paving and road widenings; and illustrated his contention by figures taken from some of the largest undertakings. To these he added the number of workmen carried at non-paying fares—fares, indeed, with which no other present mode of transport can compare. He summed up the case for the tramways in a striking if rather quaint way: "Dealing with the question on its merits," he said, "we might repeat the old Latin phrase, 'Let justice be done if the heavens fall,' and although this is a contingency which may hardly be expected to happen, the sentiment is one which may well express the feelings of all just and upright men of sound judgment and reasonable opinion." The arguments for and against the repeal or revision of Section 28 of the Act of 1870 were summarised in twelve reasons given for such revision. Seven objections to such revision were answered categorically, and in conclusion the author gave five suggested remedies whereby the present inequitable conditions might be improved if they could not be abolished.

Councillor C. F. SPENCER (Halifax) commented on the injustice of the section of the 1870 Act. Municipal tramways were rated on their ability to pay; but the basis of rating under private ownership of, say, a factory, was in no way altered by an increase of business profits. Tramways paid practically the whole cost of the upkeep of narrow streets and other users paid nothing; he thought an equitable proportion would be for tramways to pay for maintenance between the tracks and nine inches on either side. He did not think the Road Board were warranted in hoarding up their funds for posterity; he believed the Board had about £3,000,000 so invested.

Alderman J. TRUMBLE (Croydon) said the proposal to tax 'buses would lead to serious difficulties; how could they differentiate between a 'bus and a commercial van?

Mr. W. J. SQUIRES (London County Council) expressed the confident belief that, given equal treatment to the 'bus companies, tramway undertakings would hold their own for all time. 'Bus companies should contribute towards road maintenance and rating.

Mr. W. J. HADFIELD (highways surveyor, Sheffield) said the city had no cause for complaint against the Road Board, from whom they had received altogether £30,000.

Mr. W. SMITH-SAVILLE (borough engineer, Darwen) said that since the advent of heavy motor traffic their main roads had cost £881 per mile as against £342 previously.

The discussion was also contributed to by the Mayor of Rochdale (Alderman Cunliffe), Bailie Alston, Mr. J. B. Hamilton, Judge Hall (Leith), Mr. H. Mozley (Burnley), and Mr. H. M Sayers (Tramways and Light Railways Association).

Mr. HARRY ENGLAND (Tramways and Light Railways Association) pointed out how serious the question had become in industrial areas, owing to the rapid growth of heavy motor traffic. He suggested that the Tramways Act of 1870 as a whole required revision. The Tramways and Light Railways Association had determined to make a strong effort to obtain such new legislation as would simplify and cheapen the method of obtaining concessions for new tramways, and thus enable the public to secure advantages urgently required, and he urged that the Executive Committee of the Municipal Tramways Association should co-operate with the other association.

Digitized by Google

Mr. C. J. SPENCER (hon. secretary) explained that at the July meeting of the Association a resolution was passed instructing the Executive to take such steps as will result in more equitable legislation with regard to the whole question of road maintenance, and to act if necessary with other associations.

URBAN PASSENGER TRANSPORT.

On Thursday morning a paper by Mr. J. B. HAMILTON, general manager Leeds Corporation tramways, dealt with "Urban Passenger Transport." The author epitomised the position in two sentences: "The motor 'bus has seven times the number of fatal accidents per vehicle per annum and twice as many injuries per million passengers as compared with tramways. Its obstructive street condition in fine weather is as two 'buses to one tramcar, and in inclement weather as four 'buses to one tramcar, whilst the cost to a municipality of providing transit by motor 'buses is double the amount per seat provided by electric tramways." In seven appendixes four comparative statements were given showing the results of operation in 27 towns of over 150,000 in population, as compared with the result assuming transport was effected by means of motor 'buses. The author also gave a diagram of the actual operating conditions of tramway service, and an estimate of motor omnibus service on the supposition that the latter had an earning capacity of 80 per cent. of a tramcar: in this the drop in the number of passengers carried at certain times compared with the seating capacity of the vehicles was clearly due to what might be termed "return empties" during and following rush hours. After enumerating the many and ever-increasing advantages that had followed the introduction and working of tramways, Mr. Hamilton took up the question of motor 'bus competition. At present these vehicles could not take the place of tramways, which would only give way to some system superior to them in every respect. The opinions of Lord Montagu and of Mr. Worby Beaumont were brushed aside. As to the latter—"it seems as if all his arguments were like his roads—to be merely composed of good surface." Mr. Fenton's excellent paper was quoted as showing that a very large proportion of the commercial and general traffic was carried on the portions of the road used by the tramcars. A careful perusal of Mr. Pott's paper at the Tramways and Light Railways Association led Mr. Hamilton to this conclusion; that the author "accords to the motor 'bus a position to which it is not justified on financial results on account of the present higher prices of petrol and the want of a provision for depreciation." The 27 towns treated in the appendix had an aggregate revenue of over 7¾ millions earned by some 4,000 cars at work out of about 5,700; giving an annual revenue per car of £1,594. The total expenses of over £5,600,000, and the total mileage of about 146,811,000, gave an average cost per mile for expenses of 9.167d. on 36,740 miles a year per car. The average cost per car per annum was therefore £1,403, leaving a surplus of £291. Taking Leeds as a sample about 75 per cent. of the rates was for lines and 25 for buildings, or £59 per vehicle for the former. After careful consideration the amount which clause 28 imposed on tramways was found to be £61 per car every year. To the surplus of £291, £120 should be added in rates paid in maintenance of roads for the general benefit of the towns. After explaining how he arrived at 80 per cent. as the earning capacity of the 'bus as compared with the car, Mr. Hamilton gave his reasons for quoting 10d. per car mile as the cost of running motor 'buses (exclusive of London) which would give a deficit of £176 per annum on each omnibus; this deficit would be increased by £38 if the cost of "extraordinary" traffic be imposed on them. From this the petrol tax of £31 should be deducted, leaving a net deficit of £183. Applying these figures to the 27 towns an annual loss of £914,085 would result from the substitution of the 'bus for the car. Moreover, "the annual cost per seat in the case of tramways was £23 as against £45 in the omnibus." As to railless traction, "the total cost of operation, under ordinary conditions, is at least 20 to 25 per cent. less per car mile than that of motor 'buses"; the vehicles were entirely free from smell, and did not easily skid. This form of traction could not, except under special circumstances, be substituted for tramways where traffic was heavy, but as a feeder to the latter it compared favourably with the motor 'bus. The higher costs of operation and general disadvantage in connection with petrol motor 'buses applied equally to petrol-electric, storage battery, steam, etc., vehicles. Petrol-driven tramcars on the other hand "may be found most useful where it is undesirable to erect overhead wires; but the costs of operation, which must be higher than where electricity is the traction force, are not yet established."

Alderman H. W. LITTLER (West Ham) opened the discussion, and he was followed by Mr. WORBY BEAUMONT, technical adviser to the Commissioner of Police, who thanked the Council for inviting him to be present. He declared that he had never said tramways were to be regarded as "back numbers." For many places they were the best means of transit, but he also knew of many other places where they were not the best means. To give figures relating to the running of 3,000 'buses in London would be misleading to people interested in the running of perhaps 30 'buses in any other place.

Other speakers included Alderman F. Smith (Liverpool), Mr. A. Baker (Birmingham), Mr. Heather (Leyton), Alderman Trumble, and Mr. C. J. Spencer. Thanks were accorded to Mr. Hamilton, who undertook to reply to the criticisms in writing.

ELECTION OF OFFICERS.

The annual business meeting of the Association was held yesterday morning, when the following officers were elected for the ensuing year:—President, Alderman H. Linsley, chairman of Salford Tramways Committee; vice-president, Mr. P. Fisher, general manager, Dundee Corporation Tramways; members of Council, Mr. A. L. C. Fell, chief officer, London County Council Tramways; Mr. J. B. Hamilton, general manager, Leeds City Tramways; Mr. G. W. Holford, general manager, Salford Corporation Tramways; and Mr. J. H. Rodgers, chairman, Newcastle-on-Tyne Tramways Committee; auditor, Mr. W. J. McCombe, general manager, Hull Corporation Tramways. Mr. C. J. Spencer, general manager, Bradford Corporation Tramways, was re-elected hon. secretary.

## MISCELLANEOUS NEWS AND NOTES.

**Increased Speed at West Ham.**—The Board of Trade have consented to an increase of the maximum speeds on the West Ham tramways.

**A Swansea Extension Scheme.**—The Light Railway Commissioners have approved of the project for the construction of a tramway up Town Hill by the Corporation for the development of their estate.

**Aberdare Railless Traction System.**—A trial run in connection with the Cedes-Stoll railless trolley installation at Aberdare, which is to be managed for the Urban Council by Mr. Abraham, was made on September 22. Mr. Rudman, representing Mr. S. Sellon, consulting engineer to the Council, was present.

**Dublin Employees Fined for Leaving Cars.**—At the police court on September 23 fifteen conductors and ten ex-motormen who took part in the futile strike were each fined 5s. for leaving tramcars unattended in the streets, in violation of a by-law of the Tramways Company. During the week a number of attacks have been made on police-escorted tramcars.

**Croydon Council Demand Traffic Legislation.**—On September 22 Croydon Corporation passed a resolution urging the Government speedily to legislate upon the lines of the recommendations of the Select Committee on Motor Traffic, owing to the dangerous and congested state of the streets, the serious accidents and loss of life, through the influx of motor 'buses. It was stated that five persons have been killed in Croydon this year by these vehicles, but none by tramcars.

**Lancashire Tramways Goods Carrying Scheme.**—Conferences on the matter of carrying goods have recently been held between the South Lancashire Tramways Company and the Manchester, Salford, and Liverpool Tramways Committees, and there is every probability that before long a scheme will be proposed by which it will be possible for goods to be loaded on specially-built tramcars in the vicinity of the Liverpool docks and conveyed during the night to Manchester and other parts of Lancashire. In order to provide for prompt distribution it is proposed to create depôts at different points, and from those depôts to distribute the traffic in adjoining areas by means of motor lorries.

## CONTRACTS AND ORDERS.

**Tudor Accumulator Company** have received an order for welding joints on the Newport (Mon.) tramways.

**Leyland Motors, Limited,** have received a contract to supply a motor tower wagon to Preston Tramways Committee, at £735.

**Prahran and Malvern (Victoria) Tramways Trust** have allotted a contract to Duncan and Fraser (Adelaide) for 10 car bodies, at £815 each.

**More P.A.Y.E. Cars for Leicester.**—The Corporation have given an order for 10 additional cars on the P.A.Y.E. system, and further purchases of cars of this type are in contemplation.

**Swindon Council** have placed contracts with the Davenport Engineering Company for a cooling tower, at £685, and with the Kennicott Water Softener Company for water softening plant, at £558.

**Belfast Tramways and Electricity Committee** have placed contracts with Callender's Cable Construction Company for the supply of cable, and with the British Thomson-Houston Company for the supply of switchgear.

**Melbourne City Council** have accepted the following tenders:—British General Electric Company, spare armature for 500 kw. motor-generator, £200; British Insulated and Helsby Cables, insulated copper cables, £1,361 5s.; and Dalgaty and Co., two Tangye's suction gas engines, £1,270.

**The Albion Motor Car Company, Limited,** have received an order from the South African Government Railways for twevle 32 h.p. Albion vehicles. This is the largest order ever placed by the South African Government, and is the result of the previous satisfaction they have had with the Albion vehicles which they purchased some years ago.

**E. Bennis and Co., Limited,** have received the following orders:—Mersey Railway Company power station, Birkenhead, two chain grate stokers; Keighley Electricity Works, two stokers and self-cleaning compressed air furnaces (repeat order); Bexley Heath Urban Council electricity and tramways department, two self-cleaning compressed air furnaces; Stirling electricity works, four stokers and self-cleaning compressed air furnaces.

**Glasgow Tramways Committee** have accepted tenders as subjoined:—B.I. and Helsby Cables, Limited, section pillar switches; J. Macmillan and Co., telephone switchboard for head office; P. R. Jackson and Co., Limited, Westinghouse commutators; Dewrance and Co. and Hopkinson and Co., valves for Pinkston power station; R. R. Todd, copper bonds; Lux Lamp Company, Limited, lamps. The Electricity Committee on Works have recommended for acceptance the following tenders:—British Westinghouse Company, Limited, two sets of 500 kw. size, £2,573; Siemens Bros. Dynamo Works, Limited, two sets of 250 kw. size, £1,787.

Digitized by Google

## PERSONAL.

**Mr. A. M. Little** has been retained as an expert adviser to the Mumbles Railway Company, in the matter of the electrification of the lines from Swansea to the Mumbles.

**Mr. F. Eggington,** principal assistant in charge of the West Ham tramways, has been granted a gratuity of £20 for extra services rendered since Mr. H. E. Blain resigned the managership.

**Mr. T. B. Moseley** has been presented with an oak bureau and bookcase by the staff and employees of Bradford tramways, on the occasion of his marriage. The tramways band made him a gift of a barometer.

**Sir Maurice Fitzmaurice,** late engineer to the London County Council, has been appointed by the Commonwealth Government to report upon the question of constructing naval bases for the Australian naval unit.

**Hobart Tramways Officials.**—It was mentioned at the August meeting of the Hobart (Tasmania) Council that the authority had had possession of the tramways for six weeks. Denial was given to a rumour that Mr. Parker, the manager, and Mr. C. B. Davies, the engineer, had had their salaries raised by the company just before the Corporation took over the undertaking. Alderman Amott stated that Mr. Davies was the last to receive an increase of salary, and that was over 18 months ago.

**Plymouth Management.**—Commenting on the annual report of Mr. C. R. Everson, the tramways manager, presented at a meeting of the Tramways Committee on September 21, the "Western Daily Mercury" says:—"The tramways relieved the rates by a penny, and spent out of revenue £4,300 on renewals and repairs. The liquidation of the loan capital is proceeding at a rapid rate. In the meantime, the success of the enterprise grows. Already the gross receipts for the current year are up by a thousand pounds. This is a tribute to good management, and a complete answer to the critics, who have never been able to conceal their hostility to municipal tramways."

**Mr. Leonard Johnston,** the new manager of the Southampton tramways, the local "Echo" is informed, effected a saving of £500 per annum by re-organising the work in the depôt whilst manager of the Blackburn tramways. At the time of his appointment the department was losing £5,000 per annum, but at the time of his resignation the balance-sheet showed a nett profit of £1,400. At Gloucester, during his first year of office, he saved £1,400 in operating expenses by re-organisation, and while the system was under his control the receipts increased by £2,000 per annum. The operating costs of 5.2 pence per car mile are among the lowest in the country. During the last two years of his managership at Gloucester, Mr. Johnston reduced the cost of current by £1,300. The consumption of .71 unit per car mile is claimed to be by far the lowest in the country. Mr. Johnston was for nine years engaged on the construction of tramway systems.

**Mr. William M. Murphy,** chairman of the Dublin United Tramways Company, is referred to by a Dublin correspondent of the "Manchester Guardian" as "formerly a Nationalist member for the city, and as owner of one of the Nationalist newspaper organisations. He is an intimate friend and follower of Mr. Timothy Healy. His commercial interests are unusually various and widespread. A railway contractor whose concern extends from South Clare to West Africa, a tramway constructor and director with interests in Lancashire and Kent as well as Dublin, hotel proprietor, newspaper proprietor, draper,' his career is a rather ironical comment on the theory that all the wealth and business talent of Ireland belong to the classic minority. Mr. Murphy is fighting the strike with all the cold determination that Lord Davenport displayed against the London dockers." Mr. Murphy has written to a London newspaper denying a statement that "he knew he carries his life in his hands," and adding that he passes every day through the streets without fear or apprehension of his personal safety, and without insult, or without having an angry word addressed to him. "It is not true to say that I have persuaded other employers to the course they have adopted. They are following my example, but not my lead, as I have no pretence to leadership. I am responsible only for my action in connection with the undertakings that I control."

**Mr. James Ross,** engineer, railway contractor and financier, whose death is announced at Montreal, went to the United States from Scotland in 1868. Along with Sir William Mackenzie he acquired the tramway systems of Birmingham (England), and formed the City of Birmingham Tramways Co., 1896. He was also interested in several electric traction and electricity supply undertakings in Canada and other countries.

## FINANCIAL REPORTS AND MEETINGS.

**Southport Tramway Deficit.**—The annual report of the Borough Treasurer shows that there was a deficit of £1,651 last year on the Corporation tramway undertaking. There was a net profit of £13,988 on gas, and of £1,362 on electricity.

**The British Electrical Federation.**—The traffic statement for the week ended September 19, 1913, shows that the receipts from tramways and railways amounted to £41,188, as compared with £39,586 in the corresponding week last year, and from omnibuses £12,805, as compared with £826, making a total of £53,993, as compared with £40,412. The tramway and railway route mileage was 429.82, as compared with 431.52. The Federation now have 514 omnibuses, an increase of 422 within the year. Upon such of the services as were working, both last year and this year, the receipts show an increase of £2,127 upon the week.

**Melbourne Tramway and Omnibus Company.**—The directors report that the balance shown after paying 3s. per share in dividends and bonuses for the year, and including £95,991 brought forward from last year, is £202,754. From this they propose to pay a final bonus of 1s. per share, £48,000; to carry to reserve for return of capital, making it £480,000, £105,741, leaving to carry forward £49,013. The traffic receipts for the year to June 30 improved by £34,181, and 4,284,810 more passengers have been carried than during the previous year. The negotiations for the sale of the company's business to the Government that were in progress at the time of the last report ultimately lapsed. For the quarter ending September 30 the directors announce a dividend of 6d. per share and also a bonus of 6d. per share.

## COPPER AND ALUMINIUM MARKET.

September 26, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton:—

# WEEKLY LIST OF TENDERS INVITED.

### CARDIFF CITY TRAMWAYS.

The Cardiff Corporation invite tenders for the supply of Passenger Tickets and Ticket Punches over a period of years commencing as and from January 1 next, 1914. Full particulars can be obtained on application to Mr. Arthur Ellis, Manager, Central Offices, The Hayes, Cardiff. Tenders to be endorsed "Tenders for Tickets and Punches for Tramways," and to be delivered at my Office not later than the first post on Friday, October 17, 1913.

J. L. WHEATLEY,
Town Clerk.

City Hall, Cardiff.

### COUNTY BOROUGH OF CROYDON.

SUPPLY OF TWO PETROL MOTOR FIRE ENGINES AND ONE MOTOR WAGON.

Notice is hereby given that the Council are prepared to receive tenders for the supply of Two Petrol Motor Fire Engines and One Motor Wagon for their Fire Brigade.

Forms of tender and conditions may be obtained on application at the Borough Engineer's Office, Town Hall, Croydon. Tenders will only be received subject to Draft Contract and conditions deposited at my office, which may be inspected during office hours.

Tenders, on the prescribed form, must be sent to me by 12 noon on Monday, the 13th day of October, 1913, endorsed "Tender for Motor Fire Engines, etc."

The Council will not be bound to accept the lowest or any tender.

JOHN M. NEWNHAM,
Town Clerk.

Town Hall, Croydon,
September 26, 1913.

### CITY OF MANCHESTER.

The Electricity Committee of the Manchester Corporation invite tenders for the supply, delivery, and erection of the following:—

(*a*) One 1,800-2,000 kw. Motor Converter or Rotary Converter and Static Transformers.
(*b*) High Tension Switchboard.
(*c*) Static Transformers.

Specifications and forms of tender may be obtained on application to Mr. F. E. Hughes, Secretary, Electricity Department, Town Hall, Manchester, on payment of a fee of one guinea for each specification, which amount will be refunded on receipt of a *bonâ-fide* tender.

Further particulars and information can be obtained from Mr. S. L. Pearce, Chief Electrical Engineer, Dickinson Street, Manchester.

Tenders, duly endorsed, and addressed to the Chairman of the Electricity Committee, must be delivered at the Town Hall not later than 10 a.m. on Thursday, October 16, 1913.

The Corporation do not bind themselves to accept the lowest or any tender.

THOMAS HUDSON,
Town Clerk.

Town Hall, Manchester,
September 29, 1913.

### CITY OF BRADFORD.

TRAMWAYS DEPARTMENT.

TENDERS FOR GENERAL STORES.

The Bradford Corporation are prepared to receive tenders for the supply of Miscellaneous Stores required by the Tramways Department during the year ending December 31, 1914, as follows, viz.:—

Schedule No.

1 Bolts, Nuts, Screws, Washers, Nails, Cotter Pins, Rivets, Brass Rod, Lead, Hack Saw Blades, Twist Drills, and Miscellaneous Ironmongery.
2 Files.
3 Lamp Fittings.
4 Insulating Material, Tapes, and Calico.
5 Sand Bags.
6 Copper Fuse Wire.
7 Iron, Malleable, and Steel Castings.
8 Phosphor Bronze, Gun Metal, and Brass Castings, Copper Controller Finger Contacts, and Drivers' Alarm Bells.
9 Insulated Bolts and Strains.
10 Bar Iron and Steel, and Galvanised Steel Sheets.
11 Oils and Grease.
12 Paints, Dry Colours, and Shellac.
13 Spirits and Acids.
14 Drysaltery and Disinfecting Fluid.
15 Paint Brushes and Cleaning Brushes.
16 Waste, Sponges, Washleathers, Cleaning Cloths, and Soap.
17 Transfers and Gold Leaf.
18 Glass.
19 Steel Pinions.
20 Delivery Hose, Indiarubber, Vulcanite Fibre, and Insulating Paper.
21 Timber.

Schedule and conditions of tender may be had on application at the Tramway Offices, 7, Hall Ings, Bradford, on payment of the sum of one guinea, which amount will be refunded on receipt of a *bonâ-fide* tender. (Cheques to be made payable to the order of the Bradford Corporation.) The contracts will be let subject to the Fair Contracts Clauses of the Corporation.

Samples can be inspected at the aforesaid Tramway Offices. Tenders endorsed "Tender for Stores," to be sent to me not later than Saturday, the 18th instant. The lowest or any tender will not necessarily be accepted.

FREDERICK STEVENS,
Town Clerk.

Town Hall, Bradford,
October 1, 1913.

### COUNTY OF LONDON.

The London County Council invites tenders for the supply and delivery of 200 Driving Wheel Centres for Electric Cars. Persons desiring to submit tenders may obtain the specifications, drawing, form of tender, etc., on application to the Chief Officer, London County Council Tramways, 62, Finsbury Pavement, E.C. Tenders must be upon the official forms and the instructions therein must be strictly complied with. Tenders must be delivered in a sealed envelope addressed to the Clerk of the Council, Spring Gardens, S.W., and marked "Tender for Driving Wheel Centres, L.C.C. Tramways." No tender received after 11 a.m. on Tuesday, October 14, 1913, will be considered. The Council does not bind itself to accept the lowest or any tender.

JAMES BIRD,
Deputy Clerk of the London County Council.

County Hall, Spring Gardens, S.W.,
September 29, 1913.

## THE CARRIAGE OF GOODS ON TRAMWAYS.

The subject of the carrying of goods on tramways is one which has been intermittently and ineffectively discussed for years. However desirable in theory, practical difficulties always seem to stand in the way. In no part of England probably is there a better field for such an enterprise than there is in South Lancashire, and it is there that the subject is now being taken up afresh. It has been discussed between the Tramway Committees of Liverpool, Manchester, and Salford and representatives of the South Lancashire Tramway Company. The idea is to load specially constructed cars with goods at Liverpool docks and to transport the loads by the tramways to their destinations in various towns inland from Liverpool. The local circumstances are specially favourable. A large proportion of the goods would consist of bales of cotton, which are readily handled by lifting tackle, and which are compact and of considerable weight in proportion to their bulk. Similar considerations apply to the cotton cloth which, when manufactured, might be sent to Liverpool also by tramway for export. Then the interurban tramway system in South Lancashire is exceptionally complete, and only a small proportion of additional tramway lines would have to be constructed in order to give full facilities. The work would, of course, be carried on during the night, and the total distances in many cases are so moderate that the transportation, including time for delivery, would be speedier than by railway. An incentive to this use of the tramways by night when no passenger cars are running may be found in the recent increases in railway goods rates. A very powerful incentive to the local authorities responsible for road maintenance both in the boroughs and in the county is the enormous increase in the number of heavy motor lorries engaged in the transport of cotton by road. These vehicles make havoc on the highways, and pay nothing towards the upkeep. The local authorities are now involved in very serious expense for road maintenance, and the cost is ever increasing. If the bulk of this traffic was transferred to the tramways, the charges for the transport would cover the cost of maintaining the permanent way, or at all events part of it, the remainder being borne by the passenger revenue. To meet the cases where the goods could not be taken direct into or away from the mills by the tramways, local depôts would be established which would act as distributing and collecting centres. The lorry work would thus be confined to very short distance hauls, and the main roads would be relieved of much wear and tear. The only people who would stand to lose would be carrier firms, who would be confined to localised work and to work further afield. Their position at present, however, is one of exceptional privilege, because they are carrying on what is really the equivalent of a railway goods business without having to pay anything for land or permanent way and free from charges for maintenance and rates. Everything except the vehicles and their sheds is provided for them by the ratepayers. It is quite obvious that whether this tramway goods traffic scheme materialises or not, justice demands that some impost should be levied from the motor lorry firms, just as should be the case with motor omnibuses, so that the vehicles which for trade purposes tear up the roads should contribute to the maintenance in proportion to the wear that they cause. It is also clear that if tramway goods traffic is to be developed in South Lancashire, the local authorities and the tramway company concerned will have to develop something in the nature of a joint committee or board for the purpose of financing and carrying on the undertaking. That, again, might need further powers from Parliament. Those who are moving in the matter may, however, be trusted to take these and other circumstances into full consideration.

## THE REMEDY FOR THE STOPPING PLACE TROUBLE.

Whether it be due or not to the suggestion made at the sittings of the Select Committee on London Motor Traffic that the tramway authorities and the Omnibus Combine should come to an agreement to observe separate stopping places, the action of the omnibus management in coming to an arrangement with the West Ham Tramways Committee is a step in the right direction. Moreover, it should serve to counteract the plea that the statistics as to casualties demand drastic legislation. Based upon this agreement the Commissioner of Police is about to issue regulations that will remove in West Ham a source of danger to the public, and one that has been responsible for deaths and injuries in London generally. It is noteworthy that Mr. H. E. Blain, the late manager at West Ham, and now associated with the London General Omnibus Company, took a more determined stand than any other tramway manager in prosecuting omnibus drivers for this practice when it was the cause of danger to the public and obstruction to the cars. The task in reality is a police duty, but only in Croydon do they appear to have shown due appreciation of their responsibility. A few prosecutions have been instituted by the London County Council tramway department, but passengers on this system show so little inclination to support conductors in efforts to secure their safety that the employees are to be excused if they have relapsed into indifference. Now that West Ham has shown that it is possible to secure harmonious working, it is to be hoped that other authorities will effect similar arrangements. In many towns through-

Digitized by Google

out the country complaint is frequently made of drivers of motor-cars endangering people when entering or leaving tramcars, and at some busy places police have been stationed in order to abate the danger. Only this week a Newcastle paper has urged the necessity for an extension of this safeguard, while the Glasgow Corporation last year obtained an Order under which motor and other vehicles are to observe certain regulations when passing tramcars at stopping places. A few years ago a Bradford case was taken to the High Court, with the result that the Local Government Board amended the regulation that permitted motor cars to pass only on the near side. What has been done at Glasgow may well engage the attention of the authorities in other large centres. The Glasgow by-laws are as follow :—

Every driver of a vehicle shall observe the proper rules for driving, provided that when passing a tramway car or any other vehicle which runs on fixed rails, and which is proceeding in the same direction, he shall pass on the left or near side of such car or other vehicle, except in cases of sufficient reason for deviation.

When a tramway car is standing at a tramway stopping-place, and such stopping-place is indicated by a notice on the side of the street, every driver of a vehicle who intends to pass on the left or near side of such car shall draw up immediately before arriving at such stopping-place until the roadway is clear of passengers entering or leaving a car.

On September 19th, the Magistrates' Committee of the Corporation conferred with representatives of the Scottish Automobile Club with reference to the two regulations, and the fact that the automobilists agreed to the by-laws, subject to the same receiving the approval of the Corporation and confirmation by the Sheriff, shows that a real need exists for the enactmen..

## P.A.Y.E. CAR DEBATE AT LEICESTER.

At a meeting of Leicester Council on September 30. Alderman Flint moved the adoption of the Tramways Committee's report recommending the purchase of ten more P.A.Y.E. cars. Apart altogether from the question of pay-as-you-enter cars, they must have some more cars, and the probability was that in a short time they would have to ask for another ten or twenty. With regard to the P.A.Y.E. cars, they considered these cars had met all reasonable objections. The agitation against them had been got up by a few people. In Aberdeen and Gateshead, where the system had been in operation, there had never been a word of complaint. Many people had condemned these cars who had never seen them, and many people did not know the way in which objections had been met. The Corporation should consider honestly and fairly the advantages, and put them by the side of any disadvantage. Their duty was to promote the convenience and comfort of their tramway passengers, and they were not going to set their faces against any suggestion towards that end. There was no delay on the cars. It was stated that they did not make the journey so quickly; he said without hesitation that the journey was made in as short a time as ever before. They were not going to give the system up at the first breath of criticism. If at the end of a period of trial they had fixed in their minds the system was not found better than the other then they could give it up. Some people objected to have to pay before they entered, but, considering the advantages of the system, he did not think that amounted to much. They were now proposing to run a through service, so that people would be able to ride from the Narborough Road terminus to the Midland Station without getting off the car.

Alderman Banton seconded, and Councillor Hawkes proposed that the recommendation be referred back for further consideration. He had moved in the committee that considering the prejudice that existed the cars on the Narborough Road route be transferred to another, to see if the same prejudice would be apparent there, and he was sorry to say that he only received the support of one member.

Councillor Hincks said there was a strong outburst of feeling against the cars after the first day or two's experience. If they could have seen one or two members of the Council trying to get up that narrow staircase! (Laughter.) A man of ordinary stature could get up, but anybody of any girth got wedged. It was a positive danger for a woman with a baby to get up these stairs, and a greater danger for her to get down them. Alderman Flint had given certain concessions, thereby proving the efficacy of the agitation against the cars. Every concession he had made had been against his own principle, and had been bringing the pay-as-you-enter cars nearer the old-fashioned cars.

Alderman Chaplin said he had not heard the remarks referred to, though he had used the cars a good deal. His opinion was that it could not be said to be a quicker method, it was not a more convenient method, and he did not think it was better in any sense except from the point of view of safety. From this point they were an improvement, and if they only saved one limb in 20 years he thought they ought to have them.

Councillor Lovell said these cars cost more than the others—he believed £60 more, besides the £20 royalty. The committee must remember that the cars were for the people, not the people for the cars.

After further speeches in opposition, Councillor Hand said he was compelled to use the cars frequently, and he had listened to all the objections raised against the cars. First of all there were objections, but for the last month or two there had been practically none.

Alderman Banton said the manager's reports showed that the service had been increased from five minutes to 4½ minutes. Now the cars would be run round the corner, and four to five minutes would be saved. In regard to wet days—it took no longer to load up a car. He believed in the queue, and a number of people got in quicker now than they did before inspectors had been put on special duty. Accidents last year amounted to 449, and these would be in large measure decreased. He appealed to them to consider the conductor.

Alderman Flint, in reply, said that there was not a 'bus in or out of London where the steps were not narrower and steeper than in the new cars. Another reason the fares had gone down was the reduced fares to children. More people had been actually carried than before.

The amendment was carried by 24 votes to 20. Another count being taken, the amendment for the report to be referred back was carried by 25 votes to 22.

## GLASGOW TO CONSIDER UNDERGROUND RAILWAYS.

The City Council on September 26 by 19 votes to 16 adopted the following motion by Councillor Shedden :—"That as a means of solving the question of congestion on the streets, and of giving facilities towards the expansion of the city, the Corporation appoint a special committee to consider and report as to the feasibility of establishing a system of tube electric railways from east to west (say Shettleston to Clydebank), and from north to south (say Bishopbriggs to Rouken Glen)."

Mr. Hamilton seconded. Parallel routes as a tramway reform would not relieve congestion very much. The three remedies open to them to relieve congestion on the busy streets were aerial railway, underground tube, and motor 'buses. The Corporation, he thought, should take time by the forelock and have a committee sitting on the question.

Mr. Hugh Alexander said the proposal was altogether impracticable. They were asked to consider a scheme which, he believed, would cost about £10,000,000.

## ABERDARE TRAMWAYS AND RAILLESS TRACTION.

The Board of Trade inspection took place yesterday of the new installation of tramways and railless traction on the Cedes-Stoll system belonging to Aberdare Urban District Council. Trial runs had previously been made, and everything was found to work very satisfactorily. The undertaking, for which Messrs. Stephen Sellon and Partners have been the consulting engineers, was authorised by Act of Parliament in 1911, and the route lengths comprise 2¾ miles of tramways and 3½ miles of roads equipped for the trackless trolley system of electric cars. The tramways are constructed as a single line with passing places, and the overhead equipment is mainly on the span wire method. The four railless routes, which diverge from the tramway at four different points, are equipped on the Cedes-Stoll system with bracket arm construction. Single-deck tramcars, each with seating accommodation for 28 passengers, are used, while the railless cars each seat 27 passengers. The depôt is situated at Gladlys, in close proximity to the Council's generating station. In the latter, additional plant has been installed for the purpose of meeting the traction load.

## NEW AND PROSPECTIVE WORK.

Birmingham.—The City Council on October 1 decided to promote a Bill for the construction of a number of tramway extensions.

Brighton.—The track in Beaconsfield Road is to be renewed at an estimated cost of £4,500 after the completion of the renewal of the London Road track.

Cardiff.—It is recommended by the Tramways Committee that the line in Ninian Road be doubled immediately at an estimated cost of £6,000.

China.—Canton has an extensive tramways scheme under consideration. No progress is being made with the scheme for the construction of tramways in Pekin.

Leeds.—A Local Government Board inquiry was held on September 26 into an application by the City Council to borrow £168,500 for new plant to develop the electricity undertaking.

Leicester.—The Corporation on September 30 adopted a proposal by the Tramways Committee for the immediate construction

Digitized by Google

of a line from the West Bridge along St. Augustine Street and King Richard's Road to Fosse Road. The total estimated cost of the work is £30,000; £19,000 of this is for road widenings and the other £11,000 for the tramways. Alderman Flint stated that if the tramways were constructed the Fosse Road service would be operated at considerably less cost than it was at present. The saving would be almost enough to pay six per cent. on the total outlay.

Messina.—A concession has been granted to the Sicilian Tramways Company for the construction and working of an electric tramway system. The total length of the entire system will be 48 miles.

Newcastle.—Longbenton Council have decided to assist Newcastle Corporation in obtaining powers to extend the tramways from the terminus at Heaton Cemetery *viâ* Longbenton to Forest Hall and link up with the tramway system at that point, with the aid of motor 'buses to Benton Square on the east side, and to West Moor, Camperdown, and Burradon on the north side.

Nottingham.—It is stated that in the near future the Tramways Committee will consider the question of extending the system from Derby Road to Wollaton Park gates.

Preston.—The Tramways Committee recommend that powers be obtained for the construction of three new lines, which will link up portions of the existing system. A line will be constructed from Moor Park Avenue, on the Garstang Road, to Brook Street, near the Cattle Market, and join the present line at Ashton-on-Ribble. The second extension will connect the Fulwood line, while the existing dead ends in Corporation Street will be linked up, making a through line to the railway station. Another new line will be laid along London Road to Walton Bridge, a distance of a mile.

Russia.—The Council of Ministers has approved the proposal by the Minister of Finance to grant a concession to M. S. U. Lampitsky to construct and exploit an electric tramway from the town of Warsaw to the village of Lounjanky, in the district of Warsaw.—The Town Council of Karkoff has decided to buy up the horse tramway system in the town.—The town of Karbin proposes to construct a three-line tramway about 12 versts (8 miles) long.—The Minister of Ways of Communication has approved the proposed issue of a loan by the town of Samara for the construction of an electric tramway and the extension of the electric lighting system.

Wemyss.—The Tramways Company propose to double the line from Leven High Street to Muiredge.

West Hartlepool.—The Tramways Committee have been asked to consider the question of extending the tramways to Middlesbrough *viâ* a proposed new road.

York.—Railless trolley car installations are recommended by the Tramways Committee on the following routes:—Nessgate to Layerthorpe and Howorth, Nessgate to Huntington Road, *viâ* Goodramgate and Monkgate, and from the station down Bootham to Clifton. Tramway extensions are advised in Corporation Street and Hall Road, and from Clifton Scope to Leeman Road, *viâ* a bridge to be constructed across the Ouse.

## MISCELLANEOUS NEWS AND NOTES.

**New Cars for Wigan.**—The Council have decided to apply for sanction to borrowing £5,700 for the purchase of six new tramcars.

**Railless Cars Scheme to Serve a Kent Colliery.**—It is stated that the collieries which will shortly be in operation near Dover are considering the question of installing a railless car service to that town.

**Wrexham Tramways Company to Use Motor Omnibuses.**—In order to meet the needs of the district between Chester and Mold the Wrexham and District Electric Tramways Company have decided to run a motor omnibus service.

**Cambridge Street Tramways Company.**—Cambridge Corporation on September 25 agreed to present a petition for the winding up of this horse traction undertaking, the Town Clerk having failed to secure payment of the money due for road repairs.

**British Omnibuses for Russia.**—It is reported from Odessa that an English company is arranging to start a number of public motor 'bus services in the Crimea, between Simferopol and the following places: Eupatoria, Alupka, and Theodoria.

**A New Lanarkshire Route.**—Major Pringle, of the Board of Trade, on September 24 inspected an extension of the Lanarkshire Tramway Company's system from New Stevenson Cross to Bellshill, and the route was subsequently opened for traffic.

**Omnibuses for Edinburgh.**—On September 30 a conference was held between the Tramways Committee and the Tramways Company for the consideration of routes for the experimental running of motor omnibuses by the company, the vehicles to be purchased by the City Council.

**A Tribute to Wolverhampton.**—Speaking at a meeting of the newly-formed district council of tramwaymen and carters of Birmingham and South Staffordshire, Mr. Vaughan, a delegate, stated that if every class of labour had met with the same courtesy from their employers as had the local tramwaymen, there would have been fewer disputes.

**Omnibuses for the Yorkshire Tramways Company.**—Yorkshire (Woollen District) Tramway Company have ordered three motor omnibuses, to be run experimentally from Dewsbury Market Place to Dewsbury Moor, from Dewsbury Market Place to Shawcross, and between Shepley Bridge, Bradley, and Brighouse. The new services are expected to begin in November.

**Car Builders' Wages in Australia.**—Owing to the Wages Boards having made the wages of the car builders in Victoria higher than in any other State a member of the Prahran Council has reported that he fears the orders for new bogie cars to be given out by the Prahran and Malvern Tramways Trust will go out of the State as all other such work has done.

**"Southern" Motor Omnibuses.**—Since the amalgamation of the South Metropolitan Tramways Company with the London traffic combine the company, whose traways serve the district between Croydon, Crystal Palace, Sutton, and Tooting, have placed a number of motor omnibuses in service between the Crystal Palace and the Albany Street Barracks in north-west London.

**Underground Railways for Sydney.**—The Minister for Public Works, New South Wales, recently stated that he will seek authority for the immediate construction of underground railways at Sydney. "Before these underground railways can be constructed," says the Minister, "the traffic will have reached such dimensions that no surface tramway in the world could cope with it."

**Electric Autobuses for Berlin.**—It is announced that two lines of electric autobuses are about to be established in Berlin. The 'buses will, like the electric cabs, carry their power in accumulators. The persistence of the electric cab proves that compensation has been found for the great weight of the accumulators in the absence of smell and noise and other inconveniences of fuel-burning autovehicles.

**Excess Passengers at Birmingham.**—Interviewed on the subject of complaints regarding "strap-hanging" in the tramcars, Councillor Harrison Barrow, chairman of the Tramways Committee, has stated that the conductors were only authorised to allow six such passengers. The conductor had power to admit the standing passengers at all hours of the day, but personally he thought a good deal of difficulty would be saved if these additional fares were limited to an hour or so in the morning and a couple of hours in the evening. The congestion would be relieved, the committee hoped, when the eight additional cars ordered were on the lines.

**Light Railway Orders.**—The Board of Trade have recently confirmed the undermentioned Orders made by the Light Railway Commissioners:—Birmingham Corporation (Quinton) Light Railway Order, 1913, authorising the construction of a light railway in the city and county of Birmingham and in the parish of Warley in the urban district of Oldbury, in the county of Worcester, in extension of the light railway authorised by the Birmingham Corporation Light Railway Order, 1912; Southwold Harbour Light Railway Order, 1913, authorising the construction of a light railway in the Borough of Southwold, in the county of Suffolk, connecting Southwold Harbour with the Southwold Railway.

**Omnibus Company's Request to East Ham Tramways.**—In reporting to East Ham Council on a request received from the London General Omnibus Company for the Council to remove their tramway standards in a portion of Forest Drive in view of the possible danger to passengers on the 'buses, Mr. C. Ullman, the tramways manager and engineer, pointed out that considerable expense would have to be incurred in the near future in the Manor Way, where subsidences in the track and roadway have occurred since the inauguration of the service of 'buses. The annual report shows a deficiency of £1,217 on the undertaking during the year ended March 31 last, being an increase of £729. The income was £57,960, and the working expenses £45,808.

**Trail Cars and Motor Omnibus Powers for Birmingham.**—The Bill to be promoted next Session by the Corporation will include powers to provide and run motor omnibuses and coupled and trail tramcars within the city.—Councillor Harrison Barrow, in moving the adoption of the clause at a meeting of Council on October 1, said the committee had been in communication with the omnibus company in reference to the purchase of all their interests in the city, and they had practically come to an agreement with regard to price. The company required to have facilities for running omnibuses from outside districts, such as Halesowen, Shirley, and Coventry, and they had promised they would not in any way interfere with the local services. He hoped to be able to report shortly that they had come to a settlement with the company.

**The Brill "Radiax" Truck.**—The J. G. Brill Company (110, Cannon Street, E.C.) have issued an admirably illustrated booklet on their radial truck which has met with much success on many tramway lines in the United States, on the Continent, in South Africa, Tasmania, Japan, and China. Patent rights have been granted or are being applied for in all countries. The trucks have a solid forged frame, and the patented device consists of pairs of swing links of special forms mounted on spiral springs, which rest in ears cast on each side of the journal boxes. The upper end of the links is of hemispherical form and rests in a socket casting at the top of the spring. The link passes through the spring, and at its lower end has two pins or trunnions, which engage in grooves formed in a casting enclosing the lower part of the frame. On a straight track, with the link upright, the frame rests on both pins. Whenever from any cause the link is inclined from the perpendicular, one or other of the pins leaves its groove, thereby producing an inclination between the two supporting points of the link, equal to half the distance between the pins, and an immediate and powerful tendency is set up to return to the normal position. The links are of exceptional length and permit of a considerable radial movement. The motors are fixed and the brake gear is arranged in the most advantageous manner. The truck has been designed to interchange, after slight modifications, with any type of non-radial body.

Digitized by Google

**The Labour Troubles at Dublin.**—In order to relieve the police, military guards have been placed at the tramway power-house and at twelve of the company's depôts since September 25. On September 26 application was made for eviction orders against a number of late employees of the company who are occupants of the company's cottages, but on the application of a solicitor the hearing was adjourned for two weeks pending the result of the Board of Trade inquiry by Sir George Askwith, Sir T. R. Ellis, and Mr. Clynes, M.P., into the circumstances of the general labour troubles now experienced in the city. Mr. W. M. Murphy, chairman of the tramways company, was one of the employers who gave evidence at the inquiry on October 2 and 3. He stated that the tramway strike occurred in the Horse Show week, and that within one hour afterwards an ample service of cars was being run.

**The Development Commissioners and Rural Transport.**—Three applications were received during the year 1912-13 by the Development Commissioners for grants towards rural transport schemes. One related to a service of motor cars and the others to light railways. No grants are to be considered until after the Board have received a report from an engineer familiar with commercial motor transport on the relative merits of light railways and motor transport. The Commissioners state that they have reason to think that some important schemes are likely to be brought forward shortly. So far no grants have been made to transport schemes during the three years the Commission has been in existence. The reason for the failure of the Act in this respect as well as in regard to afforestation, land drainage, and reclamation is attributed in the report to the fact that no advances can be made to individuals or to companies trading for profit. The Commissioners suggest that this difficulty might to some extent be overcome by the formation of national associations to receive and administer advances. Such an association, we may add, has been formed for the counties of Aberdeen, Banff, and Kincardine for the purpose of constructing light railways.

**A Portsmouth Extension.**—The third of the tramway extensions recently constructed at Portsmouth has been completed, the trial car having been driven in turn by Councillors Main and Stobil, who received a tribute from the Mayor (Councillor Corke), the chairman of the Tramways Committee, for their efforts to bring the scheme to fruition. The new line connects the system between the end of Goldsmith Avenue and the junction of Eastney Road. The cost has been £5,887, the total outlay on the three extensions being £25,069. The Mayor congratulated the manager and engineer and their respective staffs upon the excellent manner in which the work in connection with the extension had been carried out. Mr. V. G. Lironi, electrical and permanent way engineer, and Mr. W. R. Spaven, general manager, returned thanks on behalf of their staffs, both agreeing that the extensions which had lately been inaugurated would prove an acquisition to the general system. Councillor J. Timpson (vice-chairman), who has been associated closely with the work connected with the extension, proposed the health of the Mayor, thanking him, on behalf of the Council and Committee, for the time, attention, and trouble he had given. In response the Mayor remarked that the Committee were quietly pursuing a progressive policy, and would not be satisfied until they had got the system into a perfectly sound running condition, whether it applied to the cheapening of fares or improving the conditions of their employees.

## PERSONAL.

**Mr. H. A. Goodyer,** of Walsall, has been appointed chief clerk in Coventry Corporation tramways department.

**Mr. W. H. Milnes,** assistant engineer, Coventry Corporation tramways, has had his salary increased from £180 to £200 per annum.

**Dr. Hans Goldschmidt,** whose name is well known in connection with the patent alumino thermic process, has been granted the title of Professor.

**Mr. J. E. Waller** has been paid £52 10s. for professional services rendered in connection with the tramways provisions of the Coventry Corporation Act, 1913.

**Mr. Justus Eck,** engineer-in-chief and general manager of the Union Electric Company, left England by the "Majestic" on October 1 for a tour in the United States.

**Mr. H. J. Somerset** has retired from the position of manager of the Perth (W.A.) tramways, which have been purchased by the Government, and is returning to England.

**Mr. G. Cardwell,** manager of the Devonport and District Tramways Company, has been presented with a silver tea and coffee urn by the employees on the occasion of his marriage.

**Mr. G. A. Burls,** formerly of J. I. Thornycroft, Limited, motor vehicle manufacturers, has prepared a report for the Development Commissioners in a specific case on the relative merits, particularly from a financial point of view, of light railways and motor transport.

**Mr. J. Willey,** late rolling stock foreman, Isle of Thanet Electric Tramways Company, has been presented with an oak writing desk and an oak umbrella stand on the occasion of his departure to enter a local business. In the absence of Mr. J. A. Forde, the manager, the presentation was made by Mr. A. J. Bousfield.

**Mr. J. S. D. Moffet** has been presented with a canteen of cutlery by the chief officers of Rochdale Council upon his departure to take up the duties of general manager of the West Ham tramways. The gift was handed over by Mr. T. R. Bail, the gasworks manager, and speeches were also made by Mr. W. H. Hickson (Town Clerk), Mr. S. Platt, and Mr. G. Webster, the new manager of the tramways.

**Mr. C. W. G. Little,** chief electrical engineer of the British Electrical Federation, Limited, on behalf of the Swansea Improvements and Tramways Company, who are lessees of the Mumbles Railway and Pier undertaking, is advising the company on the subject of the proposed electrification of the railway from Swansea to the Mumbles, which was described and illustrated in our issue of June 13, 1912. In our last issue Mr. Little's initials were incorrectly given.

**Mr. Peter Fisher,** manager of the Dundee tramways, and Mr. Robertson, manager of the Greenock Council's electricity department, have been consulted by the Stirling Corporation with regard to Messrs. Baifour, Beattie and Company's offer to carry out the electrification of the tramways and to purchase the power station. Mr. Fisher on September 28 was congratulated by Dundee Tramways Committee on his election as vice-president of the Municipal Tramways Association, which will meet at Dundee in 1915. Convener G. A. Johnston observed that the appointment was a compliment to Dundee as well as to Mr. Fisher, who was recognised as being a thoroughly up-to-date tramway manager.

**Presentations to Mr. H. E. Blain.**—At a largely attended gathering of employees of the West Ham Corporation tramways and their friends, Mr. H. E. Blain, who vacated the position of tramways manager recently, received further presentations on behalf of the staff. The gifts of the Employees' Social and Athletic Club were a handsome French gilt drawing-room clock with two painted china ornaments, whilst presents from the inspectors' staff were a crocodile cigar case and a gold-mounted amber cigar holder. Mr. Blain has also been the recipient of a very artistic illuminated and framed testimonial under the seal of the West Ham Corporation over the signatures of the Mayor and Town Clerk, testifying the appreciation of the Council of his services during his ten years in West Ham.

**Mr. Leonard Johnston** has been congratulated by Gloucester Tramways Committee upon obtaining the appointment of manager of the Southampton Corporation tramways, where he will begin duty in the third week of October. Alderman Talbot, chairman of the committee, mentioned that a deputation from Southampton visited the city in connection with the appointment of Mr. Johnston. Alderman Dunsford, the chairman of the Southampton tramways, went to the depôt and looked over everything, and was very pleased with what he saw. He also went over the track and examined it very minutely, and afterwards said that Gloucester had a system of which it ought to be proud. That gentleman had had very great experience of tramway work, and on his return he wrote a letter in which he said that it was largely due to what the deputation had seen at Gloucester and of Mr. Johnston's work that they had no hesitation in selecting him.

**The Late Mr. Anthony N. Brady,** the tramway, gas, and electric power promoter, who died suddenly in the Carlton Hotel, London, on July 22, left a will, which, after making ample provision for the support of the widow, divides the balance of the estate, which is estimated at £14,000,000, among five children and one grandchild.

**Mr. Frame Thomson,** who on September 28 was found dead in his house at Highgate, was to have sailed yesterday (Friday) for South America. Mr. Thomson was a director of the following companies:—Alliance Investment, Anglo-Argentine Tramways (deputy-chairman), Cordoba Light, Power and Traction (chairman), La Plata Electric Tramways, and United Electric Tramways of Monte Video (deputy-chairman). At the inquest it was stated that the deceased was extracting a cartridge from a gun he kept for shooting pigeons when the charge entered his body. The jury found that the occurrence was accidental.

## CONTRACTS AND ORDERS.

**Bexley Council** have accepted the tender of Siemens Bros., Limited, for a motor-generator, at £320.

**The Dunlop Rubber Company** have received a contract for the supply of solid tyres to the Sheffield Corporation's motor omnibuses.

**Walthamstow Council** have accepted the tender of W. T. Henley's Telegraph Works Company for the supply of 550 yards of three-core l.t. cable, at £200 10s.

**Babcock and Wilcox, Limited,** have received a contract for the supply of a boiler, superheater, and mechanical stoker at Southampton electricity works, at £1,661.

**Derby Council** have been recommended to make a contract with the Bell Punch and Advertising Company for the supply of tramway tickets at 2½d. instead of 1⅞d. per thousand.

**Westinghouse Machine Company** have, according to American engineering journals, received a contract for the supply of three turbo-generating units, each of 30,000 kw. capacity, for the New York subway extension.

**Mr. John Taylor,** of Strand Street, Liverpool, has recently received the following orders for his patent tubular sanding devices:—County Borough of Rotherham, for 100; the Brush Electrical Engineering Company, Limited, for 20, for the Salford Corporation cars.

**Wimbledon Council** have accepted the following tenders:—British Thomson-Houston Company, 1,500 kw. turbo-alternator, condensing plant, pipework and auxiliaries, £8,711; Herbert Morris, Limited, overhead travelling crane, £258; British Electric Transformer Company, one 75 kw. and one 50 kw. electric transformer, £123.

Digitized by Google

# FINANCIAL REPORTS AND MEETINGS.

**Babcock and Wilcox, Limited.**—The directors announce an interim dividend of 7 per cent. on the ordinary shares for the half-year ended June last.

**Lisbon Electric Tramways.**—An interim dividend of 3 per cent., free of income-tax, on account of earnings of current year has been declared, payable on November 7 on ordinary shares.

**The British Electrical Federation.**—The traffic statement for the week ended September 26, 1913, shows that the receipts from tramways and railways amounted to £42,231, as compared with £38,733 in the corresponding week last year, and from omnibuses £1,683, as compared with £1,282, making a total of £55,914, as compared with £40,015. The tramway and railway route mileage was 429.82, as compared with 431.52. The Federation now have 514 omnibuses, an increase of 422 within the year. Upon such of the services as were working, both last year and this year, the receipts show an increase of £3,914 upon the week.

**Shareholders' Complaints at Meeting of Diesel Engine Company.**—At a meeting of the shareholders of the Diesel Engine Manufacturing Company, Limited, on Wednesday, Mr. Ellis, the chairman, informed his hearers of the remarkable disappearance of Dr. Diesel from the Great Eastern Railway Company's boat during the passage from Antwerp to Harwich on Monday night. The extraordinary news, however, did not prevent strong expressions of disapproval on the part of a number of shareholders at the absence of any accounts for the year, and, as a result of some pressing questions, the fact was elicited that the profits were not as large as the prospectus indicated.

**Auckland Electric Tramways Company.**—There is a surplus on the year's working of £54,178, making with £8,267 brought forward, a total of £62,445. The dividend on preference shares paid and accrued to June 30, 1913, requires £8,455, and an interim dividend on the ordinary shares for the half-year ended December 31, 1912, of 7d. per share, free of income-tax, was paid in May last, and amounted to £10,208. The directors recommend that £17,500 of the available balance be transferred to reserve account, bringing the account to £102,500, and that a further dividend be paid on the ordinary shares of 1s. per share, free of income-tax, for the half-year ended June 30, 1913, making a total dividend of 1s. 7d. per share for the year. This will require £17,500, and leave £8,782 to be carried forward. The traffic receipts, which amounted to £257,591, show an increase of £28,449. To provide the necessary funds for the company's purposes it is proposed to make an issue of £100,000 in ordinary shares.

**British Westinghouse Electric and Manufacturing.**—An extraordinary meeting was held on September 26 to consider resolutions authorising that the capital be reduced to £1,150,000. Mr. J. A. Bryce, who presided, said that the scheme had been delayed owing to the litigation between the company and the Underground Electric Railways of London. Their total claim outstanding against the Underground was approximately £122,000. The appeal to the House of Lords had been successful, they had got back from the railway company the amount they had paid under the award, and they recovered a further £42,500 with an understanding that their former friendly relations should be resumed. With regard to the scheme, the net total by which it was proposed that the capital of the company should be reduced was £725,000. Of that £225,000 would be applied to writing the ordinary shares down to £2 per share. The balance would be written off the preference shares. The resolutions were carried.

**Preston Corporation Tramways.**—In his report for the year ended March 31, which has just been issued, Mr. J. F. Simpson, engineer and manager, states that the sustained improvement in the trade of the town has been reflected in the returns, which show an increase in total revenue of £2,623, and an addition of 567,296 in the number of passengers. The financial results for the year, as compared with the previous year, are as follow :—

| | 1911—12. | | 1912—13. | |
|---|---|---|---|---|
| | Pence per car mile. | £ s. d. | Pence per car mile. | £ s. d. |
| Total income .. .. | 10.415 | 40,647 8 10 | 10.698 | 43,270 11 10 |
| Working expenses .. | 6.144 | 23,972 5 0 | 5.949 | 24,065 0 10 |
| Gross profit .. .. | 4.271 | 16,675 3 10 | 4.748 | 19,205 11 0 |
| Capital charges .. .. | 2.674 | 10,434 3 7 | 2.517 | 10,182 6 10 |
| Gross balance to reserve .. | 1.597 | 6,241 0 3 | 2.231 | 9,023 4 2 |
| Less special charges .. | — | — | .902 | 3,648 16 2 |
| Net balance to reserve fund | 1.597 | 6,241 0 3 | 1.329 | 5,374 8 0 |

The special charges include three new cars costing £2,412, covering top decks of five cars, new plates for accumulators, etc. The new cars are of the single deck, saloon type, and provide seating accommodation for 42 passengers. They were built by the United Electric Car Company, the electrical equipment being supplied by Messrs. Dick, Kerr and Company. In view of the success of the undertaking, the manager thinks that extensions to outlying districts might seriously be considered, "especially in view of the success that has attended the introduction of methods of traction which do not necessitate the use of expensive permanent way." The tramways department now employ 203 persons, and have about 10½ miles of route length and 33 cars. The car mileage is 970,719 miles, the average number of car miles per car per day being 132 miles. The energy consumption was 1.309 units per car mile, the power costs per unit being .384d., with an average power cost per car mile of food. The ratio of working expenses has decreased from 59.22 to 55.63 per cent.

**Dick, Kerr, and Company, Limited.**—The report states that the profits earned during the twelve months to June 30 last amount to £30,092, which, added to £10,016, the sum forward, makes a total of £40,108. Out of this sum the debenture interests have been paid, and there has been reserved the sum required to provide for the premium payable on the redemption of the present debenture stock. These items absorb £11,483, leaving £28,624 available. The directors propose to pay a dividend of 6 per cent. per annum on the preference shares, and to carry forward £10,324. Whilst the profits for the year are sufficient to cover the payment of the debenture interest and the preference dividend, leaving the profit to be carried forward slightly larger than the amount brought forward from last year, the directors regret that they are unable to recommend a dividend on the ordinary shares.

# COPPER AND ALUMINIUM MARKET.

October 3, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton :—

**Telegrams: "TRAMIGRO, LONDON."**
**Telephone; No. 2948 GERRARD.**

# WEEKLY LIST OF TENDERS INVITED.

### GLAMORGAN COUNTY COUNCIL.

TO CONTRACTORS.

THE GLAMORGAN COUNTY COUNCIL (MORRISTON TO PONTARDAWE) LIGHT RAILWAYS ORDERS, 1903 AND 1913.

The Glamorgan County Council is desirous of negotiating with engineering firms of standing who are prepared to undertake to construct, and to work when constructed, a Light Railway of the character of a Tramway about five miles in length, from Ynysforgan to Pontardawe in continuation of the section of railway about five furlongs in length commencing at the Swansea Borough Boundary already constructed and now worked as an extension of the Borough Tramways by the Swansea Improvements and Tramways Company, but which will form a part of the completed undertaking.

Plans of the proposed railway may be seen at the Glamorgan County Hall, Cardiff, between the hours of 10 a.m. and 4 p.m. (Saturday 10 a.m. and 1 p.m.), and further information obtained from the undersigned.

T. MANSEL FRANKLEN,
Clerk of the Glamorgan County Council.

### EAST INDIAN RAILWAY.

The East Indian Railway Company is prepared to receive tenders for the supply and delivery of—

1. Steam Turbines and Condensers, etc.
2. Turbo-Alternators.

As per specifications to be seen at the Company's Offices.

Tenders are to be sent to the undersigned, marked "Tender for Steam Turbines, etc.," or as the case may be, not later than 11 o'clock a.m., on Wednesday, the 29th day of October instant.

The Company reserves to itself the right to divide the order, also to decline any tender without assigning a reason, and does not bind itself to accept the lowest or any tender.

For each specification, a fee of £1 1s. is charged, which cannot under any circumstances be returned.

By order, C. W. YOUNG,
Secretary.

Nicholas Lane, London, E.C.,
October 9, 1913.

### SALE URBAN DISTRICT COUNCIL.

Tenders are invited from manufacturers for the supply, delivery, and erection of

A. Storage Battery.
B. Battery Charging Booster.

Specification and particulars can be obtained from Mr. C. J. Wood, Electricity Works, School Road, Sale.

The Council do not bind themselves to accept the lowest or any tender, and any acceptance will be subject to the sanction of the Local Government Board to a loan being obtained. Tenders to be in by 10 a.m. October 23, 1913.

D. HALLEWELL,
Clerk to the Council.

### CITY OF BRADFORD.

TRAMWAYS DEPARTMENT.

TENDERS FOR GENERAL STORES.

The Bradford Corporation are prepared to receive tenders for the supply of Miscellaneous Stores required by the Tramways Department during the year ending December 31, 1914, as follows, viz.:—

Schedule No.

1 Bolts, Nuts, Screws, Washers, Nails, Cotter Pins, Rivets, Brass Rod, Lead, Hack Saw Blades, Twist Drills, and Miscellaneous Ironmongery.
2 Files.
3 Lamp Fittings.
4 Insulating Material, Tapes, and Calico.
5 Sand Bags.
6 Copper Fuse Wire.
7 Iron, Malleable, and Steel Castings.
8 Phosphor Bronze, Gun Metal, and Brass Castings, Copper Controller Finger Contacts, and Drivers' Alarm Bells.
9 Insulated Bolts and Strains.
10 Bar Iron and Steel, and Galvanised Steel Sheets.
11 Oils and Grease.
12 Paints, Dry Colours, and Shellac.
13 Spirits and Acids.
14 Drysaltery and Disinfecting Fluid.
15 Paint Brushes and Cleaning Brushes.
16 Waste, Sponges, Washleathers, Cleaning Cloths, and Soap.
17 Transfers and Gold Leaf.
18 Glass.
19 Steel Pinions.
20 Delivery Hose, Indiarubber, Vulcanite Fibre, and Insulating Paper.
21 Timber.

Schedule and conditions of tender may be had on application at the Tramway Offices, 7, Hall Ings, Bradford, on payment of the sum of one guinea, which amount will be refunded on receipt of a *bonâ-fide* tender. (Cheques to be made payable to the order of the Bradford Corporation.) The contracts will be let subject to the Fair Contracts Clauses of the Corporation.

Samples can be inspected at the aforesaid Tramway Offices. Tenders endorsed "Tender for Stores," to be sent to me not later than Saturday, the 18th instant. The lowest or any tender will not necessarily be accepted.

FREDERICK STEVENS,
Town Clerk.

Town Hall, Bradford,
October 1, 1913.

### COUNTY BOROUGH OF WARRINGTON.

ELECTRICITY DEPARTMENT.

The Electricity and Tramways Committee invite tenders for the following:—

1. One 2,000 kw. Turbo-Alternator, Condensing Plant, Pumps, Piping, and Fittings.
2. One Water-Tube Boiler, Mechanical Stokers, Superheaters, etc.

Specifications and forms of tender may be obtained from the undersigned on payment of one guinea for each specification, which will be returned on receipt of a *bonâ-fide* tender. Five shillings will be charged for extra copies of specification.

Tenders, addressed to the "Chairman of the Electricity and Tramways Committee, Town Hall, Warrington," must be sealed with wax and endorsed "Tender for Turbo-Alternator" or "Boiler," as the case may be, and delivered not later than 12 o'clock noon on Tuesday, October 28, 1913.

The lowest or any tender will not necessarily be accepted.

F. V. L. MATHIAS,
Borough Electrical and Tramways Engineer.

Howley, Warrington.

## CITY OF BIRMINGHAM.

TRAMWAYS DEPARTMENT.

TENDERS FOR UNIFORM CLOTHING AND CAPS.

The Tramways Committee are prepared to receive tenders for the supply of Uniform Clothing and Caps for the Inspectors, Motormen, and Conductors.

Forms of tender may be had on application to the undersigned at the Tramway Offices, The Council House, Congreve Street, Birmingham. Tenders must be made on the form provided, and must be handed in not later than 12 o'clock noon on Monday, the 10th day of November, 1913.

The Committee do not bind themselves to accept the lowest or any tender.

Persons tendering must at the time of tendering and at all times during the execution of the works be paying all their workpeople not less than the standard rate of wages in the districts where such workpeople are actually engaged in the execution of the work, and must be observing the hours and conditions of labour recognised by the Associations of Employers and the local organised bodies of workers in the various trades in such districts. The contractor will be held responsible for the observance of these conditions by any sub-contractor employed by him.

The contractor must also agree to comply with and conform to the provisions of the Trade Boards Act, 1909.

ALFRED BAKER,
General Manager.

The Council House,
Congreve Street, Birmingham.

## NEWCASTLE-UPON-TYNE CORPORATION TRAMWAYS.

UNIFORM CLOTHING.

The Tramways Committee of the above Corporation invite tenders for the supply of Uniform Clothing for Inspectors, Time keepers, Depôt Clerks, Motormen, Conductors, and Overhead Linesmen, etc., for the twelve months ending March 31, 1915.

Form of tender and conditions of contract can be had on application to the undersigned.

Specimen uniforms can be seen at the Tramway Offices, Manors, Newcastle-on-Tyne.

Tenders must be sent through the post, addressed to the Chairman of the Tramway Committee, endorsed "Tenders for Uniforms," and must be delivered not later than November 4, 1913.

The Tramways Committee do not bind themselves to accept the lowest or any tender.

ERNEST HATTON,
Engineer and General Manager.

Tramway Offices,
Manors, Newcastle-on-Tyne,
October 6, 1913.

(*Continued on page 287.*)

Advertiser wishes to dispose of his copies of the illustrated issues of TRAMWAY AND RAILWAY WORLD from August, 1904, to September, 1909; perfect condition. Box 61, TRAMWAY AND RAILWAY WORLD, Amberley House, Norfolk Street, W.C.

## BIRMINGHAM'S LEAD IN OMNIBUS TRACTION.

If the scheme for the acquisition of the undertaking of the Birmingham and Midland Omnibus Company by the Corporation becomes an accomplished fact, Birmingham will become the operators of the chief municipal omnibus service. At present about a score of municipalities are either running motor-omnibuses or have obtained powers to do so, but in no instance are their services on so large a scale as those of the Birmingham Company, which is an offshoot of the local Tramway Company, the last of whose lines passed into the hands of the Corporation about a year ago. Before the transfer was effected the authority had willingly granted facilities for running omnibuses, but on one or two routes these vehicles have been succeeded by tramways. The desire of certain residential districts to retain omnibus facilities led to opposition to tramway proposals submitted to the Legislature, and a numerous party in the Corporation has strongly advocated the employment of the omnibus. The outcome of this championship of the self-propelled vehicle is seen in the acquisition by the Tramways Committee during the past year of several such conveyances in pursuance of their powers to run them in extension of tramway routes, and also in the decision arrived at a week ago to apply for general running powers. When this scheme has received the sanction of Parliament clashing would inevitably ensue between the Corporation and the Company, and in order to avert that contingency, the Tramways Committee, acting on the advice of their tramways manager, Mr. A. Baker, have wisely advised the Council to buy the omnibus undertaking. The purchase price has been fixed at £30,600, including the garage, which provides accommodation for nearly eighty vehicles and the complete plant for the repair of the fleet. Of the forty-nine double and single-deck machines owned by the company it is proposed to acquire thirty double-deck cars. When the announcement of the Committee's recommendation was made on October 4 an important point remained to be settled, viz., as to the running by the company from places outside the city to the centre of Birmingham, the Committee desiring to prevent competition with their tramways or any service of omnibuses they may set up between points inside the boundaries. The Committee suggest the fixing of a minimum fare for the company's omnibuses coming into and going out of the city, while the company claim that the amount should be much less than is suggested by the Committee. The point is an important one for the company, for they contemplate extending their services to all the important towns and districts within a twenty-mile radius and to some places beyond that distance. When this scheme is carried out the undertaking from its purely omnibus side will be second only to that of the London General Omnibus Company; indeed, it will serve a larger population outside of London than is the case with the latter. During the course of the next year or so similar enterprises may be looked for on the part of the motor-omnibus undertaking of the British Electrical Federation and of another company. An important lesson is to be derived by tramway undertakings from those enterprises and from the action of the Birmingham and other Corporations who have instituted motor services during the past twelve months. It is that while there are many localities to which tramway extension would not prove profitable, the motor omnibus can be used to test routes for both rail and railless electric cars, and to bring traffic to the tramways. Evidence that municipalities are more and more appreciating the value of the motor-omnibus is given in our news columns this week.

## A TRAMWAY AND RAILLESS COMBINATION.

The system of tramways and railless trolley routes belonging to Aberdare Urban District Council, the formal inauguration of which for public service took place on Thursday, forms the first systematically combined scheme of the sort conceived, constructed, and opened as one undertaking. The Glamorganshire Valley, in which the undertaking is situated, is, like others in South Wales, a hive of industry, coal mines and iron and other works being dotted along it. The centre of the locality is Aberdare itself, with a population of over 50,000, but industries straggle out to the south-east and north-west, and villages require connection with the town. There is no scarcity of railways in the district, and these are largely engaged in the coal traffic. Additional means of communication of a local kind was, however, felt desirable, and this led to the combined scheme of the District Council, which has now reached fruition. The combination of tramway and trackless trolley is thoroughly well suited to the locality. There is one through tramway route, single track with passing places, from Aberaman in the south-east through Aberdare to beyond Trecynon in the north-west, a distance of 2¾ miles. The depôt and the electricity station are in the centre of Aberdare. This trunk tramway line is fed by and acts as a distributor to four trackless trolley routes on the Cedes-Stoll system which run through outlying districts. From the southern end of the tramway one of these routes extends nearly a mile further south-east to a village called Capcoch. From the same point a second railless route reaches south-westwards up a side valley for a mile and a quarter to the village of Cumaman. In the centre of Aberdare the tramway sends off another railless spur north-eastwards

Digitized by Google

for nearly a mile to Abernant, while finally the tramway is continued from its north-western terminus by a trackless route for half a mile to Cwmdare. The total length of the trackless routes is thus 3½ miles. The point we desire to emphasise is the admirable sufficiency of the combined scheme to meet the wants of the district. The towns and villages are narrow in proportion to their length, so that no considerable population is to be found at any great distance laterally from the tramway or from the railless routes. Moreover, a scattered population, employed in mines and works, is to be found all along the railless routes, while at the same time the termini of the latter reach to what may be called the ends of the populated districts. Beyond these termini open country extends for considerable distances, though to the north-east Merthyr Tydvil is not so far away, and to the south-east a few miles distant is Mountain Ash. To these the north-east and south-east railless routes might be extended some day. But for the present we have a self-contained combined system, constructed at small cost and calculated to serve the population in a way which no other could do. The inauguration was highly successful, and the District Council, Messrs. Stephen Sellon and Partners, and the Cedes Electric Traction Company, as well as the local public, are alike to be congratulated on the completion of a really useful and efficient undertaking.

## ABERDARE TRAMWAYS AND RAILLESS TRACTION.

Inauguration Proceedings.

The electric tramways and railless trolley routes on the Cedes-Stoll system belonging to Aberdade Urban District Council, to which we briefly referred last week, were formally inaugurated on Thursday last. Members of the District Council, together with representatives of Messrs. Stephen Sellon and Partners, the consulting engineers, and of the Cedes Electric Traction Company, attended the opening run made by the cars, and everything passed off to the satisfaction of the gentlemen present. Later in the day the District Council and officials were entertained at dinner by the consulting engineers. The proceedings were presided over by Mr. T. Walter Williams, chairman of the council, supported by Mr. T. Ingliss Rudman, resident engineer, Mr. Beverley Griffin, and Mr. T. Williams, representing Messrs. W. Griffiths and Company, and Mr. J. Parkinson, representing Messrs. Clough, Smith and Company.

Mr. Beverley Griffin, in proposing prosperity to the town and trade of Aberdare, said that the events of the day showed that Aberdare was a progressive town, and he hoped that it would progress a little further so that the scheme might be extended to Mountain Ash, four miles away. Means of access to important towns meant a great deal in the way of commercial prosperity, and enabled the towns to keep abreast of the times.

The Chairman, in reply, said that the Council had taken an important step for the future of Aberdare. They had just concluded arrangements for an increased supply of water. He was of opinion that they depended too exclusively on the coal trade, but by providing electric power in the town they would encourage other trades and manufactures, and would enable small men to compete with larger ones.

Councillor L. N. Williams, in submitting the toast of "Success to the Aberdare Tramways," thanked Mr. Sellon for the invitation to the present function. They had seen a united send-off to the Aberdare tramways that day. For a long time they had been hoping to see tramway cars traversing the streets of Aberdare. During the construction there had been some misgivings and friction, but not, he thought, from selfish motives. Their duty was to make the best of the tramways and to study economy on all sides, and the system would become a boon and blessing to all. He expected that before long the tramway profits would reduce the rates of the district.

Councillor A. P. Jones, in response, referred to the difficulties which had been experienced in inaugurating what was for them a great public convenience. From appearances that day he was assured of a great success for the undertaking.

County Councillor William Thomas, in submitting the health of the contractors, said that all appreciated the great work which had been carried out during the past year. He had attended many troublous meetings, but he now felt recompensed. To the contractors the work, no doubt, had been a small one, but to the district it was great. The contractors told him that they never had a smoother run in their lives than that over the Aberdare tramways, and that these were bound to be successful. Personally he felt that the Aberdare tramway scheme was safe in the hands of Mr. Sellon. The contractors had met difficulties, but the Council were perfectly satisfied with what had been done. He wished the contractors every success.

Mr. Beverley Griffin, in response, said he was glad to see the consummation of the work. Their difficulties arose mostly from the weather, and he was pleased to say that there had been less grumbling in Aberdare than they had experienced elsewhere. He hoped the tramways would be even more successful than they anticipated.

Mr. Stephen Sellon, in proposing "Our Guests," said that life had many disappointments and vexations, but that did not debar them from showing friendly hospitality. Aberdare, apparently dead, had been wakened up to practical existence by electric tramways. He was pleased to see so many people who had the governing of Aberdare at heart, and he was especially pleased to see Aberdare placed above other districts, which from pure jealousy would proceed to copy Aberdare.

## DAIMLER ALLIANCE WITH THE L.G.O. WORKS

Sir Hallewell Rogers, in moving the adoption of the report presented to the shareholders of the Birmingham Small Arms Company at the annual meeting held on October 8, mentioned that the Daimler Company during the past year made a net profit, amounting in round figures to £128,000, on an investment which stood in the balance sheet at only £351,000. This might be regarded as very satisfactory, and he might further state that the aggregate profits of the Daimler Company for the four years during which they had owned that company had been upwards of £430,000. The extensions of the works which were now needed were the result of the adoption of a very progressive programme in the development of commercial vehicles and chassis for omnibuses. He was glad to be able to tell them that they had concluded arrangements which, while enabling this part of the business still to progress, was not likely to make for some years to come any further demands upon the capital resources of the company. The arrangement in question was a working alliance between the Daimler Company and the manufacturing undertaking connected with the London General Omnibus Company, known as the Associated Equipment Company, whereby omnibuses and certain sizes of commercial vehicles, for which there was a large demand, would be made at the factory of that company. The factory was, perhaps, the most modern one which had been constructed, and was on a very considerable scale, enabling any possible demands for that particular vehicle which they could forsee to be adequately and quickly met by that company for them. Incidentally another advantage accrued to the company from this alliance in removing from the field of competition an undertaking which would otherwise undoubtedly secure a large proportion of the orders going, having regard to its great and unique experience in the manufacture and operation of this class of vehicle. The London General Omnibus Company were operating a large number of omnibuses manufactured by the Daimler Company, and as a result of their experience with these vehicles had placed an order for a considerable number of Daimler sleeve valve engines for use with the General Omnibus Company's fleet. A satisfactory feature of this arrangement was that it enabled the Daimler Company to devote the resources of the existing works to the manufacture of types of commercial vehicles other than those to be made at the Associated Equipment Company's works, and at the same time enabling them to share in the profits.

Mr. E. Manville, in seconding the motion, emphasised the advantage of the arrangement which had been come to with regard to the acquisition of the output of another large factory, saving them, as he hoped, further expenditure on the Daimler side for many years.

The following dividends were agreed to:—On the preference shares at the rate of 2½ per cent., less income-tax, amounting to £4,782 0s. 0d.; on the ordinary shares at the rate of 5 per cent., together with a bonus of 1s. per share, free of income-tax, amounting to £76,608 4s. The sum of £10,000 is carried to the general reserve fund and £50,000 to machinery reserve fund.

## THE BADGE QUESTION AT NOTTINGHAM.

Nottingham Tramways Committee on October 7 received a deputation from the local branch of the Tramway and Vehicle Workers' Union, who asked for some provision to be made to protect the motormen from the rigours of the winter; the abolition of the bonus system; and permission to wear the union badge. The committee consented to receive a deputation on the first two points, but said they could not sanction the third proposition. Councillor R. H. Swain, the chairman of the Tramways Committee, afterwards stated that for some time he and Mr. J. Aldworth, manager, had been considering a "merit" scheme, and this would be introduced at the end of the year. The question of current would be one of the principal items in that scheme, but the details had not yet been completed. As to the wind screens, their provision would be seen to at once. The screens would be of canvas. A trial was made some time ago with canvas, and it was hoped that the new arrangement would prove satisfactory. "So far as the request for the wearing of the button is concerned," said Mr. Swain, "we have refused, as before." The men's executive met on the following day to receive the report and decide what course should be recommended to the quarterly meeting next Monday. The ballot resulted in an overwhelming majority for wearing the badge with or without the committee's consent.

## MISCELLANEOUS NEWS AND NOTES.

**Grimsby and Covered Tops.**—The Tramways Committee have been directed to consider the question of asking the Tramways Company to convert all their open top deck cars into covered tops.

**New Cars for Leeds.**—The Leeds Tramways and Electricity Committee propose asking the Board of Trade for sanction to borrow £45,600 for the purpose of providing new tramcars for the city. It is also intended to apply the side life-guard to the whole of the cars.

**Bradford Developments.**—It is proposed to erect a new and larger district depôt at the junction of Bolton and Idle Roads for the tramways department, and to provide additional car accommodation at Thornbury.

**Mud Splashing by Motor Vehicles.**—Camberwell Borough Council have asked the London County Council to obtain a by-law for the prevention of mud splashing by motor vehicles, the shopkeepers and pedestrians having frequently complained.

**Tramcar Ventilation.**—Bournemouth tramways manager has informed the Tramways Committee that he has arranged a simple method for ventilating the cars. As the result of their inspection of two cars so fitted, the committee have approved the arrangement.

**Protecting Tramway Passengers.**—For recklessly driving a horse and lorry past a number of people who were boarding and leaving a tramcar at Peel Street, Glasgow, a driver was at the Partick Police Court on October 7 ordered to pay £5, or go to prison for 30 days.

**Omnibuses for Municipalities.**—Lancaster Council have resolved to apply for Parliamentary powers for running motor omnibuses within the borough, and Coventry Tramways Committee have recommended the Corporation to purchase six omnibuses at a cost of £2,600.

**Inter-Running at Sunderland.**—The Tramways Committee have decided to apply for a provisional order for running powers to enable the District Tramway Company to run cars from Houghton to Fawcet Street. The District Company will bear the expense of the arrangements.

**A Remedy for Galloping.**—The Devonport and District Tramways Company have informed the Town Council that new trucks have been ordered for all cars numbered above 30, and it is hoped that when the new trucks are fixed the galloping, which is now fairly noticeable, will be done away with.

**A Special Tramcar for Creche Babies.**—The proposal for a special morning tramcar to take babies from the centre of Bury to the Whitehead crèche has for the present been abandoned. The proposal was tried on October 6, but only one child was given into the custody of the nurses who were in attendance to meet the mothers.

**Illuminated Route Indicators.**—The Potteries Electric Traction Company have decided to place time indicators at the Trent Vale and Dresden termini, but have informed Stoke Council that they are unable to install illuminated route indicators. The company added that they are experimenting with a device which they hope will meet the situation.

**Linking Up of the Swansea Tramway Routes.**—Major Pringle, of of the Board of Trade, has approved of the working of the new lines laid down by the Swansea Tramways Company for the purpose of linking up the various routes. While one of the two cars used on the occasion of the inspection was passing round the corner of Castle and Temple Streets the head of the trolley pole broke.

**The Season at Blackpool.**—The tramway receipts for the six months just ended amounted to £67,713, against £57,134 for the corresponding period of last year. As showing the influence of the illuminations along the promenade the receipts for the week ended October 4 showed an increase of £752 compared with the corresponding week of last year, and constituted a record for that period of the year.

**Over-Assessment of Tramways for Income-Tax.**—Report has been made to the Bournemouth Tramways Committee by the Borough Accountant that the claim made by the Council for refund of income-tax in consequence of over-assessment under Schedule D in respect of the three years ended April 5, 1911, had resulted in a repayment of £1,761. The committee have agreed that this sum be applied, £1,000 to a reserve fund and £761 to the renewals fund.

**More Omnibuses for Liverpool.**—Proposals are under consideration by the Tramways Committee for purchasing additional omnibuses in order to extend the services to districts not at present provided with means of locomotion. On October 6 the type of vehicle in use by the Sheffield Tramways Committee was inspected at Liverpool and tested on a route which included the Erskine Street hill. Other types of vehicle are also to be inspected.

**Birmingham Resisting Overhead Telephone Wires.**—The Birmingham stipendiary magistrate is hearing a series of test cases brought by the Corporation against the claim of the Postmaster-General to erect overhead wires for the development of the suburban telephone service. It is understood that the matter will be carried to appeal if necessary. An offer was made that when the number of overhead wires on a route exceeded 32, the service for 16 subscribers, underground communication would be substituted.

**Trail Cars on Aberdeen Suburban Tramways.**—Application has been made to the Board of Trade by the Aberdeen Suburban Tramways Company for permission to run passenger trail cars. The County Road Board have informed the Board of Trade that in their opinion the object which the company wished to obtain could be achieved by a more frequent service of cars, while the Aberdeen Tramways Committee have intimated to the Board of Trade that there is no loop on the company's line at the Mannsfield terminus suitable for handling trailers.

**Proposed Additional P.A.Y.E. Cars for Aberdeen.**—The Tramways Committee on October 3 opened tenders for the electrical equipment of six additional cars. It was resolved not to accept any offers at the present, but to obtain amended tenders from two of the firms. A report by Mr. Pilcher, general manager, on the P.A.Y.E. cars was submitted and considered. It was agreed to take no action until the committee had had time to inspect a wider staircase, which is being constructed at the tramways workshops.

**Bermondsey and Motor Omnibus Dangers.**—Bermondsey Borough Council having considered "the appalling and continuous slaughter of children in the borough by motor omnibuses," have decided to ask the Local Government Board to issue an order restricting the speed of motor vehicles to eight miles an hour through the main thoroughfares from London Bridge to Deptford Lower Road, and from the Bricklayers' Arms, Old Kent Road, to Deptford Lower Road. The streets are narrow and winding, with several abrupt turnings. In twelve months nine persons have been killed and seventy-three injured by motor traffic.

**Bournemouth and the Rating Appeal.**—The chief assistant overseer has called the attention of the Finance Committee of Bournemouth Borough Council to the effect of the recent decision in the House of Lords as to the rating of tramways—viz., that the general district rate for the tramways would be charged in full, instead of at the quarter rate for the running lines and appurtenances. He pointed out that a deduction of £712 10s. was made from the rates on the tramway undertaking for the year ended March 31 last, and that this sum had been allowed as irrecoverable and passed by the auditor. The committee decided that the current rate be amended under Section 221 of the Public Health Act, 1875, and the increased rates charged as from April 1, 1913.

**First Petrol Tramcar in Scotland.**—The Lanarkshire Motor Company, of Glasgow, have fitted a tramcar with a petrol engine. It is to be operated by the Stirling and Bridge of Allan Tramway Company, the last of the horse-drawn tramcar undertakings in Scotland. The car, which was tested on the Glasgow Corporation tramways, holds 20 passengers inside and 24 outside. The four-cylinder engine develops 25 h.p., and it is cooled by a radiator placed on the roof. The drive is through a three-speed gear box to double bevels lying centrally between the axles, and by means of a double sprocket the drive is taken to both axles. The car can be driven in either direction. The brakes are operated by foot and hand levers, and the driver is seated.

**London Police and the Stopping Places of Omnibuses.**—In reply to representations made by Ilford Tramways Committee, the Commissioner of Police has informed them that the police had instructions to prevent, as far as possible, motor 'buses and tramcars from stopping level with each other, and also to see that the slow-going traffic was kept as much as practicable to the near side of the road. Renewed attention had, however, been called to the matter, and the police would continue to do all in their power to obviate danger to pedestrians and obstruction to traffic. At the meeting at which the communication was received Councillor Golightly said he had seen three 'buses line up at Stratford Market with the evident intention of preventing people getting on the cars.

**The Arbitration Difficulty at Sheffield.**—It will be remembered that the Sheffield tramways employees although willing to submit to an arbitrator their difference with the Tramways Committee as to time and a half pay for Sunday duty, were unable to agree to the terms of reference drawn up by the Town Clerk for consideration by Judge Benson. The general manager has now received a letter from the Association of Tramway and Vehicle Workers stating that they would prefer to leave the case in the hands of the Tramways Committee, but they asked the committee to consider an application on behalf of certain employees not already in receipt of time and a half pay for Sunday after five years' service with the department. The general manager has been directed to report on the request.

**Newport to Apply for Motor Omnibus Powers.**—The Tramways Committee on October 7 decided to recommend the Council to apply for powers to run motor omnibuses on nine routes. This decision was arrived at after consideration of a report on additional means of transport in the borough and adjacent districts by Messrs. N. J. Young, general manager of the Electricity and Tramways Department, and A. Nicholls Moore, the electrical engineer. The report pointed out that a company had already obtained Parliamentary powers for running a system of railless cars in an adjacent area, and propose extending the service to within the borough. Messrs. Young and Moore suggested that the Corporation should maintain the monopoly they now enjoy within their own boundaries, and also advised extension. They pointed out that the motor 'bus had so far found most favour for such work.

## CONTRACTS AND ORDERS.

**United Electric Car Company,** of Preston, have received a contract to supply two top-deck covers for cars to Lancaster Council.

**Maudsley Motor Company,** Coventry, have received a contract from the City Council for the supply of six 40 h.p. omnibuses, at £730 each.

**Blackpool Council** have sealed a contract with Richardsons, Westgarth and Co. for the supply of a 1,000 kw. turbo-generator and condensing plant.

**Bury Council** have accepted the tender of J. Musgrave and Sons for the supply of a 3,000 kw. turbo-alternator with exciter and surface condenser.

**Dundee Tramways Committee** have accepted the tender of Mr. D. Horsburgh for excavating, concreting, and paving, etc., the road in connection with the extension of the Blackness Road tramways, at £6,471.

Digitized by Google

**Derby Council** have accepted the following tenders:—British Thomson-Houston Company, Limited, switchgear, £943; Simkiss and Knighton, cast-iron piping for turbine, £246; Alton and Co., steel piping for turbine, £142; Newton Bros., balancer, £179.

**Thermit, Limited,** have on hand at the present time tramway rail welding contracts at Bradford, Burnley, Brighton, Bournemouth, Dublin, Dundee, Huddersfield, Leeds, Liverpool, London County Council (four contracts), London United Tramways, Manchester, Sheffield, Southampton, etc.

**Messrs. Belliss and Morcom and Siemens Bros.** have supplied the turbine and generating plant installed in the Croydon Corporation electricity station. The capacity is about 3,000 h.p. and the cost £7,000. The turbines can be worked either with high-pressure steam or with exhaust steam, and a great saving in the coal bill is thereby anticipated.

**Sheffield Council** have accepted the following tenders:—Tramway tie bars and anchor joints, Bayliss, Jones and Bayliss, Limited, Dorman, Long and Co., Limited; tramway rails, Steel, Peech and Tozer, Limited; e.h.t. switchgear at Neepsend Station (extension of contract by four additional panels), A. Reyrolle and Co., Limited, Hebburn-on-Tyne, at £2,453.

**Hurst, Nelson and Co.** have received a contract from Leeds Corporation for the supply of tramcar bodies and trucks, at £12,850. Alderman Tetley informed the Council that their own car works could not turn out the cars sufficiently quickly, and that this tender was practically the lowest one received. Tenders for the erection of a car shed at Beckett Street are to be advertised for.

**Cardiff Council** have accepted the tender of Messrs. Fraser and Chalmers for a turbo-generator for the Roath Power Station at £6,345, and the tender of the British Westinghouse Company for a 1,000 kw. rotary converter, for the Hayes sub-station, at £1,055. Mr. A. Ellis, the electrical engineer, recommended the purchase of the 1,000 kw. converter instead of a 700 kw. plant, as the larger one would ultimately effect a saving in cost and space.

**Glasgow Tramways Committee** have awarded contracts as subjoined:—Steel traction poles, Stewarts and Lloyds, Limited; copper collector bushes, General Electric Company, Limited; motor gear cases, Electrical Engineering and Equipment Company, Limited; bastian radiators, Gillespie and Beales; lighting fittings, Falk, Stadelman and Co., Limited; supplying and fitting up an electric clock at the junction of two roads, W. Silversteer and Co.

## PERSONAL.

**Mr. Frank Buckley,** tramways manager to Wigan Corporation, has been granted an increase in salary of £25 per annum.

**Sir John Courtis,** chairman of Cardiff Tramways Committee, was welcomed by the members on October 7 on his return from his Canadian tour.

**Mr. Alfred Clough,** late resident electrical engineer to the Liverpool Corporation, has been presented with two divan chairs and an illuminated address by the electric supply department. The presentation was made by Alderman Fred Smith, chairman of the Tramways and Electrical Power Committee, who was supported by Mr. C. W. Mallins (tramways manager), Mr. H. Dickinson (city electrical engineer), etc.

**Mr. H. S. Banner** has been appointed an inspector on the Southport Corporation tramways. Mr. Banner entered the service in May, 1902. In March, 1906, he was granted a merit badge for neat appearance, attention to passengers, and general good conduct. These badges, which are not now awarded, carried with them an additional 1s. a week. In 1907 he was appointed a motorman, and in January, 1910, he was made deputy inspector.

**Mr. G. Cardwell,** general manager of the Devonport and District Tramways Company, as briefly reported in our last issue, was presented with a silver tea and coffee urn by the staff and employees on the occasion of his marriage. The presentation was made at a dinner and smoking concert, Inspector Murton presiding. Acting Chief Inspector Goodridge made the presentation, and on behalf of the staff wished Mr. and Mrs. Cardwell the best of health. Mr. Cardwell thanked the donors for their kindness.

**Mr. T. B. Holliday,** general manager and electrical engineer to the Hastings and District Tramways Company, was reported at a meeting of the Town Council on October 3 to be ill. He had, however, supplied the following figures showing the increase in the number of passengers carried by the company:—Year ended August 11, 1913, 8,695,813; 1912, 8,476,681; increase, 219,132. Six months ended August 31, 1913, 4,908,097; 1912, 4,524,223; increase, 383,874. Month of August, 1913, 1,224,223; 1912, 1,070,000; increase, 154,223.

**Sir Wm. Clegg,** chairman of the Sheffield Tramways Committee, took part in a discussion by the City Council on October 9 on a report from the Tramways Committee recommending the Corporation not to adopt proposals made by trade unions that all Corporation employees shall be members of trade unions, and that all firms employing non-union labour in departments affected by Corporation contracts shall be excluded from tendering for contract work. Sir William supported a proposal to refer the matter back in the hope that a modified resolution might be arrived at. It might, he suggested, be made a basis for discussion that when vacancies arose preference should be given to trade unionists, all things being otherwise equal. The committee agreed to receive a further deputation.

**Mr. J. S. D. Moffet,** who, as recorded in our issue dated October 5, was presented with a canteen of cutlery on leaving the managership of the Rochdale tramways to take up similar duties at West Ham, was the subject of some complimentary remarks made by the chief officials of the Corporation. The Town Clerk (Mr. W. H. Hickson) referred to the able assistance he received from Mr. Moffet in connection with Parliamentary Bill work, especially that relating to the extension of the Whitworth section and to the Bury Corporation Bill. Mr. L. S. Platt, borough surveyor, mentioned that Mr. Moffet came to Rochdale as one of his assistants. He paid tribute to the efficiency with which he superintended the construction of the tramways in the borough and adjacent area. Having been so closely associated with the initial work, following the municipalisation of the system it was fitting that Mr. Moffet should obtain the general managership. All through the years of Mr. Moffet's service in Rochdale they had been in most friendly co-operation.

**Dinner to Mr. and Mrs. Wyld.**—Mr. W. Wyld (late manager of the Birkenhead Electricity Supply Company and Tramway Department) and Mrs. Wyld were entertained by a number of friends to dinner at the Imperial Restaurant, Regent Street, W., on October 3, to welcome them to London and to congratulate Mr. Wyld on his appointment as borough electrical engineer to Hampstead Corporation. The chair was taken by Mr. H. E. Blain, who, after the loyal toast, proposed the health of the guests. Mr. Wyld responded, and gave an amusing biographical sketch of his career. Commencing with Blackpool, he took the company in imagination to Salford, Wednesbury, Doncaster, and Birkenhead, finally landing them at Hampstead, with which he expressed great satisfaction. An impromptu speech was made by Mr. Harry England (Wakefield). The health of the chairman was proposed briefly by Mr. C. Newton Russell. Mr. Barfield (hon. sec.) and Mr. Barallet (hon. musical director) also contributed short speeches.

## FINANCIAL REPORTS AND MEETINGS.

**Anglo-Argentine Tramways.**—The directors have declared an interim dividend of 4 per cent., less income-tax, for the half-year ended June 30.

**Calcutta Tramways Company.**—An interim dividend at the rate of 5 per cent. per annum (2s. 6d. per share), free of income-tax, on the ordinary shares for the past half-year is announced.

**Hurst, Nelson and Co., Ltd.**—The profits for the past year were £61,057. The directors recommend that the preference share dividend be paid to November 11 next, that £5,650 be reserved to provide for the following half-year's dividend, that £10,000 be added to the reserve fund for security of dividends on preference shares, and that a distribution of 5s. per share be made on the ordinary shares, free of tax, leaving £2,257 to be carried forward.

**Record Half-Year at Leeds.**—The earnings of the Leeds tramways for the half-year ended September 30 amounted to the record total of £223,059, an increase of £14,581 as compared with the total for the corresponding half of the last financial year. The passengers carried numbered 47,996,569. The district served by the tramways comprises a population of 525,000, and the average amount expended in car fares per head of the population during the half-year is calculated at 8s. 5d.

**The British Electrical Federation.**—The traffic statement for the week ended October 3, 1913, shows that the receipts from tramways and railways amounted to £42,864, as compared with £38,335 in the corresponding week last year, and from omnibuses £3,072, as compared with £1,195, making a total of £56,536, as compared with £39,530. The tramway and railway route mileage was 429.82, as compared with 431.52. The Federation now have 514 omnibuses, an increase of 422 within the year. Upon such of the services as were working, both last year and this year, the receipts show an increase of £4,706 upon the week.

**The Half-Year at Bradford.**—The tramway receipts for the half-year ended September 30 show that the receipts amount to £158,622, as compared with £147,901 in the corresponding half of 1912. This is an increase in receipts of £10,721, or 7 per cent. The car miles run were 3,156,070, as compared with 3,033,869, an increase of 122,201 miles, or 4 per cent. The passengers carried during the half-year numbered 34,227,530, as against 31,009,972 in the corresponding six months of last year, an increase of 3,217,558, or 10 per cent. The cost per car mile has increased owing to the advance of wages to practically every member of the staff, the payment of full sickness benefits to men who are absent from duty owing to illness, and track maintenance costs.

**Deficit on New South Wales Tramways Working.**—The report of the Chief Commissioner of the New South Wales Railways and Tramways for the year ended June 30, 1913, gives the following figures in regard to the tramways:—

| | | Increase over last year. |
|---|---|---|
| Revenue ... ... | £1,754,566 ... | £173,173 |
| Expenditure ... ... | £1,572,190 ... | £246,777 |
| Passengers carried ... | 204,445,452 ... | 27,665,606 |
| Tramway mileage ... | 26,054,767 ... | 2,592,548 |

The net result, after providing for working expenses and interest on the capital invested, is a deficit of £32,456, to which the increased salaries and wages payable under Wages Board awards were a contributing factor. During the year tramway extensions totalling 12 miles 14 chains were opened, making the line mileage 207¾, while a number of new lines are under construction and further extensions are contemplated. Good progress has been made with the erection of the new tramway power house at White Bay, Balmain, and portion of the plant has been erected on permanent foundations and is now under steam. The total staff employed in connection with railways and tramways on June 30 numbered 41,322, as compared with 37,605 in the previous year, an increase of 3,717.

**Sao Paulo Tramway, Light and Power.**—The usual quarterly dividend of 2½ per cent. has been declared, payable on November 1.

**Greenock Tramways and Municipalisation.**—Mr. H. Ritchie, accountant, Greenock, has prepared a report for the Tramways Committee of Greenock Corporation in connection with a proposal to municipalise the undertaking. He states that if the undertaking should be acquired at the present capital of £252,500, and if the sum were repaid in 30 years with 3½ per cent. interest, an annual payment of £12,641 7s. 4d. would be required. The average amount for traffic receipts during the past 11½ years was £31,330, but Mr. Ritchie thinks that the increase in the last two years has been largely due to the prosperous condition of trade, and in taking this question into consideration the average sum was the only safe and fair amount to be reckoned on. The Corporation are entitled in their option to terminate the lease of the company at periods of 14 or 21 years—namely, at May 15, 1914, and May 15, 1921; and in this event a valuation will be made of the fair market value. On the expiry of the lease in 1928 the Corporation will have the right to purchase on a valuation upon a basis of the then value as defined by Section 43 of the Tramways Act, 1870, which is to be exclusive of any allowance for past or future profits, or any compensation for compulsory sale or other consideration whatever.

**Dick, Kerr and Co.**—Presiding on October 9 at the ordinary general meeting of Dick, Kerr and Co., Ltd., Mr. Claud T. Cayley said he was glad to meet the shareholders with a better showing of results than was the case last year. Although they had been obliged to face a considerable diminution in profits in recent times, the directors had consistently adhered to what they believed to be a sound and conservative policy in regard to depreciation at the works. The stocks in hand and work in progress, which referred only to the manufacturing side of the business, showed an increase of £31,000. This was the high-water mark on this account in the history of the company, and although it locked up more of their capital from a financial point of view, it might be regarded as a favourable sign in other respects. Debtors' bills receivable and outstanding balances on contracts had increased by £71,753, and sundry investments were £28,000 less. The latter item was accounted for by the sale of certain securities and by the writing down of the book value of the investments by the amount of the special reserve of £10,000. This reduction was to a large extent set off by the increased cash balances. There was a net increase of assets over liabilities on those accounts of nearly £60,000; and then they had to take into consideration the increase in the value of the stocks and work in progress, viz., £31,000. The banker's loan was accounted for by the increase in the amount of capital they had been called upon to provide in the shape of increased stocks and increased debtors. The demand for extra working capital was the result of expansion in their manufacturing branches. The board considered that the business, as a whole, was most satisfactory, and they were extremely pleased to be able to meet them with a better result than that which they put before them last year. They were extremely busy in the works; in fact, they had never had more work than they had at the present time. The report was adopted.

## POSITIONS VACANT.

### COUNTY BOROUGH OF STOKE-ON-TRENT.

ELECTRICAL ENGINEER'S DEPARTMENT.

SWITCHBOARD ATTENDANT.

Applications are invited from competent candidates for the position of Switchboard Attendant in one of the electricity works of this County Borough.

Forms of application and list of duties can be obtained on application to the Borough Electrical Engineer, St. Peter's Chambers, Glebe Street, Stoke-on-Trent.

Wages will commence at the rate of 27s. 6d. per week.

E. B. SHARPLEY,
Town Clerk.

October 4, 1913.

### BLACKBURN CORPORATION.

ELECTRICITY DEPARTMENT

SWITCHBOARD ATTENDANT.

Wanted for E.H.T. three-phase and D.C. three wire switchboards. Commencing wage, 30s. per week. Apply not later than Friday, October 17, stating age, previous experience, and enclosing copies of testimonials to the Borough Electrical Engineer, Jubilee Street, Blackburn.

### BOROUGH OF WEDNESBURY.

SHIFT ENGINEER.

Applications are invited for position of Shift Engineer from those having experience in a gas-engine station, with engines of 200 h.p. or over. Reply, stating age, experience, and commencing salary required, to

W. FENNELL, M.I.E.E.,
Borough Electrical Engineer,
Wednesbury.

### ENGINEER.

Wanted, an Engineer to act as Assistant Manager to a Tramways operating about 40 Cars; thorough knowledge of Car-shed and Central Station work essential and some knowledge of outside work desirable. Salary to commence £200 per annum.

Extensions and re-construction in prospect—an interesting position for an active man. Applications will be treated as confidential. Address Box 473, Office of this Journal.

## COPPER AND ALUMINIUM MARKET.

October 10, 1913.

THE Tramway & Railway World
WITH MOTOR TRAFFIC SECTION

ESTABLISHED 1892. LONDON, OCTOBER 16, 1913. VOL. XXXIV.

# TRACKLESS TROLLEY INSTALLATION AT KEIGHLEY.

BY HARRY WEBBER, A.M.I.E.E.
*(Electrical Engineer and General Manager, Keighley Corporation Tramways).*

Probably one of the most interesting questions which is occupying the attention of tramway managers and electrical engineers generally is how to deal with the traffic in districts where only a very limited revenue may be expected, and at the same time how to make the enterprise a financial success. The latest, and what appears to be the most satisfactory, method of dealing with this problem, is the adoption of electrically-propelled vehicles running on the road surface without rails but collecting the electrical energy from overhead conductors in various ways.

In this article I propose to deal principally with the system installed at Keighley, and I think it would be useful to anyone interested in this subject to know the chief reasons why the "Cedes-Stoll" system of trackless trolley vehicles was adopted. I will also add a few remarks to show what the results have been after about four months' practical trial in regular service for passenger traffic.

Cedes-Stoll Car Turning at Ingrow Terminus.

Cedes-Stoll Car in Service at Keighley.

Petrol-driven motor omnibuses had already been tried in Keighley on the same routes on which it is now proposed to adopt trackless trolley vehicles, but unfortunately, after four years' experience, it was generally accepted that the petrol-driven omnibus was not a financial success in Keighley, owing to the fact that the costs averaged 1s. 3d. per omnibus mile, whilst the receipts did not exceed an average of 11½d. per mile. It was largely owing to the experience gained in connection with the motor omnibuses, that the Visiting Committee of the Keighley Corporation decided to look out for a system which had the smallest possible amount of gearing and other mechanical contrivances. Full powers were obtained from Parliament by the Keighley Corporation Act, 1912, to equip a number of routes with overhead wiring for the purpose of running trolley vehicles. In order that the position in Keighley may be made perfectly clear a few leading features of some of the restrictions imposed upon the Corporation by Parliament may be given.

1. Vehicles when fully loaded with passengers must not exceed a weight of 5 tons each. This in my opinion is one of the most important restrictions imposed, and was partly responsible in guiding the Council to the decision to adopt the Cedes-Stoll system, owing to the light weight of its mechanism.

2. The carriage way for county and district roads should not be less than 15 ft. wide (with certain provisions).

3. No post or other apparatus must be erected on the carriage way except with the consent of the Board of Trade and the road authority.

4. No trailers must be used in connection with the trolley vehicles without the consent of the Board of Trade and the consent in writing of the County Council.

Besides these restrictions, the Board of Trade have not yet sanctioned the adoption of double-deck trackless trolley vehicles, although I believe a certain amount of

Digitized by Google

pressure is being brought to bear on this point by some authorities where double-deck vehicles are considered essential.

Before embarking on the whole of the work sanctioned by Parliament, it was decided in Keighley to equip about 1¾ miles as a trial length. The three systems considered were :

The "R.E.T." system already installed in Leeds, Bradford, and elsewhere.

The "Bremen" system as put forward by the Brush Company, although no actual installation was then working in this country.

The "Cedes-Stoll" system, a small length of which was available at West Ham for inspection purposes.

The third was the system which appealed to the Visiting Committee as being the greatest improvement on petrol-driven motor omnibuses. The other types require differential gears and some form of mechanical driving between the motor and the axles. After a full inspection of all the existing routes, it was decided to accept the Cedes-Stoll tender for 1¾ miles of equipment on the following conditions, viz. :

1. That the Cedes Electric Traction Company, Limited, lent a vehicle for three months free of charge.

2. If after the end of three months' running the system was deemed to be unsatisfactory, the company would be required to convert the overhead equipment to suit any other form of current collection required.

On the other hand, if everything was perfectly satisfactory, the Keighley Corporation agreed to place an order for two trackless trolley vehicles with the company besides the 1¾ miles of overhead equipment. I may say that the company were so confident of achieving good results that they accepted these very onerous terms. The sub-contractors for the overhead equipment were Messrs. Clough, Smith, and Company, Limited, of Spencer House, South Place, London, E.C.

It may be as well to remark here that my subsequent experience of the running of this trial route shows that a great deal depends on the proper erection of the overhead wires in connection with any system of over-running collection, and I think the fact that the current collector has never given us any trouble during the four months' operation points to the excellent manner in which Messrs. Clough, Smith, and Company carried out their part of the work.

During the tour of inspection the Visiting Committee heard a good number of "fairy tales," principally directed against the motor of the Cedes-Stoll vehicle, and the following are a number of points I raised upon the system generally, and included in my report to the Corporation upon the subject.

1. Should the vehicle be stopped in the middle of a fairly steep hill, will it be able to gather speed again quickly without causing the motors to take an excessive amount of current, producing liability to overheat, and breaking down the insulation ?

2. I presume the motors are run in series on ordinary flat ground, but when starting off from a stop in the middle of a hill it would be necessary to put them in parallel, which means that the insulation would then get the full 500 volts instead of the half voltage which they have on normal flat ground.

3. Will you guarantee your motor to run satisfactorily for fairly long distances with the motors in parallel, and the insulation subjected to 500 volts ?

Assuming the cars to meet in a very dark spot on the road after dusk in the winter time, what provision do you make so that the drivers are not left in pitch darkness when the connection is taken out ?

4. Assuming the driver accidentally let go the collector on a hill, would it not run away down the wires before he could recover it ?

5. What is the total weight of the current-collecting device, with automatic cable extension and balance weight ?

6. It has come to my knowledge that in one town on the Continent, the engineer in charge of the system says that the hub motor is the bane of his life, principally due to getting water on to the brush gear.

Assuming a driver has to look to his brushes on a stormy night, I cannot conceive how he could prevent rain driving in during the operation. Perhaps you might state what is the procedure in such a case on some of your existing routes.

7. Is it not a fact that if the tyres are worn down, and the road has fairly large stones on it, it is more than probable that the brake block will foul and become damaged ?

8. Is it not a fact that a lot of trouble is experienced with the current collector getting off the wires ?

9. What is the efficiency of your hub motor ?

10. How many different speeds is it possible to run your 'bus on a hill with about 1 in 15 gradient ?

11. Would you be prepared to sell a 'bus on the understanding that if before the end of 12 months the purchasers could prove that the difficulties under working conditions were far greater than any other system, then you would take the 'bus back, or else overcome the difficulties in a satisfactory manner ?

12. In designing the motor, what current density is allowed per square inch of copper when working on full load ?

To all these queries the company replied satisfactorily, and the behaviour of the motors on the vehicle lent to us has subsequently corroborated the replies sent.

The following is another extract from my report which will show that I was very much inclined to doubt the capabilities of a hub motor of this description at the outset.

There are two particular features of this system. One is that the motors are contained in the hubs of the back wheels ; consequently, no spur wheels or chains are required for driving. The axle itself does not turn round ; simply the rims of the wheels are moved by repulsion of the field magnets, which are bolted rigidly on to a square bar passing underneath the car. The rim of the wheel contains the armature of the motor, and this is carried by two sets of ball bearings, one at each end of a sleeve. On the outer side of the wheel there is a circular cover plate fixed by some small set screws. There is a circular tongue on this cover which fits into a recess, at the bottom of the recess being a rubber ring, and this is claimed to make the motor absolutely water-tight. A demonstration was given showing that the cover plate can be removed in about half-a-minute. Upon its removal the most vital parts of the motor, consisting of the commutator and brush gear, became exposed. Owing to the fact that the rims of the wheels are the only revolving parts in the driving mechanism, it is necessary to arrange the brakes on some portion of these.

This is effected by a brake drum screwed on to the armature. As one portion of this is revolving whilst the cover plate is stationary, it is questionable whether this part of the motor is water-tight. Another point which was apparent is that with the tyre worn down very near to the rim it only leaves a slight clearance between the outside of this brake drum and the road surface itself ; consequently it is possible by passing over a large stone to ride on the brake drum instead of the tyre, in which case this would have to take a large portion of the weight of the vehicle. As the castings are of a frail nature, it is only to be anticipated that some part would break. It was stated that the motors shown were of 22 H.P. capacity, but it appeared to me that this output was extremely large for the space available. The other special feature of this system is that instead of trolley poles carried on the top of the vehicle, as at Bradford and Leeds, there is a small flexible wire which is pulled out and wound up on a drum automatically to suit the particular distance the car is from the overhead wires. The current collector device attached to this flexible wire consists of a small carriage supported on four wheels. The connection with the overhead equipment is easily detached by means of a spring socket, and should the vehicle be accidently driven too far from the overhead wires this pulls out automatically instead of rupturing anything on the tension drums or flexible wires.

The principal advantages claimed for the Cedes-Stoll system of current collection is that it saves a lot of weight on the top of the vehicle and is far more flexible than the under-running trolley pole. Also, it is very easy to effect a passing with a trolley vehicle coming in the opposite direction. The drivers simply disconnect their overhead current collectors at the socket already mentioned and exchange, the consequence being that the collector which was coming down the hill goes back with the vehicle that is coming up the hill, and *vice versa*. Naturally there are several disadvantages to this mode of collecting current, the principal being that as the carriage runs on the top of the wires it is quite impossible to work this particular form of collector on the existing tramway overhead equipment, and in order to get the vehicles home into the car shed it would be necessary to adopt one out of four alternatives, namely :

(1) To tow the vehicles home behind a tramcar. This would occur every night and morning.

(2) To have a small pole fitted on the top of the car together with a brake shoe (which could be lowered on to the rails) as well as the flexible equipment.

(3) To run a special overhead equipment right to the car shed, simply for these vehicles to travel home on.

Digitized by Google

(4) To house these new vehicles in some shed within easy reach of the new overhead equipment.

Another point which is a disadvantage to the over-running collector appears to be a possibility of the whole collector leaving the wires, and coming down on the top of some unfortunate pedestrian's head. As this apparatus weighs at least 24 lb., it will be appreciated that such an occurrence may result in fatal consequences.

From the extracts quoted, it will be seen that the Council at Keighley were kept fully acquainted with the possibilities of what might happen, and consequently I think that the action of the Tramways Committee in placing an order for two vehicles with the Cedes Electric Traction Company at the expiration of the three months' trial period speaks for itself that the equipment has given every satisfaction. The travelling public seem greatly to appreciate the new system.

I will now give a few leading particulars of the construction and cost of the overhead equipment. The exact length is 1 mile 1,400 yards, and the contract amount for this was £1,610. Lattice poles were adopted and the overhead conductors suspended on the solid system to bracket arms. No feeder cables were necessary, the positive wire being simply tapped on to one of the existing tramway trolley wires. A positive and a negative grooved wire were arranged for with mechanical ears, it being decided that the vehicles in passing each other should simply change over current collectors. This operation has not yet been tried in Keighley, but providing the sockets are so arranged that it is impossible to reverse the leads from positive to negative when making the exchange, this appears to offer very little difficulty. One particular advantage with a flexible collector instead of an under-running trolley boom is that there is no necessity to have a circle at each end of the line to enable the vehicles to turn round, the two wires simply requiring to be anchored to a good stiff pull-off pole. With the under-running system it is necessary to erect four wires instead of two.

Up to the present time the return wire is effectively attached to the rails, and earth plates are sunk at every half-mile sectioning pole. The guard wiring has been erected to comply with the Post Office requirements, and is earthed to the return wire at about every other span. Since an examination was made, the vehicle lent to the Corporation has accomplished just over 5,000 miles, and the current consumption has been seven-eighths of a Board of Trade unit per mile run.

The route lies on a hillside and is a steady incline from the beginning to the terminus, the gradient in places being 1 in 11.

I have paid particular attention to the wear on the tyres, and estimate this to be only one-quarter of what takes place on our petrol-driven omnibuses. This is a very important saving, as our present contract for tyres on motor omnibuses is 2d. per 'bus-mile, the actual cost last year for the tyres alone being over £700 on an average service of three motor omnibuses.

I may say that the road surface on which the vehicle has accomplished the 5,000 miles is of a very ordinary character, no special preparation having been made, and I have taken particular notice as to what effect the trackless trolley vehicle has had upon the road during the last four months. From my observations I consider that the wear and tear of the road surface with this particular form of traction is negligible. This can be attributed partly to the very light weight of the vehicle when fully loaded, and the fact that the system is extremely flexible, allowing the driver to avoid keeping in one recognised groove. I should estimate that the wear on the road surface, as compared with petrol-driven motor omnibuses, bears about the same ratio as the wear on the tyres—that is to say, the omnibuses would

Current Collector of Cedes-Stoll Car over Motor Omnibus.

Showing Simple Manner in which Wires Terminate.

Digitized by Google

destroy the road surface four times as quickly as the Cedes-Stoll trackless trolley cars.

The capital cost of the new vehicles (two of which are at present on order) will be approximately £720 each equipped with tyres, thus making a sum of £1,440 to be added on to the £1,610, and allowing a further £200 for housing accommodation, this makes a total of £3,250 as the capital outlay in connection with the particular route being dealt with. The period for repayment of capital expenditure authorised by Parliament was 10 years in connection with the trolley vehicles, and 20 years in connection with the provision of electrical equipment and the construction of any other works necessary for the working of trolley vehicles. The interest and sinking fund necessary to extinguish the debts in the time mentioned on the capital expenditure of £3,250 would be approximately £300 per annum. Taking the number of miles run on this route last year by the motor omnibuses, namely, 21,573, and by dividing this number of miles into the £300, it gives a figure of 3·338d. per mile run which must be earned in order to cover interest and sinking fund charges above.

Compared with figures which have been published in connection with other trackless trolley equipments this figure is very moderate. The average revenue obtained up to date is almost exactly 12d. per mile, thus leaving 8·662d. per mile for all working expenses and cost of electrical energy. No reliable figures can be quoted at the present moment in connection with working expenses, but with electricity at 1d. per unit, the power comes out at ·9d. for every mile run. From experience gained up to this date I should estimate that the working expenses, including power costs, will not exceed 6½d. per mile.

Seeing that the driving movement is obtained through an air gap, which can be aptly termed a magnetic coupling, the vehicle starts off in the smoothest manner possible without any shock or jar, and runs almost as smoothly as an ordinary tramcar on rails.

It should also be borne in mind that I am quoting experience obtained with a vehicle which was designed for Continental roads and conditions. It is expected that the new vehicles on order, which are being constructed to meet British conditions, will give even better results than those at present being obtained.

One part of the equipment deserves special mention, namely, the controller that is shown in one of the illustrations. This is specially designed and constructed for easy renewal of fingers. The fingers are fixed by a spring, and can be removed with very little trouble in a few seconds without any tools, a new finger being replaced in a corresponding manner. Another feature of this controller is that it is arranged so that should one of the motors give trouble, it can be cut out by removing a few fingers and making a connection with a connector fitted to the controller in readiness for this purpose. The idea of this is to enable a driver to get the vehicle home with the other motor which is in a sound condition. A blow-out coil is fitted, and the controller has seven speeds, four with the motors in series, three with the motors in parallel, and an electric brake with four positions. The controller is somewhat similar to the standard tramway type, but is designed to meet the exact requirements of the Cedes-Stoll trolley vehicles.

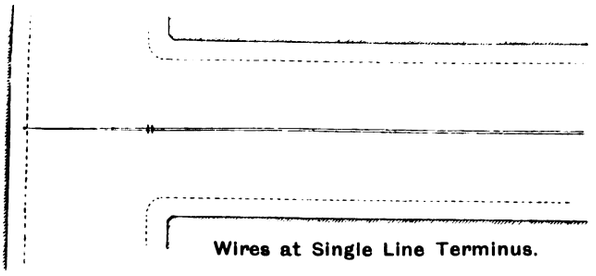
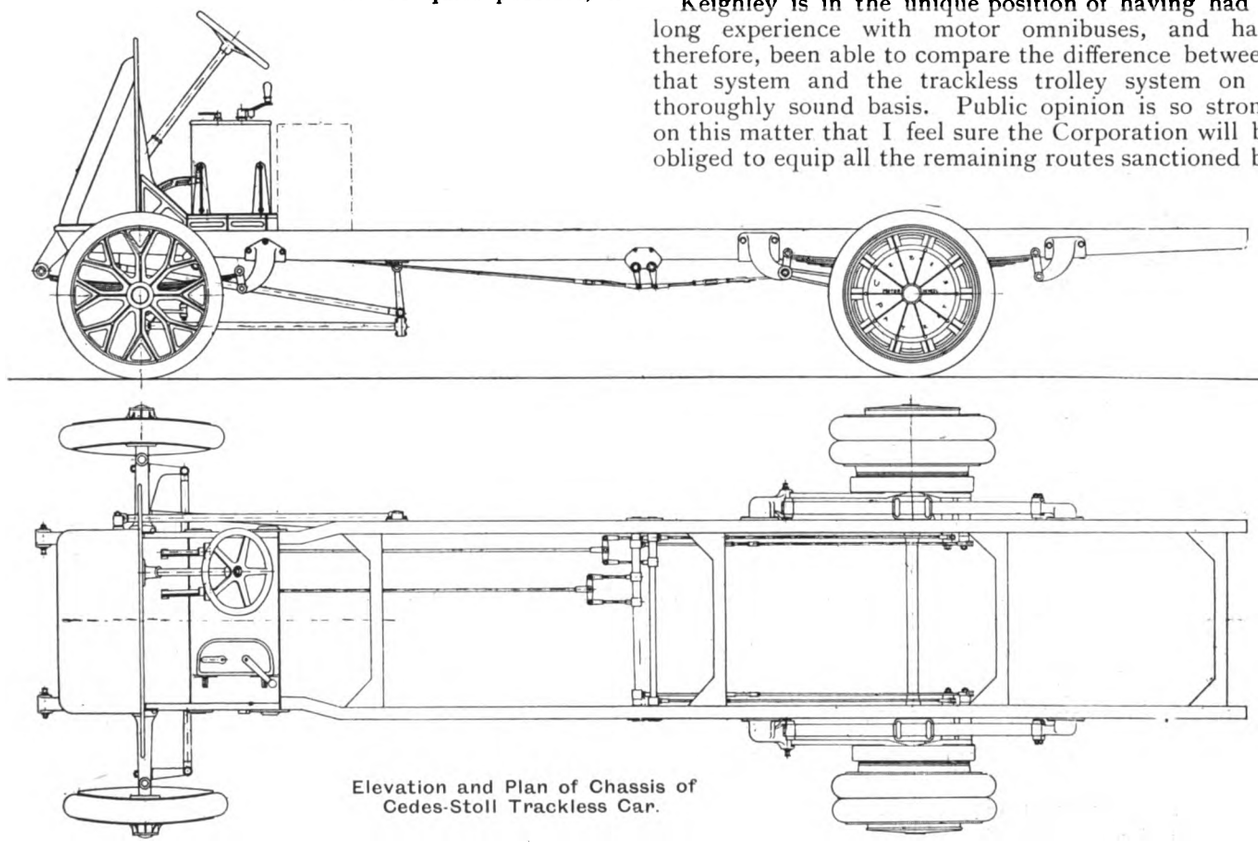
Several illustrations are shown of the actual vehicle in use at Keighley, together with some which give an idea of the overhead construction and method of current collection. It will be noticed that one of the illustrations shows a double-deck motor 'bus directly under the current collector, with two fairly tall men standing on the top deck, and yet leaving four or five feet clear head room below the pendulum, which keeps the little four-wheel carriage in its true position.



Wires at Single Line Terminus.

One of the other illustrations shows the simplicity with which the end of the line can be finished off without any circle, which is necessary with the under-running type of current collector in order to turn. In the other illustrations the vehicle is shown actually in motion.

I find that the best speed when going up hill, which is previously mentioned as 1 in 11 at places, seems to be about 8½ miles per hour, and it is, of course, not advisable to exceed this speed when coming down hill, but on the flat roads it would be quite possible, if desired, to reach 10 or 12 miles per hour without any detriment to the vehicles whatever.



Elevation and Plan of Chassis of Cedes-Stoll Trackless Car.

The following figures are claimed by the maker of the motors to be correct with a vehicle weighing 5 tons 4½ cwts.

1. Travelling on the level at 15½ miles per hour, 15 amperes at 500 volts would be consumed.
2. With a 5 per cent. gradient at 9½ miles per hour, 42 amperes at 500 volts would be consumed.
3. With a 10 per cent. gradient, travelling at 7½ miles per hour, 66 amperes at 500 volts would be consumed

The actual conditions in Keighley do not come exactly within any of these figures, but I find that when travelling at eight miles per hour, and allowing for stops on the road, and about 25 per cent. flat, that the actual electrical energy consumed averages 50 amperes at 500 volts.

At the present time we have had no necessity to cross an existing tramway trolley wire with an over-running system, but this is accomplished by a special fitting which allows for the two wires to pass above the tramway trolley wire, the tramway trolley wire being cut, and a small gap left between the two ends for the pendulum of the current collector and flexible wire to pass between. I have actually examined one of these fittings, and feel quite confident that they can be put into use with very little trouble.

In applying electrical energy for any power purposes, it is always desirable to get the motor direct on to the work, if possible, and in this respect the Cedes-Stoll hub motor wheel seems to be everything that can be desired.

In conclusion, the Visiting Committee, who were responsible for recommending the Cedes-Stoll system to the Keighley Corporation, have recently been inspecting other systems in actual operation, and I feel justified in saying that in each case every member of the committee came home again feeling quite satisfied with the system we have adopted.

I have endeavoured to write this article in a perfectly unbiased manner, and have only quoted actual facts as I have found them under practical every-day working conditions.

Keighley is in the unique position of having had a long experience with motor omnibuses, and has, therefore, been able to compare the difference between that system and the trackless trolley system on a thoroughly sound basis. Public opinion is so strong on this matter that I feel sure the Corporation will be obliged to equip all the remaining routes sanctioned by Parliament at the same time if they wish to avoid endless trouble with deputations from districts that are afraid of being left until the last.

Finally, it is a common human failing for every father to consider his own children the best, but in this case an opportunity has been given to the general public before deciding on the matter, and they have given their opinion strongly in favour of trackless trolleys as represented by the Cedes-Stoll system instead of the existing motor omnibuses.

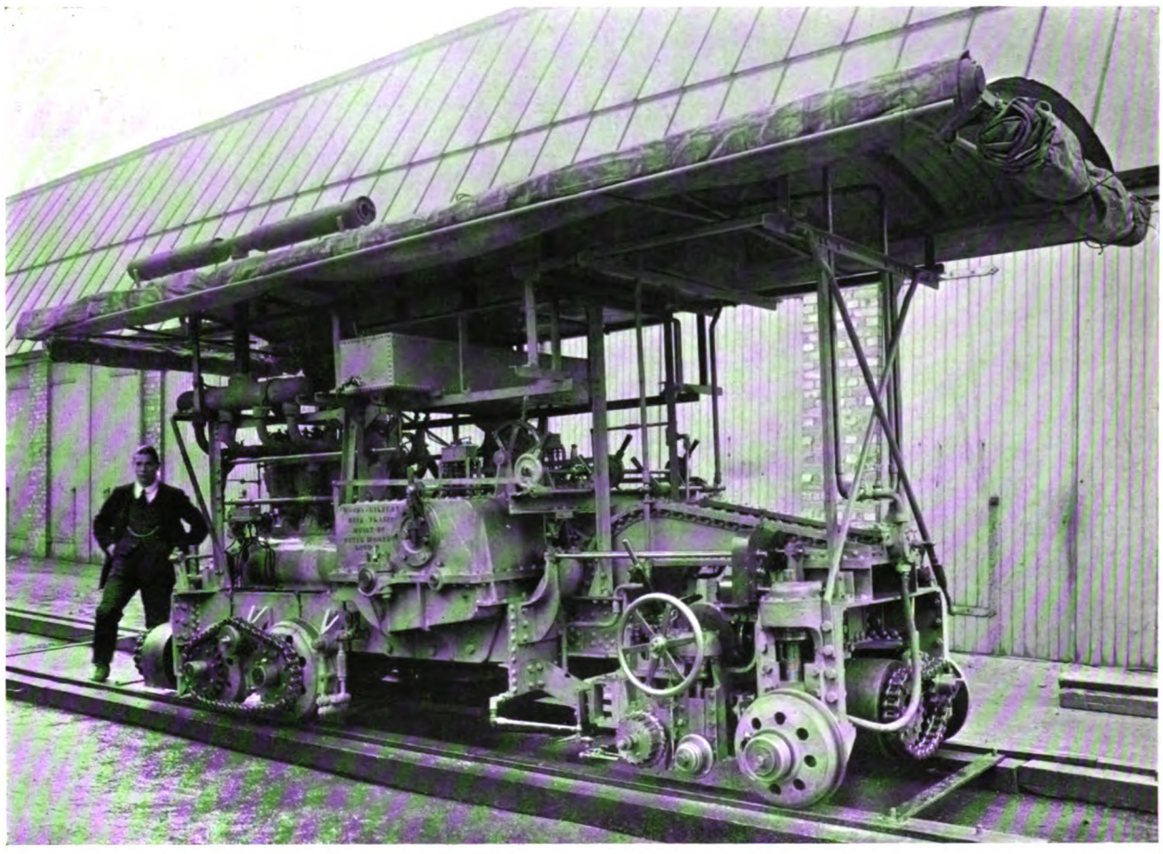
## RAIL-PLANING MACHINES.

PROLONGING THE LIFE OF RAILS.

At the present time, more than ever before in the history of electric tramways, the question of track maintenance, and particularly that of extending the life of rails, is of first importance. Most of the electric tramways in this country have now reached an age at which the extensive renewal of the tracks has become, or is on the point of becoming, a necessity, and the cost of this work is a very serious charge on the undertakings, already in many cases overburdened. Apart from the matter of corrugation on the rail tread, which may be removed by grinding, we have the trouble of the tread being worn down by the car wheels until the flange of the wheel bears on the bottom of the groove of the rail. This matter affects the tramway authority, but along with it is another which also affects the public, namely, the fact that the lip of the rail remains at about the original height, and thus forms an obstruction for general wheeled traffic. Then there is the further trouble of low joints, where fish-plate joints are used. It is also to be noticed that grinding for the purpose of removing corrugations without compensating deepening of the groove only hastens the day when the flange of the wheel will bear on the bottom of the groove. These troubles grow, until at length the tramway authority is obliged to pull up the track and lay new rails, at a cost of £2,000 or more per mile of single line. Various remedies have been proposed in the past, but none of them, with the exception of the welding of the joints, has come into use. Joint-welding is good in itself, but the whole length of the rail as well as the joints has to be taken into consideration. Given good substantial foundations to begin with, a new method of dealing with worn track is now available, which it is claimed adds 50 per cent. to the original life of the rails.

The essence of this method, which was first applied in Melbourne on the well-known cable tramways of that city, lies in two ingenious machines of the Woods-Gilbert Rail Planer Company. For some years this company have followed the requirements connected with the maintenance of tramway rails. They have succeeded in working out methods of remodelling the rails, which increase the life and remove corrugations and dishing at joints. A smooth-running track is obtained without any disturbance to rail or road-bed. The company have spent much money in constructing and perfecting their machines, and they have established a staff of engineers and mechanics specially skilled in the work. They are now in a position to enter into contracts with municipalities and tramway companies for the remodelling of rails. They also make preliminary investigations and submit proposals for carrying out the work.



Rail-Planing Machine for Re-Surfacing Worn Rails.

The remodelling of the rails, as already indicated, comprises the deepening of the groove, the cutting down of the guard lip, and the removal of the dish at joints and of corrugations. The work is performed by two different machines, a milling or cutting machine, and a surfacing or grinding machine. The function of the former is to deepen the groove and at the same time to cut down the projecting guard lip, thus giving on the average about 50 per cent. increased life to the rail beyond the ordinary period, and also minimising accidents to vehicles from the projecting lip. The milling machine is substantially constructed and of high-class material and workmanship. It is so accurately balanced and adjusted that it cuts out the rail groove to within $\frac{1}{64}$th of an inch of the standard depth under all conditions of track. This machine,

Digitized by Google

of which a view is given in the accompanying illustration, weighs up to 15 tons, and it cuts the groove and guard lip of both rails on the track at a speed of about 9,000 ft. per month when at continuous work. As to the grinding machine, its capacity for surfacing the rails also amounts to about 9,000 ft. of single track per month. This machine removes the corrugations and also the dish and irregularities at joints, leaving the rails after the grooves have been cut with a smooth and even running surface. Both of the machines have suitable undergearing to enable them to be run along tracks at any desired speed when they are not engaged in remodelling work. They are quickly removed from the track and housed at depots along the routes. The work is carried out at night after the cars have stopped running, and the tracks are left clear in the morning. Practical experience has shown that the best results are obtained if the work is carried out before the defects have reached too pronounced a stage. In addition to the saving in capital cost of renewals, further economies are represented in the reduced cost of track and car maintenance.

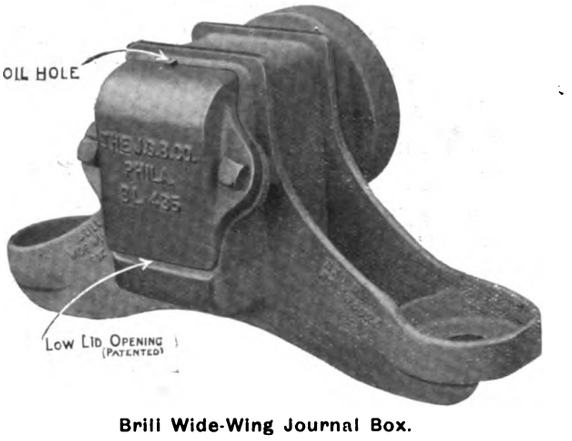
The mileage which has been remodelled up to the present is over 50 miles of single track. This includes work carried out on the Melbourne and the Brisbane tramways in Australia, together with the remodelling of the rails on the Oldham, Ashton, and Hyde tramways, in England. The machines were first put to practical work on the Melbourne tramways, and the highly satisfactory results established the soundness of the principle. In England the remodelling work at Ashton-under-Lyne has recently been in operation. Cardiff Town Council have passed a resolution recommending that part of their tramway tracks should be remodelled, and it is expected that the Woods-Gilbert Company will shortly start the work. A contract has been entered into for the remodelling of 200 miles of track in Sydney, New South Wales, and other lines are now under consideration.

Mr. G. S. Duncan, M.Inst.C.E., who carried out the construction of the Melbourne cable tramways, and has since been the consulting engineer of the Melbourne Tramway and Omnibus Company, was, we believe, the first tramway engineer to make use of the new method of rail reconstruction. On his advice the tramways company entered into a contract with the Woods-Gilbert Company for the resurfacing of 60 miles of rail. So satisfactory were the results that the contract was extended to cover 90 miles of rail. The contract stipulated that the cutting and reshaping of the rails should be carried out *in situ* and without damage to the tramway company's property, or to the public. Mr. Duncan acted as engineer in supervising the work, which he states was carried out to his complete satisfaction and to that of the tramway company and to the public. The chairman and managing director of the tramway company has also testified to the great improvement in the smoother running of the cars, and lessened expenditure on the cars and track for maintenance. In Brisbane a total of 6,775 ft. was cut out on the tread of the rail and 2,975 ft. in the groove. The tramway company find that the work has effected a very decided improvement in the comfort of the travelling public. It has also eliminated the hammering to which the cars were previously subjected. In Sydney the work of resurfacing the track is now being carried out by the Woods-Gilbert Company. The Oldham, Ashton, and Hyde Tramway Company are also well satisfied with what has been done on their tracks.

We may add that Mr. G. S. Duncan was so favourably impressed by the advantages and possibilities of the Woods-Gilbert system that he has been devoting considerable attention to the introduction of the new methods to tramway engineers and managers in this country. It is expected that a wide field of activity will be opened to the company as soon as it is understood that the new system offers a prospect of relief from the increasing burden of track maintenance and renewal. The process undoubtedly deserves the most thorough investigation, and we think it fortunate that its results can be inspected on a line so easily accessible as that of the Oldham, Ashton, and Hyde Tramway Company. The present offices of the Woods-Gilbert Rail Planer Company are at 32, Victoria Street, Westminster, S.W., where full particulars and estimates may be obtained.

## BRILL WIDE-WING JOURNAL BOX.

The illustration shows a journal box for single trucks, which has been recently placed on the market by the J. G. Brill Company. The outstanding feature of this new design is the construction of the lid opening, which is now brought down to a point considerably below the journal. In the old type of box with the high lid opening, it was impossible to get at the oiler in the box without jacking up the car and lifting the box off the journal. When hot-box and similar troubles occur, the car has now to be run back to the depôt before the oiler can be changed, causing loss of revenue while the car is out of service. With the Brill patented construction of lid all that is necessary is to swing the lid to one side; this exposes the oiler, which is then easily taken out by hand. Thus any oiler troubles can be instantly attended to on the road without putting the car out of service in any way, an improvement which will doubtless appeal to tramway managers.



**Brill Wide-Wing Journal Box.**

Another convenient arrangement that will be noted is the extra oil hole in the top of the lid for periodical or temporary oiling by merely unscrewing a plug in it, with very little loss of time.

This Brill wide-wing journal box is a registered design, and the low-lid opening above referred to is patented. The extended ears of this journal box have proved very successful in minimising end to end oscillation of cars, as it increases the lower spring base over 7 in. Another important point in connection with this wide-wing box is the effect it has in relieving sidebar stresses at the yokes. It is a lighter box than the old grey iron pattern, saving approximately 50 lb. per car, and being made in malleable iron is very nearly 12 per cent. stronger than the old pattern.

**Conveyance of Postmen.**—Contracts have been made with the Postmaster-General for the conveyance of postmen on the tramcars in Coventry and Southampton. In the former city the payment is £200 per annum, and the contract is for five years.

**Progress in Tramway Practice.**

Those departments of tramway work that are invisible to the public gaze afforded Mr. A. R. Fearnley, in his address from the chair at the Municipal Tramways Conference, more scope for congratulatory remarks than did the things that are visible. His chief reference to the latter was embodied in the remark that in those towns which were early in the field with electric traction, car bodies are already being redesigned and reconstructed, giving easier and safer access, covered top decks and increased carrying capacity. The more commodious platform mounted upon the radial truck, the improved bodies and means of entrance and exit with which the Liverpool Committee are experimenting, thanks to the inventive genius of their manager, and the double-deck car at Huddersfield that permits passengers to leave on the near side of the motorman's platform appear to constitute the only signs of progress for which British practice is responsible. Whenever a member of a tramway committee returns from a tour abroad and imparts his impressions to an interviewer, he invariably comments upon the greater facilities for speedy traffic afforded overseas by the single-deck cars. This advantage on the part of the Colonial car arises from the absence of the continuation of the dash board on the near side of the front platform, thus permitting that end to be used as the exit for passengers. Reference to the benefits of this system have often been made in these pages; and we have also pointed out that it is not a difficult matter so to arrange the staircases of a double-deck car as to permit of its institution here. It is one of the advantages that follow from the alterations of platform and staircase for the adoption of the payment-on-entry patents. If the Sheffield, Leeds, and Bradford managers, who are experimenting with the system of collecting top-deck fares on the platform, would arrange one or two cars for exit by the front end, they would probably find that much of the objection now raised to the practice would be obviated. The smoother working thereby ensured, the saving in running time, and the absence of two contending streams of humanity —one endeavouring to quit the car and the other to enter it—might lead them to follow the enterprise shown by Aberdeen and Leicester in experimenting with the prepayment system. There need be no fear of opposition being raised by the Board of Trade to a front platform exit, as a delegate suggested at the Conference. Huddersfield people are so pleased with the double-entrance car that they make it one of the show things for visitors. It is indisputable that the car economises time and almost entirely eliminates the risk of accident to passengers when alighting. The chairmen of the tramways committees of Leicester and Aberdeen are agreed in speaking of the beneficial effects of the prepayment system, especially with regard to the prevention of accidents. The managers of those undertakings who have adopted the method of collecting top-deck fares on entry could probably all confirm its value in that respect.

**Tramcar v. Omnibus.**

The subject which created the greatest interest at the Municipal Tramway Conference was the admirable and convincing paper by Mr. J. B. Hamilton dealing with the respective revenues and expenses from working tramways and motor omnibuses in large towns. Great was the disappointment that time would not allow longer discussion of the paper; so many members wished to speak that two or three hours more might have been profitably devoted to the subject. No attempt was made at

Digitized by Google

detailed criticism of the figures put forward by Mr. Hamilton, but these figures and his calculations were the essence of the paper. From the point of view of the case which he was making out the figures appear to be unassailable; suggested modification would be much more likely to make the position of the omnibus less favourable still than to have the reverse effect. Excluding London, which is a special case, it appears that for the 27 towns in this country which have a population of over 150,000 the average tramway working expenses, excluding rates and road repairs but including interest and sinking fund, amount to 9·167d. per car-mile. The sums spent on road maintenance by the tramways and the sums they pay in rates on the tracks are calculated out, and when added to the profits of the undertakings give a total credit return to the ratepayers of no less than £1,642,356. If motor omnibuses were substituted the results would be very different. Mr. Hamilton took the working expenses of omnibuses, including interest and sinking fund, at the very moderate figure of 10d. per mile run, and he gave the omnibus the benefit of supposing that it would earn 80 per cent. of the receipts of a tramcar. Even thus it was shown that instead of there being a benefit to the public of over a million and a half annually, there would be a loss of £2,556,441. In this column we can give only these few striking figures, but Mr. Hamilton's paper and his reply to the discussion will be found in this issue; they should be carefully studied. The paper works out systematically and completely the results likely to arise if the views of automobile visionaries were ever put into practice. Some members of the Conference very properly pointed out that tramway men must keep their eyes open for developments of any kind, and the benefits of the omnibus in certain circumstances were not overlooked; but nothing was said which would qualify Mr. Hamilton's main contention for the case of large towns. The only hostile criticism—if it can be so called—came from Mr. Worby Beaumont, the technical adviser to the Commissioner of Metropolitan Police. Even his remarks in favour of omnibuses were qualified by the admission that in some cases tramways afford the best means of local transport. His plea for general traffic, especially in narrow streets, has little weight when one remembers that for a given volume of traffic omnibuses would have to be twice as numerous as tramcars. He indicated that a different interpretation might be put on some of Mr. Hamilton's figures, but made no attempt to do so. Tramway managers at least will clearly support Mr. Hamilton's conviction that the era of rail transit for urban districts shows not the slightest sign of being superseded by any other form.

---

**Maintenance of Track Paving.**

No subject is at the present time of more importance to tramway owners than the incidence of cost for maintaining the surface of roads on which tramways are laid. Councillor Fenton's paper on the subject at the Sheffield Conference put the case very clearly and forcibly, and it elicited a useful discussion, which it may be hoped brought nearer the time when there will be a radical amendment of the archaic law that now impedes tramway development. The position may be considered from three points of view: that of the Corporation owning and working tramways on roads under their charge; the County Council working tramway lines on roads maintained by local authorities; and lines worked by companies on public roads. It was evident at the Conference that the differences which have hitherto militated against common action are gradually disappearing. Taking the first case quoted, it has been argued that if the tramways committee have to pay too much for their privileges they are at the same time relieving other departments which would otherwise, perhaps, show a loss in working. As was truly said at the meeting, municipalities ought to place their accounts on the most satisfactory financial basis possible, so that they would bear the keenest and healthiest criticism. For this purpose we venture to suggest that a standing committee be appointed by each Corporation to allocate the charges between the electricity, the highways, and the tramways committees. These standing committees might form the sort of municipal parliament suggested at the meeting. As a standard form of accounts has been adopted for the tramways, it would be advisable to have similar standards for the other departments. The figures thus obtained would be useful as forming a basis for the charges in the

Digitized by Google

two other cases. By applying the data on which such charges were estimated to the varying conditions and different towns, it would be a comparatively simple matter also to settle what the local authorities should charge the London County Council, and what private companies should be called upon to pay for the use of the roads. A mass of information would be acquired in course of time, which would strengthen the hands of those who object to the antiquated notion of making tramways pay for paving those parts of roads they neither use nor injure. The standing committees would come to the conclusion agreed to at the Conference, namely, that as compared with tramless highways the tracks are a decided advantage in every way, and should be called upon to pay but a very small proportion, if any, towards the upkeep of the roads on which they are laid. The two Tramway Associations working with the urban, the municipal corporations', and the county councils' associations, should be able "to take such steps as will result in general and more equitable legislation with regard to the question of road maintenance."

---

**The Wearing of Badges.**

In these days when trade unions have almost been perverted from their purpose by the propagation of pernicious doctrines, it is difficult to understand the frame of mind of men who wish to wear a badge in order to advertise their adherence to the various societies. The variety and number of these organisations connected with passenger transport by road vehicles suggests that some persons find them a profitable means of gaining a livelihood. Evidence of the length to which they will go in an effort to maintain a new organisation is to be seen at present in the fight of the Dublin employers against a man who, pleading that he has a "divine mission," has dragged other unions into the meshes of Syndicalism. Fortunately three circumstances have operated to prevent the Irish capital being handed over to the forces of anarchy, as was the case during the greater part of the five weeks when a Syndicalist movement initiated a general strike in Brisbane consequent upon the refusal of the tramways company to permit the wearing of badges. At Brisbane the agitators were allowed to force the fight after the company had suspended the badge wearers. In Dublin the specified grievances on the part of the employees were put forward by the man who endeavoured to hold up the Dublin service in order to secure recognition of himself. The courage of the chairman of the company, and the loyalty of the majority of the men—since recognised by a public subscription of nearly £1,000—encouraged other employers at last to resist the claims of the individual. Above all the Government have been firm in maintaining law and order, a virtue which was not apparent in the Brisbane case. There the refusal of the Federal Labour Government to send troops to assist the police, led to the agitators bringing business and the trade of the port to a standstill. Volunteer police had to be enrolled from various States before law and order gained the ascendancy. When the tramway men's claims were submitted to the Federal Arbitration Court the badge question was decided in their favour. London has just experienced a threat of having its omnibus service dislocated because of demands of a union organiser for the men to be allowed to wear his badge, and for himself, along with the company's chief officers, to constitute the final court of appeal in settling union men's grievances. Although only half of the employees are said to be members of the union, the employers averted trouble by agreeing to the requests, but it is satisfactory to note that the companies have laid down a stipulation that no employee is to be intimidated or interfered with in the discharge of his duties by any member of the union. It is in this matter that other trade unions, notably those connected with the coal and cotton workers, have lately shown an intolerance altogether foreign to the original intentions of trade unionism, and there are indications in two or three towns that the evil example is not lost upon some tramway unionists. The London County Council permit their tramway men to wear the badge, but it is the exception to see a man displaying it. Even the existence of Conciliation Boards does not prevent agitators raising a turmoil. This was shown by the commotion made last year in order to secure consideration for certain claims being given during instead of after the Council's vacation.

# Municipal Tramways Association.

## Twelfth Annual Conference held at Sheffield,

**September 23rd, 24th, 25th, and 26th.**

The twelfth annual Conference of the Municipal Tramways Association (Incorporated), which was held at Sheffield from September 23 to 26, has added another to the list of successful meetings that this youthful but vigorous organisation has so usefully carried out. Of the utility of these gatherings there can indeed be no question. Municipal tramway enterprise has become a department of public work so vital and important that its influence is felt throughout the country. With the exceptions of Dublin, Bristol, and Edinburgh, every large town now works its own tramways, while most of the smaller towns also have their own installations. The interests of these undertakings are in many respects identical, and it is essential that there should be some organisation, some central clearing house, where difficulties may be brought forward, problems stated, solutions discussed, and needed changes initiated. That the Association attains the objects for which it was formed has been repeatedly demonstrated. The standardisation of municipal tramway accounts, for instance, which has been of incalculable benefit to undertakings both large and small, would, it may safely be said, never have been accomplished without the aid of the Association. The immediate result of the Conferences may occasionally seem inadequate, but it cannot be denied that they give an impetus to progress in various departments of the work which could be obtained in no other way. Town Councillors, therefore, do well to support the Association, and to send their delegates regularly to its public and private conferences. Appreciation of the work of the Association has increased steadily, and it it gratifying to note that the meeting at Sheffield formed a record in point of attendance. The delegates numbered over 175, and they represented 72 Corporations and Councils. Two allied associations were also represented, viz., the Incorporated Municipal Electrical Association and the Tramways and Light Railways Association. Mr. Worby Beaumont, the genial protagonist of the motor omnibus, was also a welcome guest.

The Association was most hospitably entertained by the Lord Mayor and Corporation of Sheffield. Everything possible was done to make the delegates' stay in the City enjoyable, and to enable the work of the Conference to be carried on under the most pleasant conditions. The Town Hall was placed at the delegates' disposal, the meetings being held in the large and finely proportioned Council Chamber.

The first session of the Conference took place on the Wednesday, but many delegates arrived on Tuesday and attended an informal reception in the evening at the Victoria Station Hotel, where they were received by Mr. A. R. Fearnley, president of the Association, and Mrs. Fearnley. Much disappointment was expressed at the absence of the chairman, Sir Wm. Clegg, who was at Wiesbaden, but his place was taken by Councillor A. T. Bescoby, vice-chairman of the Tramways Committee, who was accompanied by Alderman J. Knowles and Councillors W. Bakewell and T. G. Evans. During the evening an enjoyable musical programme was rendered. The preliminary gathering thus pleasantly arranged by Mr. Fearnley, gave the delegates a much appreciated opportunity of meeting friends, and of discussing informally the various items of the Conference on which they were to enter on the following day.

On Wednesday morning the Conference was formally opened, and the delegates received a cordial welcome from the Lord Mayor of Sheffield (Alderman S. Osborn, J.P.), who alluded to the importance of the tramway system to the city of Sheffield. They had, he said, been fortunate in being served by two tramway managers who had proved themselves to be at the forefront of their profession. Of Mr. Fell's inauguration of their tramway undertaking they had the most grateful and pleasant recollection, and Mr. Fearnley, who succeeded him, had met the increasing demands and faced the increasing difficulties in a manner beyond all praise. He (the Lord Mayor) had only one regret in connection with the Congress, and that was the absence of the chairman of the Tramways Committee, Sir William Clegg, from whom he had received a letter, which he read to the Conference. In this Sir William extended a cordial welcome to the delegates, and expressed his regret at being unable to arrive in Sheffield in time to express to them personally his pleasure that the Association had elected Mr. Fearnley as president of the Association. Councillor A. T. Bescoby, vice-chairman of the Tramways Committee, supported the welcome extended by the Lord Mayor, and Alderman J. Miles, chairman of Bolton Tramways Committee, and Mr. A. L. C. Fell, chief officer of the London County Council Tramways, responded on behalf of the delegates.

Mr. A. R. Fearnley then read his presidential address, which was followed with close attention. Although, as he said, there had been no very striking developments since the last Conference, his address showed that the year during which he had presided over the work of the Association had been by no means uneventful. In touching upon various matters, the President gave evidence of a thorough knowledge of the problems that confront tramway owners in various parts of the country, and his comments are well worth the attention not only of members of the Association, but of all who take an interest in the questions of local transport. His summary of the position as respects the motor omnibus could hardly be bettered :

> "Good types of motor vehicles can be obtained. The carriage portion is, however, somewhat crude and ugly, and provides limited accommodation as compared with that to which tramway passengers are accustomed. There are very few roads in the provinces which are yet really suitable to such a vehicle. It is now probably more a problem of the road than of the vehicle."

While he saw little likelihood of the motor omnibus taking the place of the tramcar for heavy traffic, he

recognised the value of the omnibus as an adjunct to tramways. Sheffield had ordered 10 omnibuses, and they would no doubt need others. In this, as in other matters, Mr. Fearnley took statesmanlike views, and expressed them tersely and well.

A cordial vote of thanks having been given to the President for his address, Alderman S. Flint, chairman of Leicester Corporation Tramways Committee, read a paper on "Platform Fare Collection." This dealt with a subject about which much controversy has arisen, viz., the P-A-Y-E system, which was recently adopted for one route in Leicester. Alderman Flint's account of the success of that system is clear and emphatic. "Accidents from injuries through attempting to board or alight from cars when in motion are *nil*. Motormen and conductors are very much in favour of the system. Such objections as were at first made by passengers have now all been met." At the present time there is, in the author's opinion, "nothing to which any reasonable person could raise objection"—emphatic testimony which shows, at least, that the system must be carefully considered. In the discussion which followed, Councillor J. A. Smith, chairman, Aberdeen Tramways Committee, was equally positive of the benefits they had derived from the system. In fact, all of the speakers who had practical acquaintance with the new method spoke in high praise of it.

The afternoon was devoted to Councillor W. C. Fenton's paper on the "Maintenance of Paving on Tramways as Affected by Section 28 of the Tramways Act, 1870." The case for effective revision was fully established by the author, and he was strongly supported by Councillor C. F. Spencer, of Halifax, who opened the discussion. This was well maintained, with much animation and cogency; and if argument could affect the action of a Government indifferent to all but political matters, the tramway industry would not have to wait long for a new charter. The paper and discussion have, however, put the matter in a strong light, and it is scarcely possible that it will be allowed to remain in its present condition indefinitely. The sitting was continued until late in the afternoon, and subsequently the members inspected several railless omnibuses from Bradford and Rotherham, which were run on a short section of line specially erected for the occasion on a steep gradient not far from the Town Hall.

In the evening, at the invitation of the Sheffield Tramways Committee, the delegates attended a performance of "Kismet," at the Lyceum Theatre, a large part of the house being specially reserved for the party. Afterwards the Lord Mayor entertained the members and other guests at supper in the parlours of the Town Hall. The tables were handsomely decorated with flowers, and the rooms presented an attractive scene.

On Thursday morning the delegates assembled in force to hear Mr. J. B. Hamilton's paper on "Urban Passenger Transport." This was by common consent *the* paper of the Conference, and the members had looked forward to an important discussion. Unfortunately the time available proved far too short to enable more than a few of those who desired to speak to take part, and as a consequence much disappointment was felt. As treated by Mr. Hamilton, the topic resolved itself into the keenly debated question of motor omnibuses *v.* tramways. No one is, perhaps, better qualified to discuss this matter than the author. He has had a long experience of various forms of traction, including motor omnibuses, and is well-known to believe in the future of railless traction. He thus approached the subject without bias, and considered it strictly from the point of view of one desirous only to ascertain what methods are best adapted to urban service. Mr. Hamilton's study of the problem has led him to form one conviction which stands out clear and distinct in his mind, and that is that "the era of rail transit shows not the slightest sign of being superseded by any other form." Time, we think, will prove Mr. Hamilton's view to be as accurate as his review of the present position is broad-minded and able. He has conferred a great service on tramway owners, and we trust that his paper will be widely read.

On the adjournment of the Conference, the delegates and guests were again entertained at luncheon at the Victoria Station Hotel, by the Sheffield Tramways Committee, and later special cars and motor omnibuses took them to visit the works of Messrs. Edgar Allen and Co., Hadfield's Steel Foundry Co., and Messrs. S. Osborn and Co. (the Titan Trackwork Co.)

In the evening the annual dinner of the Association was held at the Victoria Station Hotel. Mr. Fearnley occupied the chair. A large company was present and among the guests were the Lord Mayor of Sheffield and the Lady Mayoress. A report of the proceedings is given in the following pages.

The Conference was concluded on Friday morning by the annual business meeting. As stated in our report, Alderman H. Linsley, chairman of Salford Tramways Committee, was elected president for the ensuing year, and Mr. Peter Fisher, general manager of Dundee Corporation Tramways, vice-president. Mr. C. J. Spencer, the popular honorary secretary and treasurer, was re-elected, and Mr. G. W. Holford, general manager of Salford Corporation Tramways, was elected a member of the Executive Council.

On the conclusion of the meeting, the members made an excursion to the Dukeries, thus terminating one of the most interesting and enjoyable Conferences that the Association has held. The arrangements throughout were admirably planned. Everything went with a ease and smoothness that testified to the care and forethought of capable organisers, and Mr. Fearnley and Mr. Spencer, upon whom fell the principal burden, and their assistants, received the cordial thanks and congratulations of the members.

**WEDNESDAY, SEPTEMBER 24.**

## THE OFFICIAL RECEPTION.

The first session of the Conference was convened in the Council Chamber of the Sheffield Town Hall, under the chairmanship of the President of the Association (Mr. A. R. Fearnley, general manager, Sheffield Tramways), on Wednesday, September 24, 1913, at 10-15 a.m. when the Lord Mayor of Sheffield, the Vice-Chairman, and members of the Sheffield Tramways Committee extended an official welcome to members of the Conference.

The Right Honourable The LORD MAYOR OF SHEFFIELD (Alderman S. Osborn, J.P.), who on rising to speak was received with loud applause, said: Mr. President and gentlemen,—I have the greatest pleasure, in the name of the City of Sheffield, and in particular on behalf of the Corporation, in extending to your Association a most cordial welcome to our city, and in expressing the earnest hope that your visit here will be one of the greatest possible pleasure and profit to yourselves, as we know it will be to us. We much appreciate the opportunity of welcoming such an august body as the society which is now assembled in this room. The only regret I think I have to express is at the absence of the chairman of our own Tramway Committee, Sir William Clegg. I will not say Sir William Clegg is undergoing a much needed course of treatment, but he is undergoing a well-deserved holiday at one of the health resorts on the Continent, and to Sir William Clegg this city is enormously indebted for the great success of its tramway undertaking. (Hear, hear.) I think I cannot do better than read to you a letter I have received from Sir William Clegg; it is dated September 19 at Wiesbaden. He says:

"My dear Lord Mayor,

I am sorry to find that I shall not be able to arrive in Sheffield in time to join you in extending a most cordial welcome to the members of the Tramway Association on the occasion of their honouring the city by holding its Annual Conference in Sheffield.

I am the more sorry for this as Mr. Fearnley is the President, and I should have liked to have personally voiced my expression of pleasure to the Association for electing him to that position. They have shown that they have appreciated the service he has rendered to it in his capacity as Secretary and as Vice-President almost as much as I appreciate the service Mr. Fearnley has rendered to me and the tramway undertaking. But I know that you and my colleagues on the Committee will do all that is necessary to make the Association's visit not only a pleasurable but a profitable and educational one, in the interests of tramway undertakings.

I am one of those who do not altogether look with a friendly eye on conferences as a rule, as I am very much afraid they indulge in too much pleasure with a minimum of educational cultivation, but I know from personal knowledge and observation that such is not the case with the Tramways Association.

Will you kindly express my renewed regrets at my inability to be present, and the hope that in every respect the Conference will be the most successful of all its predecessors, and that the delegates and their friends will have reason to remember their visit to Sheffield with much pleasure and gratification.

With kind regards,

Yours faithfully,

(Sd.) WM. E. CLEGG."

We in the city of Sheffield realise the civic importance of this gathering, representative of tramways in all large areas, especially those which are thickly populated. From whatever point of view one regards a tramway undertaking, it seems to me to be an advantage. Particularly in our own instance, I think, has it helped more than anything else to solve what might have been—especially in this time of increasing population and the boom in trade—a very serious problem of housing. The cheap transit by them from one residence to another, and from the men's and from everyone's residence to his daily occupation, has done a great deal to relieve the pressure we should otherwise have been feeling in this time of trade boom.

We welcome your profession here because you embrace a Society whose members have to have, not only an extensive but a very particular knowledge of all branches of engineering, from ordinary mechanical to electrical and civil. You also have to be expert financiers, and you have to be commercial men of the very first grade.

Sheffield has been fortunate in being served by two tramway managers—men who have proved themselves to be at the forefront of their profession. (Hear, hear.) Of Mr. Fell's inauguration of the tramway undertaking we have the most grateful and pleasant recollections in Sheffield, and now Mr. Fearnley has succeeded him, and not only maintained the good work he inherited, but met the increasing demands and faced the increasing difficulties, which from time to time have been placed upon him, in a manner beyond all praise. (Hear, hear.) It is not often we have the privilege of expressing our appreciation of the work done by our public servants, and I have the greatest possible pleasure and confidence in saying that we have one—and not the only official in charge of a responsible department of this city—who carries the fullest confidence and respect of every member of the body corporate. (Applause.)

But, of course, a manager is powerless unless he has a loyal staff and Mr. Fearnley and his predecessor have been supported by most loyal and capable staffs. The success of our undertaking could only have been reached—and I suppose the same obtains in all cities—by such hearty and complete co-operation, and we tender on this occasion our sense of gratitude to every member and every servant of the Corporation Tramways Department who has realised that he has a public duty as well as that he is earning his own livelihood. Well gentlemen, we welcome you here, and all sections of the community welcome you. I think one may say, not only does the commercial community welcome you, but the humblest denizen of this city also welcomes you. Those of us who are interested in commerce have a lively sense of the commercial interest Sheffield has in tramway undertakings. We are conscious of the fact that our city, from the beginning of the great tramway development, has taken a foremost place in the supply of tramway appliances, and we have every reason to believe that Sheffield will maintain that position, and increase its reputation and facilities for meeting your requirements. May I say too that the humbler citizens, the working men of Sheffield, also appreciate the services rendered by such gentlemen as yourselves.

The relations between the Tramway Committee and their servants in Sheffield, I think I may say, have always been friendly. There have been times of difficulty, and quite recently we seem to have passed through a critical period, but I am glad to say there are signs of its disappearing through the goodwill and the sensible way in which the problem has been looked at by both sides. I am very glad that amongst the many things Mr. Fearnley can show you, he has not to show you how to manipulate a tramway strike, and I hope that will be an art he will never have the occasion of learning to exercise. (Hear, hear.) Now, gentlemen, I conclude by repeating my first words of welcome, and I earnestly hope that your meetings here will have the greatest possible success and prosperity. (Loud applause.)

Councillor A. T. BESCOBY (vice-chairman, Sheffield Tramways Committee): My Lord Mayor, Mr. President, and gentlemen,—In the absence of Sir William Clegg, the chairman of the Tramways Committee, I desire as deputy-chairman to take the opportunity of supporting the welcome which the Lord Mayor has extended to you as delegates of an important Association, which is charged with looking after the interests of municipalities in their tramway and omnibus work. This is your first visit to Sheffield, and we as a committee intend to make your visit a social and pleasant one in every possible way. We are delighted you have accepted the invitation in such good numbers, and to know that interest in the work of the Association tends to increase each year. The city of Sheffield, and some of its industries and works, are well known to a number of the delegates present who have found it necessary from time to time to visit those works to inspect material ordered for use on their tramways. To those who do not know the city it will be interesting to find that, in addition to the huge industrial side, there is also another side which contains beautiful and interesting country, some of which it is hoped will be shown to the ladies who have accompanied the delegates to the Conference when they pay their visit to Haddon Hall, and take tea with the Lady Mayoress at Grindleford to-morrow afternoon. During the Conference we shall have further opportunities of adding to the information already placed in your hands regarding our municipal tramways, in which the citizens take a great interest, and the successful working of which is a source of gratification to the members of our Tramways Committee. We are pleased that, owing to our general manager holding the position of President of the Association, we have had the opportunity of inviting you to our city. To all the delegates we extend a hearty welcome, and I trust we shall have a very successful Conference. (Hear, hear.)

Now, as our chairman, Sir William Clegg, is not present here to-day, I wish to tell you that he has been very interested in the gathering of this Conference here to-day. Before he went away, it was his wish that we should give every delegate present a real Yorkshire welcome—a Sheffield welcome—and all that lay in his power to do he has done to make this Congress a success. You are all tramway men and experts, and I do not know that I can show you anything new in the city of Sheffield, but we, the Tramway Committee and the inhabitants of this city, are proud of our Sheffield tramways. We can show you perhaps one useful thing; that is how to run three or four miles for the universal penny fare, and I dare say you will find many other things interesting in this our city. We think that our tramways are one of the best, and the best regulated in this country of ours. (Hear, hear.) We think they are thoroughly up-to-date, and we are going to keep them so, and follow any improvements made by the larger cities of this country, if they can show us anything we have to learn or benefit by. Now, gentlemen, the Tramways Committee give you a very hearty welcome here to-day. We are pleased to see you all, and I hope you will go away with pleasant memories of the city of Sheffield. (Applause.)

Alderman J. MILES (chairman, Bolton Tramways Committee): Mr. President,—I have been charged with a very important and delightful duty; it is to move that the best thanks of the Municipal Tramways Association be extended to the Right Hon. the Lord Mayor of Sheffield, the chairman and vice-chairman of the Tramways Committee, and the Committee itself, for the very cordial welcome extended to the delegates present this morning. You will all realise quite well that for a gentleman with the multifarious duties of the Lord Mayor of a city like Sheffield to come here and give us the kindly welcome he has done is a very great act of kindness, and I am sure we all appreciate it very highly indeed. (Hear, hear.) We all hope and believe that this Conference is going to be one of the very best we have had, and to know that the Tramways Committee and the Corporation generally are doing their best to make it so gives us much pleasure. We are very pleased indeed to hear from the vice-chairman of the wonderful success, the admirable management, and the splendid organisation of the Tramways Committee here. I am not going to occupy time—there is a good deal of work to be done this morning—but I do earnestly hope you will give this resolution more than an ordinarily hearty reception. I am sure you will do that, and that we all hope that the great city of Sheffield, with its wonderful organisation and wonderful industries, may prosper, and be as prosperous as we believe it is to-day for a great number of years to come. I therefore conclude with the resolution I have moved, and I ask for it a very hearty welcome from you. (Loud applause.)

Mr. A. L. C. FELL (chief officer, London County Council Tramways): My Lord Mayor and gentlemen,—I have very great pleasure in seconding this resolution of thanks to you for the very kind manner in which you have received the delegates to this Congress. I have also to thank you personally for your very kind reference to my small services

Sheffield Town Hall.

in Sheffield. I spent something like seven years in Sheffield, and they were certainly seven years of fairly hard labour, but it was a labour of love, and I feel very happy to-day to come back and find the tramways which I had the honour of installing still running, and running so efficiently under the splendid management of your Mr. Fearnley. I think it is a splendid thing to have a Tramway Conference in a city like Sheffield, where you have practically tried everything that can be tried in the tramway world. You have now filtered things out, so that you have the very best, and I think we have very much to learn here, and the delegates will find it worth while to study the Sheffield tramway undertaking. I thank you very much on behalf of the delegates for your very kind reception. (Applause.)

The vote having been carried with the greatest enthusiasm,

The LORD MAYOR OF SHEFFIELD said: Alderman Miles, Mr. Fell, and gentlemen,—I am very much obliged for the kind things you have said. All I can do is to repeat and emphasise the sincerity and heartiness of our welcome, and assure you that Sheffield's motto is always to go for the best and have the best; and while we hope that you will have more successful gatherings in the future than this one will be to-day, we hope that as far as it goes it will prove to be the best up-to-date. I thank you again, gentlemen. (Applause.)

The PRESIDENT: Now, gentlemen, having so successfully got through the pleasant opening of our Congress, I am compelled to inflict upon you what is called the Annual Presidential Address. I have tried to see that it should not be of undue length, and I trust you will bear with me for a few minutes while I read it.

## PRESIDENTIAL ADDRESS.

BY A. R. FEARNLEY

*(General Manager, Sheffield Corporation Tramways).*

Although it cannot be said that there have been any striking developments in the tramway world since our last Conference, yet important matters have come up for decision or review in tramway operation. In a number of directions, steady improvement and progress have taken place, and your Association has continued to take a keen interest in all these movements and developments, and to watch over the interests of the municipalities in this portion of their work.

Municipal tramways, at any rate, are not marking time in any way, and no better proof of this could be given than the applications to Parliament for Provisional Orders which have been made during the past year to extend tramways and to obtain additional powers in other directions connected with passenger traffic. Nineteen such applications were deposited in Parliament by municipalities at the beginning of the year, relating wholly to or containing clauses as to tramways, motor 'buses, or railless traction powers.

In actual tramway operation, improvements are constantly being brought about. There is a tendency on all our systems to improve "running time" as we term it, and (if the Sheffield system is a fair sample of what is going on in other municipalities) large sums are being spent in removing small equipments with which cars were fitted 12 or 14 years ago, and replacing them with equipments double the size and of an improved type—the interpole motors having proved a success and now being generally adopted as more capable of coping with the heavier traffic requirements of to-day.

In those towns which were early in the field with electric traction, car bodies are already being re-designed and re-constructed, giving easier and safer access, covered top decks and increased carrying capacity. Speeds are gradually being increased, with the consequent result that calls have been made upon the power house and permanent way branches of the department earlier than they would have been under the old condition of things.

As a result of the experience gained, better work is being put into tramway tracks to-day than at any time previously in the history of the undertakings—it being particularly noticeable in connection with this work that the mechanical joint is rapidly becoming obsolete, and welded joints, either electrical, "Thermit," or cast, being almost universally adopted.

The idea of isolating the tramway power house from the other supply stations in the district is, in consequence of the experience gained in many different parts of the country, now being abandoned, and in this city we hope before the end of the year to have completed arrangements by which any of the three power houses will be available for tramway supply in case of heavy load and at other necessary times. In other words, the plant which is being used during five-and-a-half days in the week to supply power to the large works in the east end of the city, will be available for our week-end, bank holiday, and football traffic. The arrangement promises to work out in an economical manner for both the Tramway and Electric Supply Departments, is in the best interests of the city as a whole, and is certainly a necessary insurance for the continuity of the electric supply service of the city.

All these improvements mean that large sums are being spent on renewals, and also that some additions are being made to capital account. In addition, demands for more frequent services have to be met, with a consequent tendency to bring about such a reduction in receipts per car-mile that final results only leave small margins per mile between total expenses and total receipts, which small margins, however, when multiplied by the ever-increasing number of car-miles run, produce what are in most towns—all conditions considered—undoubtedly satisfactory results.

The hours of labour and rates of wages of employees are steadily, but regularly, being improved in most of the municipal undertakings in the country, and the example set by the municipal tramway undertakings has undoubtedly influenced many other employments.

Despite the cost of these extra payments and expenses, working costs are being kept at a very moderate figure, and we find ourselves in the happy position of being able to provide, on our municipal tramways in Great Britain, what are, I believe, cheaper passenger transport facilities than are to be found elsewhere.

There appears to be growing up amongst the larger towns a keen and, I believe, a healthy rivalry as to which town shall give the cheapest rides, and in England, at any rate, the tendency appears to be to gradually increase the length of the penny stage to distances which a few years back were thought impossible, and in those towns where this policy has been pursued for some length of time it can be said with certainty that, so far as financial results are concerned, and also in what is of more importance, so far as the interests of the municipality as a whole are concerned, the policy is sound.

The distance of the penny stage is playing a more important part in the development of municipal areas than many people, including those who are closely connected with municipal work, have any idea of, and

Digitized by Google

I venture the opinion that it is one of the most valuable assets of all large towns to be able to transport their passengers a distance of three miles from the centre for a penny, and that very wide benefits are and will be derived from a policy of this description.

It certainly cannot be said of the tramways, as has been said of the railways since the publication of the 1912 railway report, that their development is at a standstill. In 1912 it is stated that the whole of the railways of this country only added 24 miles to their tracks, and, further, that in 1912 they carried nearly 32,000,000 fewer passengers than in the previous year, which is stated to be one of the most extraordinary facts ever recorded in British industrial development.

Compared with the tramway figures, where the passengers carried for the 12 months dealt with in the last Board of Trade return show an increase of 220,000,000 tramway passengers on the previous year, the figures are very significant.

The cause of the railway decline in the best years of trade which have ever been known is, I should say, the result of their policy of increasing fares together with the tramway, motor car, and motor 'bus facilities, now so largely made use of, and it is safe to assume that this competition will go on and be more keenly felt year by year. For some reason or other the electrification of English railways makes little progress, or we should probably have cause to take a closer interest in their suburban traffic than we do at the present time.

In some respects, for a number of our important tramway undertakings, 1912-13 has proved a year which will be remembered for a long time as an important one in the history of their undertaking, and all our tramways have been concerned, to a certain extent at least, in these matters.

The decision of Parliament on the London County Council (Tramways and Improvements) Bill, 1913, and the reversal of the Parliamentary Committee's decision in regard to compulsory running powers—a very unusual procedure — was a notable victory for the County Council, and may be useful to many of us on future occasions.

The decision of the Lords of Appeal on the rating of tramways was a disappointment, and means a reversion to the previous heavy charge that was made upon us each year for the rating of our systems. To the Sheffield tramways the decision meant an extra charge of £4,200 per annum, we having taken advantage of the decision of the Court of Appeal and obtained a reduction in our rates from that time.

The report of the Select Committee on Motor Traffic, which was awaited with much interest in the tramway and motor 'bus world, has been duly published, and appears to assist in many ways the demand for equality of treatment for which we, as tramway owners and operators, are now asking, and, I believe, intend to persist in asking for until some alteration is made.

Mr. A. R. Fearnley.

It appears clear from the report that if this traffic had been under municipal control the necessity for the Select Committee's appointment would, I venture to say, never have arisen. In other words, as Sir Lawrence Gomme indicated, the serious difficulties have arisen from the results of competition rather than organisation. It would not have been putting the case too strongly to have said—in many cases the result of senseless competition.

The answer of the Chief Commissioner of the Metropolitan Police to the question as to whether he would be in favour of power to divert traffic from one route to another, or to regulate the routes of motor omnibuses, being laid upon some authority, was very significant. The Chief Commissioner intimates by his answer that this is really a municipal duty, and could be best carried out by some such authority. The lesson to all provincial municipalities is clear—whether the street traction be tramways, 'buses, or trolley vehicles—they must do the work themselves, and thus ensure a service which they can control in every way. The essentials on which the committee agree are definitely stated. Summarised, they mean control by a Government department in consultation with local authorities.

Whatever the opinion may be regarding Board of Trade supervision, I believe municipal tramway operators will agree with me when I say that for the last few years, at any rate, the Board has adopted a broad and wise policy in connection with its tramway work, and has consulted and discussed with the representative associations alterations and innovations which have been necessary, and that the result of this method has been of advantage to everybody concerned. Having dealt somewhat briefly with what might be termed the current topics of the traction world, I should like us to consider the immediate outlook which as tramway operators is of paramount importance to us at the present time.

Electric tramways, in the accepted order of things should have, by this time, got through about half their life, that is, taking the life of their predecessors—the horse tramways and the steam tramways as guides—and many people appear to have made up their minds already that electric street traction is going to have no longer life than either the horse or steam tramway systems enjoyed. If the motor enthusiasts are any guide, electric tramways are going to have a somewhat shorter life than either of their predecessors. If some sections of the daily and weekly press are to be believed, the day of trams is already over and has been so announced in heavy type. Our conclusions on this matter will no doubt be assisted and guided by the paper which Mr. Hamilton is to contribute, and the discussion which is to take place at our Conference proceedings to-morrow. It is quite clear that whatever the results of present developments may be, the leading municipalities, at any rate, intend still to control the systems of traction, and it remains for us to see that our sinking funds are in such a healthy condition that we are in a position to take advantage of any change that may be found to be advisable. The 30-year loan periods which were granted when powers were obtained in the early days to construct our tramways may not after all turn out to be the advantage which at that time we considered them, seeing that in many cases all the available balances are used for other than tramway purposes.

During the past session in Parliament a considerable number of municipal authorities have obtained powers to work motor traffic, and my remarks on this subject are chiefly referring to the motor 'bus. The leading exponents of the trackless trolley system of traction are however, with us to-day, and examples of different types of vehicles are, by the kindness of our friends the tramways committees and general managers of Bradford and Rotherham, to be seen working on a short length of our tramway route, and will, I trust, be inspected by all our visitors. This innovation has enabled us to place at your disposal all the three modern systems of passenger transport, and the thanks of the Association are due to our neighbours for their valued assistance.

I recognise that the question of the motor 'bus is the one that is, next to our own business, looming largest in the minds of most tramway operators in the country, whether municipally or company controlled. No excuse is, therefore, needed for making this question one of the important matters for consideration at our Conference. It is a question of many phases. To some members it is a question of unfair competition with the tramways, and perhaps for the moment only, that is the most serious phase of it, and I trust the consideration which our business meeting is to give to the matter on Friday morning will be of some service to our friends.

There will, I am sure, be unanimity in accepting and supporting the resolution put forward by the Croydon and other borough councils in the Metropolitan area on this matter and which reads as follows:

"With reference to the motor omnibus traffic in the borough, the Committee recommend that the Government be urged to pass such

Digitized by Google

legislation as will place motor omnibus companies on terms of equality with regard to public obligations with the municipal tramways authorities in the Metropolitan area, and that a communication be addressed to the Prime Minister, the President of the Board of Trade, and the Member for the Borough, on the subject."

To a number of municipalities it is either a question of extension of their tramways or substitution by the motor vehicle or trolley car, and this is undoubtedly the most interesting problem for the provinces. In this case it may be simply a question of the type of vehicle.

Then there is the all-important question of THE ROAD, its construction and maintenance. And further, and probably the most important, the question of tramway renewals where it has to be decided whether the tramway shall be relaid or motor or trolley 'bus substituted, it being remembered that our present renewals are intended to serve us for the next 12 to 15 years.

If I summarised my personal views on this matter I would say:

That there are good types of motor and trolley vehicles to be obtained, the carriage portion of which, however, is somewhat crude and ugly, and follows much too closely upon the lines of the old horse 'bus, and provides very limited accommodation when compared with that to which tramway passengers are now accustomed.

That there are very few roads in the provinces which are really suitable yet for such a vehicle, and that it is now more a problem of the road than the vehicle, and our friends the surveyors who have charge of the streets and highways are undoubtedly going to have their turn in the limelight.

On the other hand, there is a large mileage of tramway permanent way which requires, or will shortly require, renewal. Here, then, is an opportunity for some authority to make an interesting and valuable experiment by taking an existing tramway route, the traffic results of which are well known, and deciding that the tramway service on this route should at least experimentally, if not permanently, be withdrawn and a suitable road surface be laid down and motor 'buses or trolley vehicles substituted for the cars.

There would be some advantages to the residents in the district selected, such as:

A quiet running vehicle;

The entire absence of the tramway rail;

The probability of a more frequent service, but with less saloon or covered accommodation;

The opportunity for the road authority to provide an ideal surface for modern forms of traffic.

If the motor or trolley vehicle is anything approaching in its completeness, reliability, and capacity the claims put forward by its advocates, what hesitation need there be in adopting such a course? It is quite true, and I presume has been remembered by its advocates, that it would cut down the available comfortable accommodation for over six months in the year to one third the present accommodation if a similar service and a similar number of vehicles as is already provided by the tramways was substituted. The total working expenses should certainly not be more than total tramway costs, which figure, however, would not include any allowance for road maintenance over and above the petrol tax of 1½d. per gallon, so that if the routes are outside the city or borough boundaries, this figure would need adding on, at any rate, until the question of contribution to road maintenance is finally settled. There is no difficulty in obtaining contracts for tyre maintenance from first-class firms at one penny (or less) per 'bus mile, and instead of motor spirit being more expensive, as was anticipated would be the case some little time ago, the present indications are that before very long there will be a drop in price, so that 'buses may be worked at an even lower figure than they are to-day, and so far as electrically-propelled vehicles are concerned electric power promises to have the same tendency.

We must try and keep an open mind when considering this question. Some of us are able to compare the present modern and efficient electric tramcar (without attempting to belittle the efforts of the people who were then engaged on the pioneer work of electric traction) with the experimental cars that we saw struggling up the incline in Cheapside, Bradford, some 23 years ago.

Although, so far as I can see at present, there is little likelihood of the motor 'bus taking the place of the tramcar for heavy traffic, it must be remembered that great improvements are likely to be made in the efficiency of the present vehicles. I do not suppose for a moment that we shall continue very long using a gallon of petrol per 7½ miles' run, and if this figure could be increased so that it compared in a reasonable way with the cost of electric power per passenger carried, and home produced motor spirit, free of duty obtained, considerable impetus would be given to the adoption of the motor 'bus in the provinces.

I would here say that I cannot understand the hesitation of the London 'bus companies in declining to give publicity to the details of their working expenses, and it will be of great advantage to us all when reliable figures are published in detail under the standard form of tramway accounts, as I anticipate they will be early next year by quite a number of our municipal tramway departments.

Whether the method suggested for dealing with the subject is adopted or not, I believe that it is most advisable for all our tramway systems to make some experiments with the 'bus, and if the Sheffield experience is any criterion there need be no hesitation in doing this, even if the 'buses are used only as feeders to the tramways, as it is found that such an arrangement works out very satisfactorily, and the experience is useful in every way.

The Sheffield Tramways Committee ordered ten 'buses and we have been working regular services since the beginning of February last. The 'buses are at work on four routes, and a fifth route is to be opened next month. The vehicles have proved reliable in service, and have now run over 100,000 miles. In two instances they have been taken out into the country districts, three miles from our tramway routes, and in both these cases the traffic has been very heavy, especially on fine days and during week ends. If reasonable use can be made of the vehicles during the winter months there is no doubt that next summer we shall require a much larger number of 'buses, and that we shall have need to go still further afield in order to meet the requirements of our passengers. If any members of the Conference or any municipality require information on the working of these vehicles, I am quite sure my committee will in a very short time be willing to place all the available information at their disposal.

Of course, before adopting such a change, trackless trolley cars—which one supercilious person describes as those crosses between tramcars and motor omnibuses which retain none of the best points of either parent—must have the serious consideration which they undoubtedly deserve, and there is now ample reliable experience and data to be obtained on the working of the trackless trolley system.

In our Conference arrangements it will be noticed that this year we have been able to reverse the usual procedure, owing to our success in obtaining two committee representatives in Mr. Councillor Fenton and Mr. Alderman Flint to read papers at our Conference, and these gentlemen, along with Mr. Hamilton, have selected subjects which are being keenly discussed in the tramway world, and their opinions and discussions will, I am sure, prove of assistance to us in our work.

Also we have with us some gentlemen who have had the opportunity of travelling and examining tramway systems abroad since our last meeting, and I trust we shall have the advantage of hearing their views on the subjects raised by the papers.

We have also with us more than the usual number of visitors, whom we are delighted to see, and we shall be intensely pleased if these gentlemen will honour the Conference with their views on the matters that are to be discussed.

It now only remains for me to support the welcome which has been given to you by the Lord Mayor and the Chairman of our Tramways Committee, and to express the hope that we shall have a successful Conference and that our deliberations will be of interest and useful both to the delegates and municipalities they represent.

---

Councillor J. H. ROGERS (chairman, Newcastle Tramways Committee): My Lord Mayor,—In the first place, I should like to congratulate you, sir, on having such a successful Conference in your city of Sheffield this year. Of course, under the presidency of Mr. Fearnley, one could not expect any other than that the tramway world throughout the country would rally round him, and give him an exceedingly good Conference in Sheffield, where we all look for our lead on tramway matters. I have risen, my Lord Mayor, to move a vote of thanks to Mr. Fearnley for his excellent address this morning. (Hear, hear.) If that address had been open for discussion, one might have said a lot of things—(laughter)—and got a lot of information; but it is a lead to tramway undertakings throughout the country. This *resumé* of the questions that are before the tramway world at the present time is opportune and excellent. We must not stand still; we must keep alive and progress with the times. Whether progression is by adopting trackless trolleys, motor 'buses, or any other motor power that comes out, I think we ought to keep awake to developments, and our President has tried to emphasise that fact in bringing these matters before us to-day. I also like the idea of impressing upon members present the need of looking after their sinking fund and reserve fund, and the life of the lines and so on. It is always well to keep that in front of every municipality. Now, we have some very interesting papers, and the questions Mr. Fearnley, our president, has introduced in his speech we will probably have the satisfaction of talking to some other experts about—Mr. Flint and Mr. Hamilton especially. Therefore, there is no need to enlarge upon what has been said by Mr. Fearnley, but I do with the utmost heartiness propose that the best thanks of this Conference be given to Mr. Fearnley for his able and excellent address. (Applause.)

Mr. J. ALDWORTH (general manager, Nottingham Corporation Tramways): I rise with very much pleasure to second the vote of thanks proposed by Mr. Rodgers. I am sure all he has said in reference to Mr. Fearnley's presidential address was well deserved. It is an address we cannot appreciate thoroughly in reading it through this morning; we have to take it home and consider it at our leisure, and I am sure we shall appreciate it far more when we have time to consider it more. (Hear, hear.) I have much pleasure in seconding the vote of thanks.

Digitized by Google

The vote was carried by acclamation.

The PRESIDENT: I am exceedingly obliged to you for the very kind way in which you have received my remarks, and the vote of thanks which has now been passed. As you are aware, we have quite a good programme and a lot of business to get through. I propose now to commence our real business by calling upon Mr. Alderman Flint to read his paper.

---

Alderman S. FLINT (chairman, Leicester Corporation Tramways Committee): Mr. President and gentlemen,—Before reading this paper I should like to admit at once that my apologies are due to the Conference on many grounds, but I may be permitted perhaps to say that after the paper was written a new name was suggested, in order that an opportunity might be given to the Conference for an adequate discussion on the pay-as-you-enter system. That involved a little chopping and changing, and may account in some degree for the imperfections of the paper.

---

# ADVANTAGES AND DISADVANTAGES OF PLATFORM FARE COLLECTION.

BY ALDERMAN S. FLINT

*(Chairman, Leicester Corporation Tramways Committee).*

The Leicester Corporation Tramways, having a central terminus in the very heart of the town, specially adapts itself to a simple system of fares, viz., a universal penny fare from the centre of the town to the various termini.

### FARE BOX SYSTEM.

When the undertaking was acquired from the Leicester Tramway Company in 1902 fares were collected in fare boxes, the number of passengers being marked on what was known as a public way-bill by the conductor. These boxes were taken every journey to a central cash office, opened by a clerk, and the amount of cash entered on a way-bill and subsequently checked at the general office. It was obvious that this was a very unsatisfactory method, as the inspector, when checking the car, had no opportunity of ascertaining whether the fares had been placed in the box or not, and the conductor had no opportunity of challenging the amount of cash which was in his box if subsequently alleged to have been short on any particular trip. Further, in view of the immediate installation of an electric system, it was again obvious that with a quick electric service, conductors could not leave their cars each trip to pay their money in at the office; so it was decided to institute what is known as the bell-punch system, which is practically the system in vogue on all tramways at the present time and needs no description. It was commenced by the Leicester Corporation Tramways on July 23rd, 1903.

### BELL-PUNCH SYSTEM.

With the commencement of the electric system the collection of fares was a very simple matter, as practically only one kind of ticket was in use, viz., a universal 1d. ticket. On through cars a 2d. through ticket was issued if required, but the quantity was infinitesimal.

### OVERLAPPING TICKETS.

The first innovation was the institution of overlapping tickets. These tickets were issued on through cars only, to enable passengers to ride across the centre of the town on the inner portions of two sections for the 1d. fare.

### DISCOUNT TICKETS.

At the beginning of 1911, as a further concession to the public, it was decided to issue tickets in books of 13 for 1s., and to prevent fraud on the part of conductors purchasing such tickets, a specially coloured receipt ticket (green) is given in exchange for a discount ticket, so that a passenger paying cash would receive a white ticket, whilst a passenger paying by discount ticket would receive a green ticket.

All prepaid tickets received by the conductor are put into a paper bag and returned to the office with the unsold tickets, and the total should balance with the number of green tickets issued for prepaid tickets sold.

### TRANSFER TICKETS.

In August, 1911, it was decided to institute a system of transfer tickets, whereby passengers who wished to cross the town from a short distance on any side of the centre, where there were no through cars running, could do so by asking for a transfer ticket, the method being as follows:

Passengers getting on the cars in the transfer stage ask for a transfer ticket and receive a special ticket punched in the stage on which it is issued.

Transfer tickets are practically the same as ordinary tickets, with the addition of a key letter, which is changed every day. This prevents passengers using old transfer tickets. When a discount ticket is tendered for a transfer ticket, a different coloured ticket is issued by the conductor. These tickets are handed to the conductors of the cars transferred to, who issue a special receipt ticket in lieu thereof, and when balancing up with a day's takings only transfer tickets are accepted against these tickets.

Later on the system of transfer tickets was extended to outer districts, enabling passengers who do not wish to come into the town to transfer to a car running to another outer district at a point midway between the central and outer termini. The outer transfer stages are printed on one half of the ticket and the inner stages on the other half. The section punched by first conductor indicates whether the ticket has been issued for an inner or outer transfer stage, and also prevents passengers riding on one outer and one inner transfer stage.

| ·484 | Midland Railway Station, London Road .. | Clock Tower. |
| ·696 | Cobden Street .. .. .. .. .. | Clock Tower. |
| ·652 | Welford Road Junction .. .. .. .. | Clock Tower. |
| ·800 | Narboro' Road Junction .. .. .. .. | Clock Tower. |

Average distance per 1d. fare, 1·387 miles.

These stages are shown on the map attached.

### RETURN TICKETS.

On March 18, 1912, return tickets at single rates were issued on all cars up to and including 7-30 a.m. on week-days, enabling passengers to return with the same ticket on the same day any time after 2-0 p.m. week-days and 12 noon Saturdays. These tickets have a key letter (the same as the transfer tickets), which prevents the use of old tickets, and are issued for cash only, discount tickets not being accepted. A special receipt ticket is given by the conductor for the return journey.

### RETURN TRANSFER TICKETS.

Return transfer tickets are also issued at a single rate. These tickets enable passengers to ride on four sections for 1d., and are used in the same way as transfer tickets, and under the same conditions as to time.

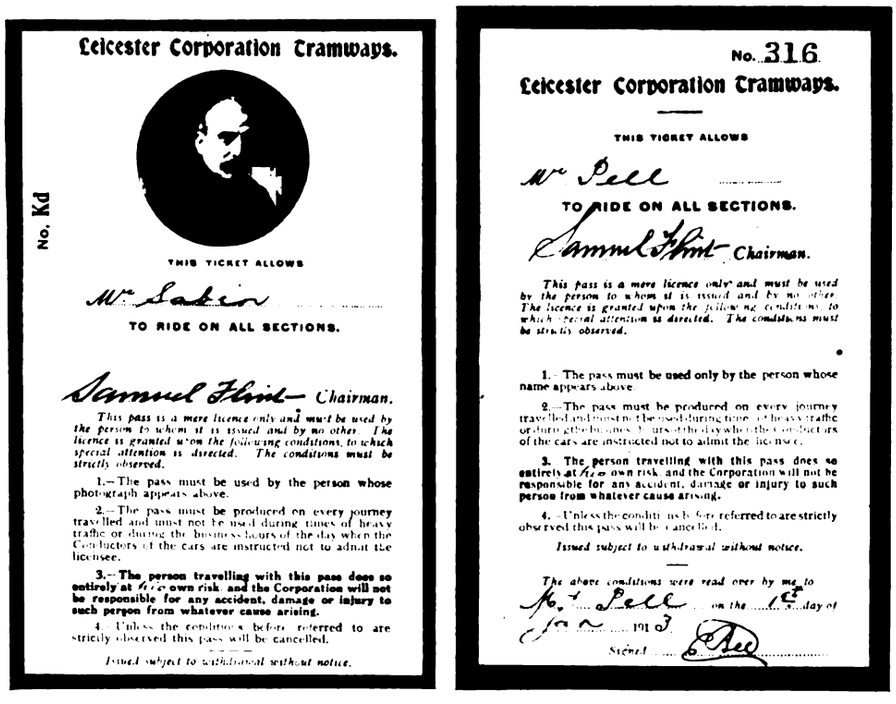
### CHILDREN'S FARES.

Children's fares at half-price (½d.) were instituted on September 9, 1912. These tickets are exactly similar to the ordinary white 1d. tickets with the exception of the colour, which is yellow with a red overprint, and are issued to children over six and under 14 years of age. Discount tickets are not accepted for children's fares.

Transfer tickets are also issued to children at half-price

### PASSES FOR BLIND AND CRIPPLED PERSONS.

Poor blind and crippled persons residing in the borough are carried free of charge, but the Corporation accept no liability for third party accidents, an indemnity being given by the local philanthropic societies against third party risks. One hundred and three passes have been



Specimen Passes for Blind and Crippled Persons.

issued to the blind and 98 to the crippled. Passes to the crippled are limited to 100. Above are facsimiles of passes issued.

It might have been feared that all these concessions would tend to diminish receipts, but such has not been the result. On the contrary, our receipts have steadily increased each year.

During the week ended Saturday, May 31, tickets were sold as follow:

ISSUED FOR CASH.

| | |
|---|---|
| 1d. white tickets .. .. .. .. .. | 586,481 |

| 1d. discount transfer tickets .. .. .. | 1,258 |
| Exchange tickets issued for transfer and return | 74,827 |
| | 840,880 |

### PAY-AS-YOU-ENTER CARS.

With the increase of traffic the work of the conductor has become very onerous, and it has become quite a problem as to how he shall get all his fares at rush hours, especially where the distance is very short, say to one of the principal stations where a conductor has perhaps to get 40 or 50 fares in a few minutes. To meet this difficulty it was decided at the beginning of the year to give a trial to the P-A-Y-E system of collection of fares in which the fares are collected as passengers enter the car. This system has been in vogue for the past six months on one of the sections (marked on the map), and has proved very satisfactory.

On the P-A-Y-E cars the platform is divided into two gangways by means of a rail, behind which the conductor stands and collects the fares as the passengers board the car. Passengers on paying their fares receive a ticket the colour of which denotes the stage to which they are entitled to travel, and on leaving the car the ticket is deposited in a sealed box fixed on the platform, specially designed for this system, which enables the motorman or conductor to detect by the colour of the ticket whether a passenger is over-riding. Transfer and workmen's tickets are issued on these cars, but passengers are not required to deposit these tickets but to show them on leaving the car.

Pay-as-you enter tickets are numbered in the usual way and booked on the way-bill, but are not punched, as if a conductor issues an old ticket he would be detected at once by the number if an inspector boarded the car. Samples of tickets and way-bills are shown at the end of paper. The contents of the deposit boxes are checked each evening and balanced against the tickets issued by the conductor. Particulars of instructions issued to conductors are appended.

In considering the experimental adoption of the pay-as-you-enter system, consideration was given to the advantage of minimising the risk of accidents caused through passengers attempting to board and alight from cars whilst in motion. During the year ended December 31, 1912, at Leicester, 449 persons received injuries through attempting to board or alight from cars whilst in motion. Our experience with pay-as-you-enter cars proves that accidents of this description are practically *nil*.

The conductor, always being on the platform of the car, is enabled to prevent people from risking this foolish practice. On the old system, where his duties take him inside and on the top of the car to collect fares whilst the car is on its journey, he has not the same opportunity of guarding the safety of the passengers.

It also does away with the irritation and discomfort to passengers caused by conductors having to push their way through crowded cars to collect the fares, especially in wet and inclement weather. Another advantage is that the conductor, always being on the platform, is less likely to leave intending passengers behind.

We find that the cars run well to time, and there is no more trouble or time lost in loading these cars than the ordinary ones. Of course very much depends upon the co-operation of the public, but our experience has been that passengers soon adapt themselves to the new system and have their fares ready.

The motormen and conductors working these cars are very much in favour of this system, the conductors because they can do their work more efficiently and without the excessive strain of constantly going up and down stairs to collect fares, and at the same time keep a proper look-out for intending passengers; the motorman because he can give the whole of his attention to his own end of the car, and knowing that the conductor is always on the back platform, it is not necessary for him to strain his neck in endeavouring to make quite sure the back platform is clear before starting the car.

With regard to the financial aspect of the pay-as-you-enter cars I regret at the present I am unable to furnish any complete comparisons. The route selected for the experimental trial of this system (Narboro' Road) was previously a through route and was chosen chiefly because it was a short distance and thickly populated. The passengers are

restricted to the district, and overlapping passengers, who are very numerous, due to the principal railway station being at the end of the overlapping stage, have been diverted to another section.

The receipts for 12 weeks ending July 5, on pay-as-you-enter cars amounted to £2,798—passengers 703,134; corresponding period of 1912 the receipts were £2,827—passengers 681,5778, or a decrease of £29 in receipts, the increase in passengers being accounted for by the recent introduction of halfpenny children's fares. The Western Park route, however, which has been altered to the through route, shows receipts for same period 1913 of £2,176 against £1,444 for corresponding period of last year, or an increase of £732, due in a great degree to the overlap and through riding. Taking this into consideration there has undoubtedly been a considerable increase in the sectional receipts, quite equal to, and I think in excess of, the average over the whole system.

A number of deputations from other towns have visited Leicester to see the pay-as-you-enter system at work, and amongst other questions, I have been frequently asked my opinion as to whether the system would be workable in towns where the fares are varied and complicated. I can only say that we have to deal with a complicated ticket system, as you will see by reference to the explanation of the working of the Leicester system, comprising discount tickets, transfer tickets, workmen's return tickets, children's tickets, etc., etc., and I think that there would be very little difficulty in adapting this system to meet any requirements.

My attention has also been called to an experiment being tried at Sheffield, where, as far as possible, the fares of passengers using the upper deck are collected on the platforms. Well, if it is better to collect the fares of the upper deck passengers on the platform it seems to me it must be better to collect from the inside passengers also. Moreover, there must be extreme difficulty in carrying out this system efficiently, especially at rush hours, and when cars are crowded on wet days, etc., and I should say a conductor would be more likely to miss fares where there is no defined method.

Naturally we have had a certain amount of public criticism in introducing a new system, this was only to be expected.

The chief complaints were:

Passengers on upper deck had to leave their seats some distance before reaching their stopping point to notify the driver.

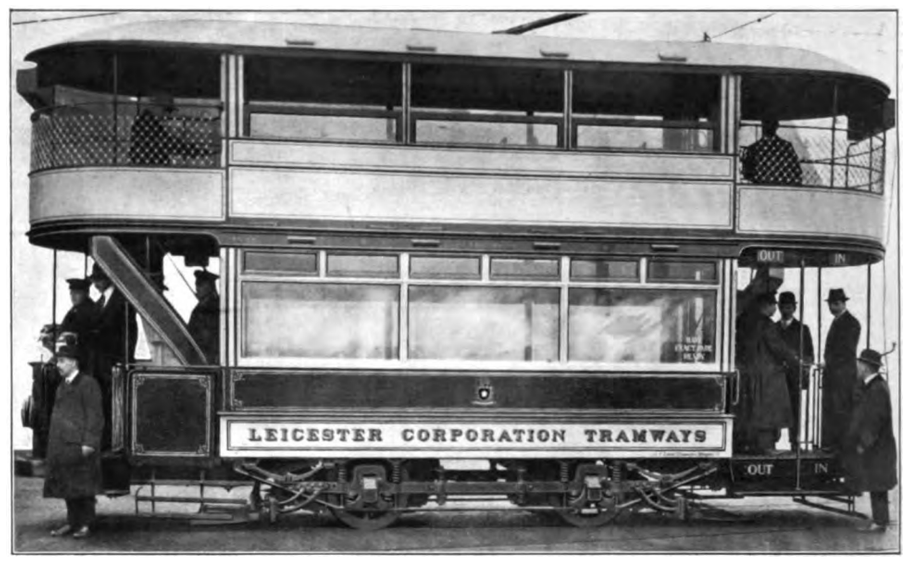
Continual opening of doors on upper deck made the cars very draughty.

There was no accommodation for luggage.

The staircases were narrow and steep.

The last two were the principal objections.

All these points have now been met. Accommodation has been provided for luggage and the design of the staircases is being improved. The first objections were overcome by allowing passengers *en route* to leave the car by either staircase. At the present time I do not think there is anything to which any reasonable person could raise objection.



**Leicester Corporation Pay-As-You-Enter Car.**

### TICKET BOXES FOR WASTE TICKETS.

In the interests of cleanliness and tidiness of the streets and cars, waste ticket boxes are placed on each platform, and a notice is displayed requesting passengers to deposit their tickets in the box when leaving the car.

### GENERAL REMARKS.

By a reference to the sample way-bill it will be noted that tickets issued for cash are practically duplicates of the tickets issued for prepaid tickets or tokens.

This system prevents fraud on the part of the conductor, only cash being accepted for cash tickets sold, and tickets for prepaid tickets sold.

If only one kind of ticket was issued it would be possible for the conductor to purchase discount tickets and pay them in instead of cash, thereby making 1d out of every 13 tickets purchased.

---

## LEICESTER CORPORATION TRAMWAYS.

STATISTICAL INFORMATION for the year ended December 31, 1912:

| | |
|---|---|
| Population served by tramways (estimated) | 229,296 |
| Traffic revenue .. .. .. .. | £134.966 6 0 |
| Total revenue .. .. .. .. .. | £147.671 7 9 |
| Car miles .. .. .. .. .. | 3,663,215 |
| Passengers carried .. .. .. .. | 32,907,795 |
| Average traffic revenue per car-mile .. | 8.843d. |
| Average traffic revenue per mile of single track .. .. .. .. .. | £3.647 14 9 |
| Average total revenue per car-mile .. | 9·675d. |
| Average working expenses per car-mile including power cost .. .. .. | 6·226d. |
| Average distance per 1d. fare .. .. | 2·18 miles |
| Average fare paid per passenger .. .. | ·984d. |
| Average number of passengers per car-mile | 8·983 |
| Average journeys per head of population per annum .. .. .. .. | 143 |
| Number of cars in stock .. .. .. | 150 |
| Total amount of sinking fund .. .. | £129,210 16 8 |
| Amount of reserve or renewals fund .. | £100,000 |

SUMMARY OF PASSENGERS CARRIED AND RECEIPTS.

Appended is a list of passengers and receipts since the inauguration of the electric system:

### INSTRUCTIONS TO CONDUCTORS ON P-A-Y-E CARS.

The following are the instructions issued to the conductors on the pay-as-you-enter cars:

This system of issuing tickets is called the colour zone fare system.

From Clock Tower to Narborough Road Junction is the red zone.

From Narborough Road Junction to the terminus is the white zone.

Thus all passengers travelling from Clock Tower beyond Narborough Road Junction must deposit a white ticket on alighting from the car.

From terminus to Clock Tower a red ticket must be deposited.

N.B.—From Clock Tower to Narborough Road Junction, on the outward journey only, either red or white. This does not refer to passengers purchasing on the car transfer or return tickets, who simply show them when leaving the car.

Ticket No. *Narborough Road Section.—Tower to Terminus.*

1.—Return brown to be issued to all cash passengers up to 7-30 a.m Ticket No. 1 to be retained by passenger when leaving car.

2.—White to all cash passengers from 7-30 a.m. to finish.

3.—White horizontal purple stripe to all children over six and under 14 years of age, either for cash or prepaid ticket at all times

4.—White perpendicular brown stripe to all passengers with prepaid tickets or tokens at all times.

5.—White perpendicular green stripe to be given in exchange for transfer from Narborough Road Junction to terminus, or return ticket, Tower to terminus at all times.

The above statement is a correct account of the Tickets handed to me this day

Motorman's Name ..... Conductor's Signature ..... No. .....

*Terminus to Tower.*

6.—Return brown to be issued to all cash passengers up to 7-30 a.m. Ticket No. 6 to be retained by passenger when leaving car.

7.—Red to all cash passengers from 7-30 a.m. to finish.

8.—Red horizontal purple stripe to all children over six and under 14 years of age, either for cash or prepaid tickets, at all times.

9.—Red perpendicular brown stripe to all passengers with prepaid tickets or tokens at all times.

10.—Red perpendicular green stripe to be given in exchange for transfer Tower to Narborough Road Junction or return, terminus to Tower, at all times.

When passengers leave the car, tickets Nos. 1 and 6 will be retained by passenger.

Tickets Nos, 2, 3, 4, 5, 7, 8, 9, and 10 must be deposited in box on car by passenger when leaving.

The above tickets (Nos. 1 to 10) must not be punched.

11.—Blue return transfer to all cash passengers requiring transfers up to 7-30 a.m. both ways. Passengers with return transfer tickets who have the second and third portion of their tickets must give the first part up when boarding the car and show the remaining portion of the ticket at the landing point.

12.—Blue ordinary transfer to all cash passengers requiring transfers after 7-30 a.m. both ways.

13.—Orange discount transfers to all passengers requiring transfers with prepaid tickets or tokens at all times both ways.

14.—Children's transfer: Blue, perpendicular red stripe, to all children over six and under 14 years of age reqniring transfers, either for cash or prepaid ticket, at all times both ways.

The above transfer tickets (11 to 14) must be punched in the section issued when sold, and retained by passenger when leaving car.

All prepaid tickets, transfers, and return brown returned to the office must be punched at the bottom by the conductor.

## DISCUSSION ON ALDERMAN FLINT'S PAPER.

The PRESIDENT: Alderman Flint's excellent and informative paper is now open for discussion by the Conference, and I propose to ask Mr. Councillor Smith, of Aberdeen, who has had some experience in this matter, to open the discussion.

Mr. Councillor J. A. SMITH (chairman, Aberdeen Corporation Tramways Committee): Mr. President,—My first duty is to compliment Alderman Flint on his paper, so full of information on the Leicester fare collection system, and I express my personal thanks for the interesting and most complete explanation he has given of the complicated ticket system of that city. The nature of our official duties teaches everyone here the necessity of getting all our fares, and the difficulties and problems that surround this duty. For this reason, Alderman Flint's experience of the P-A-Y-E system is most valuable, and is likely to be the centre of interest in this discussion. The Corporation of Aberdeen, which I represent here to-day, have also adopted the P-A-Y-E system on one of their routes, and I believe it is because of this fact that I have been asked to open the discussion this morning. If this be so, I am pleased to have the opportunity of acquainting you with our experience. Our P-A-Y-E cars are operated on one distinct route which runs north from its own terminus at Queen's Statue to Woodside, a distance of 2½ miles. Eleven cars are in use on this line, six of which were built new, and five other modern cars had their platforms extended and altered to the P-A-Y-E requirements. They have been running five months, and I am in a position to give you a complete financial comparison with the corresponding five months of last year. Let me say here that the difference between Leicester and Aberdeen P-A-Y-E cars is that in Aberdeen, only top deck passengers leave by the front exit. The lower saloon passengers leave by the exit rear door. On the top deck we have in addition a screen in front of the exit door, so that when passengers leave by the front top deck door there is no draught caused, and no unpleasant effects. Our ticket system also differs from Leicester in this respect, that our conductors use roll tickets, while in Leicester they use the packet tickets. Our fare system is also much less complicated, the fare being 1d. all the way, with five intermediate halfpenny stages, which do not overlap.

When the P-A-Y-E system was introduced five months ago, we feared that the congestion in loading would be too great, and would cause the cars to run late, but in practice we have experienced no difficulty. Passengers have become accustomed to the system, and have their fares ready. Very little change is required. Under the old system we had to exchange 10 silver coins for every 100 passengers, but under the P-A-Y-E system change is required by less than five per cent. of the passengers. Persons requiring change are required at a busy time to stand aside and give preference to persons with copper. In completely loading a P-A-Y-E car it will take generally slightly longer than the ordinary car, but the time saved along the route at each stop, with passengers loading and alighting at the same time, and the fact that the conductor is always ready at the rear end to give a prompt bell, more than makes up for the time lost at the termini. I am in a position to give the exact time taken on the same route on the old system, and the time taken with the new P-A-Y-E cars. On the

Digitized by Google

old system the total average time was 35·1 minutes per journey, against 34·2 minutes taken on the P-A-Y-E system, a saving of nearly one minute per journey. With regard to accidents, our experience is almost identical with Leicester. We all know the type of accident which is most frequent, and which often results in serious injuries to passengers; that is from persons boarding or alighting while the car is in motion. This type of accident is practically eliminated, because the conductor is always on the rear platform in a position to prevent these accidents, and not only to prevent but to aid elderly people and young children boarding and alighting. The system which allows the rear platform to take care of itself while the conductor is busy on the top deck or saloon is behind the age, and it is high time it was superseded by a system more thoughtful and humane.

Let me read an extract from a letter from the Chief Constable of Aberdeen, addressed to our general manager. It is dated August 22, 1913, and had no reference to this Conference or the paper under discussion. Mr. Anderson says: "With reference to your inquiry as to the opinion of the police on the 'pay-as-you-enter' cars, I beg to inform you that the opinion is favourable. Personally, I have noticed in particular the advantage to the travelling public of having the conductor always at his post at the rear of the car. As a consequence of this there has, as you know, since the inauguration of the system in April last, not been a single accident to a passenger entering or leaving the cars. The motorman is also free to give his undivided attention to the traffic on the street, there being no need for him to look round to ascertain whether passengers have safely left or entered the car, and there is thus less risk of the car being allowed to collide with any person or vehicle. Altogether the system appears to me to be a decided advance on the old system."

I thoroughly agree with and corroborate Alderman Flint's reference to the relief from physical and nervous strain on motormen and conductors—especially the conductors. The public should not expect the tramway servant to follow them to whatever part of the car they select to sit in, and wait till they leisurely find and open their purses for the necessary fare. The worry of getting all the fares is heavy on some conductors, and it is aggravated by much running up and down stairs. Besides, it is impossible to take up all intending passengers if long absent from the rear platform, and the undertaking consequently suffers from loss of receipts. I consider it is a great relief for a conductor to know that he has received the fare from every passenger aboard his car, and to find his duties thereafter confined to their safe passage through the journey. The advantage is a mutual one both to passengers and tramway servants.

In Aberdeen we have had very little fault-finding, and a great deal of co-operation on the part of the public. Any criticism we have had in Aberdeen is not so much against the system itself as against the width of the staircase. That is a fault easily remedied, and as a matter of fact we have constructed a wider and easier stair for the inspection of the Town Council against the time, now near at hand, when a decision must be made as to the propriety of extending the system to other routes.

Another point I wish to emphasise on this new type of car is the better regulation of passenger traffic. With the divided entrance, you prevent the usual crushing and jostling which takes place at busy times. We have all noticed passengers at stations having to wait a considerable time while those who wish to descend from the top have alighted. Under the P-A-Y-E system the top passengers leave by the front, and at the same time the saloon passengers are leaving by the rear platform, thus avoiding much congestion at the end of the car and saving time.

Now, with regard to the financial aspect of the question, are all the managers here present sure that they receive all their fares? I am not asking them to make admissions in the presence of their chairmen, but the general manager in Aberdeen thinks there is considerable leakage at busy times. This can be said without in any way questioning the diligence and conscientiousness of the conductors, or the honesty of the general public. Owing to the heavy traffic and increasingly cheap fares, the conductor's duties are becoming too numerous for him to execute properly, and some fares remain uncollected. The pay-as-you-enter system, from our five months' experience of it, reduces the conductor's work, and enables him to collect all fares without leaving the rear platform.

The receipts on the route in Aberdeen which is being operated on this new system have risen, for the twenty weeks ending September 17, by £468, an average of £23 8s. 0d. per week over the corresponding twenty weeks of 1912, and although we have in this period increased the mileage run, the rate per car-mile has also increased from 11·3 to 11·7 pence per car-mile. A certain amount of this is due to natural increase in the traffic, but we know also that a considerable part of it is due to the prepayment of fares. This, gentlemen, is our Aberdeen experience, and I hope it will be useful to you, and *apropos* of this discussion. My own opinion is that the system marks a great advance in the efficient working of tramway traffic. (Applause.)

The Mayor of Rochdale (Alderman Wm. Cunliffe): I am under the impression that the Board of Trade, at any rate as far as we are concerned, would prevent any leaving by the front entrance of the car. Is there any such regulation or prohibition by the Board of Trade in reference to that?

The President: If you ask my opinion, I think, if there is, there would be no difficulty in getting it altered.

Councillor F. G. Isherwood, J.P. (deputy mayor and chairman, Oldham Tramways Committee): I think we are all very much indebted to Mr. Alderman Flint for his very valuable paper this morning. (Hear, hear.) Leicester is peculiarly well situated for adopting the system he has referred to. He tells us that from the Square or terminus where all the cars start from, they go to the other terminus for the 1d. Now it is very easy to work the P-A-Y-E system in a case like that, but suppose they had a 3d. stage, and a man paid 1d. as he entered the car, what would become of the other two stages of the journey? I do not know whether I have made that clear to Mr. Flint, but in our town we have a 3d. stage. How would he collect the 3d? Suppose a 1d. were paid as the passenger entered, how would he get the other 2d? The conductor would have to go to the passengers again in the car, in that case, to collect the other 2d. I should like Mr. Flint to explain that in his reply.

Mr. Bailie Alston (vice-convener, Glasgow Tramways Committee): I want to ask a question of the reader of the paper, and one of the opener of the discussion. I should like to know how he would work out the colours for this example. We have on one route 35 half-penny stages. (Laughter.) There are also on that same route 1½d. stages, 1d. stages, and 2d. stages up to 7d., and it would be interesting to hear from Mr. Flint how his colour scheme would work out in dealing with the excess tickets on that route. Another point I should like to ask about is this; a person paying an excess ticket will always be on the platform when he is paying and leaving the car. I understand that is the case. Do you not find it a temptation to the conductor simply to put the excess fare in his pocket instead of punching a ticket? Passengers do not always wait when leaving tramcars to get a ticket and put it in the box. I should like an answer to that. Then Mr. Smith suggests that they have made an increase in the fares since they started the pay-as-you-enter system, and he suggests that there is so much due to natural increase. Everybody knows that, but I should like to know how he determines between what is due to natural increase and what is due to the P-A-Y-E system? That is a very difficult problem for me to see through, and I should like an answer to that question. I am much obliged to the gentlemen who have spoken for the able way in which they have handled the paper, and I hope I shall have the information I am seeking when the reply comes.

Councillor D. T. J. Lyle (chairman, Maidstone Tramways Committee): I should like to ask the reader of the paper—which I consider very valuable, and shows an improvement on the present system—what becomes of the conductor who is placed on the car for perhaps eight or ten hours per day? There must be periods when he would leave his platform. What becomes of the car in his absence?

Mr. W. A. Luntley (general manager, Wolverhampton Corporation Tramways): In adding my thanks to Mr. Flint for his excellent paper, may I say that there are just one or two matters I should like to refer to. First of all, with reference to discount tickets referred to in the paper, Mr. Flint said that a green ticket is given in exchange for a discount ticket, and a passenger paying cash receives a white one. Is it not possible for anyone to be in league with the conductor if the conductor were so inclined, and for the conductor to get the benefit of this discount? I do not see how an inspector would be able to check it; he could not see into the conductor's bag, nor distinguish whether a passenger gave a penny or a discount ticket. I should like some information from Mr. Flint on that point. With regard to the blind and crippled persons, we have, of course, all possible sympathy with those who are blind and crippled, but it occurs to me that it opens the path for a similar application from those suffering from other afflictions if concessions of this sort are wanted. With regard to the P-A-Y-E cars, Mr. Flint says, "The contents of the deposit boxes are checked each evening and balanced against the tickets issued by the conductor." I should like to know whether each conductor takes away the tickets deposited by the passenger with him when he is relieved. I presume that is so.

With regard to a later paragraph, as to the advantage of the conductor being always on the platform, Alderman Flint says, "Another advantage is that the conductor, always being on the platform, is less likely to leave intending passengers behind." Well, we all know that there is a constant complaint of tramway conductors leaving passengers behind at the stages, but it occurs to me, if he is handling 30 or 40 passengers at a busy stage and dealing with the fares, that it is not possible for him to look out any better with this system than the ordinary system. In that connection, although I have not seen the Sheffield or Leicester systems in operation, I think perhaps the Sheffield arrangement is a little better, because he can get rid of a big portion by placing them inside, so that he would not have so many to attend to afterwards.

Mr. A. L. C. Fell (chief officer, London County Council Tramways): I should like to congratulate Mr. Flint on his paper, and the interesting account he has given of the P-A-Y-E system. I had the opportunity yesterday of inspecting the pay-as-you-enter system in

Digitized by Google

Leicester, and there were one or two points which struck me, which I should like to ask Mr. Flint about. Can he let us know what the cost would be of altering ordinary cars so as to make the P-A-Y-E system possible? (Hear, hear.) The question of alteration of existing cars, speaking from my own London point of view, would be a very serious matter, because with our present platforms and staircases it would be absolutely impossible to institute the P-A-Y-E system. We had some years ago reverse staircases on our cars, but those reverse staircases unhappily did not comply with the by-law made by the London County Council, and the police authorities insisted on our altering the staircases on the first 400 cars, and that cost somewhere between £4,000 and £6,000. I understand if we institute the P-A-Y-E system we shall have to go back to the reverse staircase car, and so you can imagine with something like 1,750 cars to alter it would mean a very serious matter.

Then another item of cost comes in, and that is the question of the royalty and the apparatus one has to instal on the car itself. I noticed that in Leicester, with the platform divided, they made a sort of recess for the conductor, and I came to the conclusion that they must breed a specially thin conductor in Leicester, because it would be quite impossible for an ordinary London conductor to get in. I asked one of the conductors how he managed to get into the recess, and he said they worked them so hard in Leicester that they never had an opportunity of getting fat. (Laughter.) Whether the institution of the P-A-Y-E system has reduced the weight of the conductor I do not know; perhaps Alderman Flint will tell us, because we do not like to throw all the work on the conductor. The next point is that the driver should drive the car, and not look after passengers, and I think that is one of the greatest advantages of the P-A-Y-E system. Another thing I noticed was that they had no bells upstairs for the passengers to give warning when they wanted to stop the car, and it was necessary for the passengers to get up and wander to the end of the car, so that the man standing on the platform could see if anybody was coming off the roof. If we had our passengers in London wandering about on the top of the roof between the stages, I am convinced the number of accidents we have would be about trebled. We have a large number now, owing to the heavy traffic and the car having to stop suddenly. Passengers are apt to get thrown down, and if they were allowed to wander about promiscuously between the stages, I am certain those accidents would be increased.

Mr. Flint says the cars in Leicester run well, and to time, but one question that struck me was, "what time," because they do certainly lose a good deal of time at the start, where passengers are getting on. I happened to be there as the people from some theatres were coming out the night before last, and there were a large number of passengers trying to get on at the terminus. The conductor was certainly wonderful in the way he issued the tickets, but I noticed one old lady who did not take the trouble to take her purse out of her pocket before she got on the platform, and then began fumbling with her purse. She had to be put on one side. There was not much room, and it caused considerable congestion to persons trying to get in the car. I am afraid if we had to issue tickets in that way at a busy point there would be tremendous delay, and the result would be that our friends the opposing motor 'buses would come along and sweep up the lot, and we should not get them at all. (Laughter.) It is, of course, easy to put up a notice saying that passengers must have their fares ready, and that is all very well for the regular rider, who gradually learns—even a tramway passenger learns—but the casual rider does not know, and it is the casual rider who will cause all the trouble when you institute this system. Still, I do not wish to say the system should be condemned, because I think there is a great deal in it, and a great deal may come from the splendid pioneer work which Leicester and Aberdeen are now doing. I still have hope that we may have a system something like this installed on most of our tramways, so as to make the time on the journey as short as possible. I congratulate the reader of the paper on the excellent work he is now doing. (Applause.)

The Mayor of Reading (Alderman C. G. Field): I should like to say a few words on the point you emphasised, Mr. President, and ask the member for Aberdeen to explain his statement as to time saved on the route. We have it from him that the route is 2½ miles long, and that with the old system it took 35·1 minutes, and with the new system it takes 34·2 minutes, and thereby saves practically a minute. But he did not tell us that the speed at which the cars run at Aberdeen is only something under 4½ miles an hour. And I should say it would be very easy indeed ——

The President: Are you sure that statement is correct?

The Mayor of Reading: I took it down at the time. I am asking for the explanation.

A Delegate: The time given is for the round trip, the double trip.

The Mayor of Reading: Oh, then it is not only five miles an hour. I am answered.

Councillor W. H. Buist (Dundee Tramways Committee): Mr. Flint spoke of the fact that in Leicester the motormen had been relieved of the duty of looking for passengers, but I think he forgot for the moment that in Leicester it seems an additional duty has been put on the motorman of examining the tickets of passengers as they descend from the car, and it seems to me it is going from Scylla to Charybdis, and that the cure is worse than the disease.

I was going to ask Councillor Smith, of Aberdeen, how they check the passengers who have halfpenny tickets, as to whether they over-run the stage or not. I would also ask both gentlemen, who are advocates of the P-A-Y-E system, how they manage in the rush hours. I remember in one of the cities of the States I boarded a pay-as-you-enter car, and there were 121 passengers got on the car which seated 53, and I am quite certain 20 or 30 of them never paid, and I wonder how they would deal in the rush hours with abnormal traffic such as that.

Mr. H. Mozley (general manager, Burnley Corporation Tramways): I was very pleased indeed to see that Leicester and Aberdeen rose to the knowledge that they were losing fares by their defective system of checking, and whether you adopt the P-A-Y-E system of getting fares, or the system which is in operation, and has been in operation since 1881, on our own system at Burnley, namely the collection of tickets, it does not much matter to me; but I do feel sure that the tramway owners of this country up to now have lost very large sums annually, and therefore this is a very opportune subject to bring before this Conference. I do not intend to say more, except that I think this is a matter which deserves your very serious consideration.

Mr. J. W. Dugdale (general manager, Oldham Corporation Tramways): I should like an explanation as to the manipulation of ticket No. 7641, which is illustrated in the paper.

Mr. W. Clough (general manager, Bury Corporation Tramways): In considering the paper which Alderman Flint has so ably placed before us, I have tried to remove from my mind any prejudice which, along with other managers, I have had against this American system of fare collection. The opinions of the author are based on actual experience, and for this reason should not be opposed without some hesitation. At the same time, many of us whose daily task it is to study the proper collection of fares can see difficulties which, were it not for the Alderman's experience, would lead us to conclude that the system would not have worked so satisfactorily as he has been able to state. If he had told us that this system was in use on a very slack route, we could have understood his conclusions, but he states that the problem at Leicester was how to get the fares at rush hours, and that the solution is to get them on the platform. With a car with such a short platform as shown in the illustration, it must of necessity take more time to do this, and to this extent the car must be delayed at busy loading points; but it may be that this time is regained *en route* by the fact that the conductor is always at the back of the car to restart it.

We are also informed that passengers are now allowed to leave the cars *en route* by either platform. Is this desirable? Will it not take the attention of the motor-man from his driving, for we must remember that under this system the motor-man has to see that the passenger has paid his proper fare, and it is also the motor-man who has to see that an excess ticket is obtained in cases of overloading? This would be bad enough *en route*, but at the terminus, when a large number of passengers are hastily getting off the cars, for instance, to go to a football match, it would be an absolute impossibility. I may point out that the Alderman tells us that the overlapping passengers, who are very numerous, have been diverted to another section. If this system is to be extended over the whole of the tramway system of Leicester, those overlapping passengers will have to be dealt with.

The remark that those P-A-Y-E tickets are not punched seems to imply that there is something special in connection with those tickets, which does away with the necessity for punching. I cannot find that there is any difference from any other ordinary ticket, yet on practically every tramway system it has proved essential that the tickets should be punched, and that we cannot solely rely upon an inspector boarding the car. The mention of not punching the tickets raises a suspicion that this is omitted in order to save time when loading the car at busy times. It is no surprise to hear that Mr. Flint has frequently been asked whether the system would work in towns where the fares are varied and complicated, and I must join issue with him when he replies that there would be very little difficulty in adapting this system to meet any requirements. Many systems have all the kinds of tickets in use in Leicester, but it makes a huge difference when, in addition, you have fares ranging from 1d. to 4d. You have only to read the instructions to conductors at Leicester to realise what would have to be done in towns where there is a varied fare system.

In the conclusion of the paper mention is made of a method of handling prepaid and discount tickets which prevents fraud. A white ticket is issued for cash, and a green ticket for prepaid tickets. When the effect of this is reasoned out, does it not come to this, that in Leicester each passenger can be relied upon to see that he gets a ticket of the correct colour? You cannot do that on many tramway systems, and Leicester is to be congratulated on the interest which the passengers take in the collection of fares. (Applause).

Mr. J. M. McElroy (general manager, Manchester Corporation Tramways): I have recently had an opportunity of studying this question collaterally with other questions in the United States of America, and it is perhaps a little interesting at this stage to see what the history of this P-A-Y-E system has been. On my former visit to the

Digitized by Google

States, six years ago, the two factors connected with the operation of tramways there which attracted my attention were, first, the danger which attended passengers boarding the cars, owing to the peculiar construction of many of their long open-sided summer cars; and, secondly, their method of fare collection. We all know that in those days many companies in the States were paying claims for accidents amounting to something like 5 per cent. of the gross takings. You know no such thing obtains in this country. The number of accidents, due to boarding and leaving the cars, were very large. As to the second point, the method of collecting the fares, I do not know whether you all know what the system was. You paid your nickel to the conductor, and he pulled a strap at the roof or side of the car, and the fare registered at the end of the car; there was no giving of receipts or anything of that kind.

These two things appeared to me to be two very weak points in the operation of the American tramway systems, but on my recent visit I found a great change had taken place as regards these two points. The change was connected with the keeping of the conductor at the rear end of the car, in order that he might collect everybody's fare, and also prevent tail-end accidents on the car. Everywhere I went they said their accident claims had gone down enormously, and their receipts had gone up proportionally on account of seeing that every passenger properly paid his fare. I think the United States and Canadian people were led to do this and to effect these improvements because they have a universal fare, which is a nickel, and their operating expenses, like our own, have a constant tendency to go up. They are spreading tramways in all directions, and they were finding that the margin between receipts and operating expenses was growing so small that they had to make these changes. They have done exceedingly well by this system of pay-as-you-enter. Nowhere did I see any undue crowding to get on the cars, and I rather fancy that is not one of the weak points of the P-A-Y-E system so far as the United States is concerned. But when you attempt to apply the conditions to our own country, you will find a different set of circumstances. Here we have been in the habit of giving every passenger a receipt for his money. We tell a passenger he can travel from one point to another, and that he must get a receipt for his money. If it were possible to have a simple condition of affairs such as exists in Leicester, I think pay-as-you-enter is the right thing, because we can keep our conductors on the platform and get our fares, but when it is to be applied to conditions such as obtain in London, Glasgow, and Manchester, where we have a large number of overlapping fares, it seems to me it is practically impossible to do it. With regard to the alteration of cars, I think if the principle is admitted that you should have the conductor on the platform to prevent accidents and get the fares, if it is possible it ought to be done.

I am much interested in what Mr. Fell said about the motorman having nothing to do with the loading of the passengers. Strange as it may appear, one of the newest kinds of car in the United States is what they call a near-side car, where the passengers board the car at the motorman's end, and it is the motorman who opens the door for the passengers and closes it, the idea being that as he cannot start the car until the doors are closed, people cannot have an accident in boarding the cars. It is interesting to compare the different ideas—what Mr. Fell thinks would be suitable for London, and the newest idea of tramcars in the States. I think, if it were possible to have a simple flat fare, then pay-as-you-enter would be is the right thing. (Applause.)

Alderman G. BANTON (vice-chairman, Leicester Tramways Committee): Speaking of the system which obtains in Leicester, we have tried it because we wanted to gain knowledge and experience. In the first place, we were not satisfied with the methods in existence, and we knew there might be some improvement, and seeing the necessity for having more cars we thought it would be wise to find out if there were any new method in existence, and if our cars could be built on the most modern system. The Americans are now pretty alert, especially in the collection of nickels, and they are not easily led away by a new thing because it is new, but are always ready to adopt the best system possible. The fact that they have done something in this direction was an encouragement for an Englishman to try it, and in Leicester we decided that the ten new cars should be built on the principle of pay-as-you-enter, and a platform was constructed which would facilitate this. We have had for some months our first pay-as-you-enter cars, and taking it broadly we are fully satisfied with the results.

First of all, we were alarmed at the number of accidents and claims for damages. You have the same claims in your own towns I suppose, but we felt we had some share of the responsibility, and that it was the duty of any committee to obviate accidents if possible. So the system of pay-as-you-enter, and keeping the conductor always on the platform, has by experience proved to be a success. Our expenses now are, comparatively speaking, nil; we have had no claims put in up to the present time, and that is one great point. We have not been able to gauge much by the returns, owing to the alteration of the system. I happen to live near the route, so I know why it is that the receipts have apparently diminished £29 over a certain period, and on the other route in the same portion of the town they have gone up to a tremendous extent. We know it is not all due to the small growth of population or the growing habit of riding, so we credit a portion of that to the overlapping system, and we know we have not lost anything by adopting the new system of pay-as-you-enter. Altogether there is the fact of accommodating our passengers—and this is a very important point—and the absence of inconvenience caused to the passengers by loading up. I have stood many times and watched, and I dare guarantee that we fill a car as quickly by the P-A-Y-E system as could be done without it. That is a bold assertion, but I think you will find in time the assertion can be proved.

You all know that a crush of people will not get through a door so quickly as an organised body of people. Your queues at the theatres and queues at the stations demonstrate that. You want to organise into queues, and offer facilities to get the passengers accommodated more quickly. People will adapt themselves to it; they do not crush and push and get half a dozen people on the platform at the same time; they take their turn and have their money ready, and you get the people on the cars more quickly.

A point was also raised as to whether, by collusion, the conductor could keep the fares. I doubt whether any gentleman has devised any perfect check, and I do not suppose there is any perfect check where you can guarantee there is no chance of collusion. I think this is the nearest approach, and if there can be any defrauding it is at the minimum under this system. As to the time taken, you have to gauge the traffic by the total time, and not by one particular point, and we do know by experience that we can get the cars through in a shorter time

**Alderman S. Flint**

*(Chairman, Leicester Corporation Tramways Committee).*

than hitherto. We do not take our time in Leicester: we like to get the traffic through as quickly as possible, and we can compare with any other towns with regard to the length of time per mile. So, taking all the points, we think we are justified in going still further with this experiment.

I had one of the principal objectors to see me the other day, and points were raised against the new system, and we have got over them. But there was one very grave defect, and that was that they were deprived of the through running, and when I informed this gentleman that we were going to propose the building of more cars, so that we might have through running, he said "If that is so, we shall be heartily satisfied." The system itself is not bad. Anyway, we are going forward with the building of new cars in Leicester, and we think the system is so successful that we are going still further to extend it. As to the cost, it would depend upon whether you think it advisable to spend more money. In Leicester we have a fairly profitable concern, and we do not fear the new system. Anyway, if you do not adopt the P-A-Y-E system, the new platform in itself is a great advantage, and your passengers will find the benefit of the larger platform and improved staircase. In Leicester, after all the points have been taken into consideration, the Traffic Committee—of which I have the honour to be chairman—are practically unanimous on the good points, and have resolved to order new cars. (Hear, hear.)

**ALDERMAN FLINT'S REPLY.**

Mr. Alderman FLINT (replying on the discussion): I am not the author nor the inventor of the P-A-Y-E system, and all I was asked to do was to give an account of how it is answering in Leicester. I am not going to say we have reached finality or perfection, but I certainly think, from the few months' experience we have had, that the system

Digitized by Google

has come to England to stay. Alderman Banton has just told you that the Tramways Committee of Leicester—and I think they were unanimous, except for one vote which was neutral—have decided upon an extension, and we are ordering another ten cars, in order that we may have a through service. I have had questions asked as to the time occupied, and what did I mean by "usual time." I meant by saying that, that it takes as long to do the service now run as under the old system, but when we have the new service from one side of the town to the other through the centre, we shall probably save, as far as we can calculate, one car in twenty; that is to say, nineteen cars will do the work of twenty. If you can carry that out, there is not much cause to complain. Mr. Fell mentioned the case of an old lady, which caused a little consternation. I think old ladies of either sex cause consternation (laughter) whether in tramway matters or otherwise, and we do not devise a system to meet isolated cases of old ladies. We have to go on broad lines and meet a public want, doing it in the most efficient and economical manner possible, and to the satisfaction of the people.

When we run our cars through and right across town, I think we shall have as complicated a system as exists anywhere. Of course, I have not given you every little difficulty we had to contend with, but we have overcome them all, and the number of exceptional cases we have with all our tickets I think are about as complicated as any system in the country. We have not such a big system, but it is a complicated system, and my own impression is that with the different marks and the stripes on the tickets we can get over all the difficulties—even the case of the gentleman who had 38 stages on one route.

I am informed that the 'bus companies in London have ordered 24 cars to try this system, and that perhaps will be information for Mr. Fell. It will be an interesting experiment for London. I am glad to find that for the Aberdeen tramways they have more complete figures, because they are carrying on the system on the same basis as before. We followed, and it has come out all right, and I am sure it is a cheaper system, and on the whole there is less delay with this system than the other. The delay is caused at the starting point, but you pick up more time on the rest of the route.

I think Mr. McElroy has given a good account of what has taken place in America. Two years ago I was in America and Canada, and I saw there was something in this system. I do not know that everything is necessarily good because it comes from America or Canada, and there are many respects in which they can learn from English customs and systems, but in this particular instance I think the system is a good one, although it was started in America. Probably you know they have some 20,000 cars running in those two countries under this system, and if it answers there I do not see why it should not answer with us. Perhaps you will excuse my not answering all the points raised, because it would take up too much of your time; but if there is any specific question I have not referred to, I shall be glad to reply.

The PRESIDENT: We shall be very pleased to hear Mr. Smith.

Mr. T. R. SMITH (electrical engineer, Leicester Corporation Tramways): It is difficult to give the exact cost of alteration, because we have not converted one car, but for the lengthening of the platform at each end and providing another staircase it works out between £30 and £40 per car. The royalty is £20 per car.

Mr. MOZLEY: Lengthening the platform affects the clearance on the curves. That is a difficulty on the bulk of English cars—the swing of the car. How do you get over that difficulty?

Mr. SMITH: There has been no difficulty experienced yet in Leicester.

Mr. FELL: Is the royalty in perpetuity?

Mr. SMITH: It is one payment only. The £20 royalty is paid for each car adapted to this system, and as long as that car is on the road it is clear from any further payment.

The PRESIDENT: I am sure it is your wish that we tender to Mr. Alderman Flint our hearty thanks for the excellent paper he has given us, which has called forth this interesting discussion.

The resolution was carried amid applause, and the Conference then adjourned for luncheon at the Grand Hotel.

## LUNCHEON ON WEDNESDAY.

On the invitation of the Chairman (Alderman Sir William Clegg, J.P.) and members of the Tramways Committee of the Sheffield Corporation, the members of the Association were entertained on Wednesday to luncheon at the Grand Hotel. Mr. Councillor A. J. Bescoby, the deputy-chairman of the committee, presided in the absence abroad of Sir William Clegg.

After the toast of "The King,"

Mr. Councillor A. J. BAILEY, J.P. (member of the Sheffield Tramways Committee) proposed the toast of "The Municipal Tramways Association (Incorporated)." He said: I have a very pleasant duty to perform. I do not know why I should have been selected to have proposed this important toast, or whether your President, who is one of the shrewdest and acutest business men I know, thought it would be an advantage to link a Labour leader up with the Municipal Tramways Association or not. I do not know, but I am without question a strong believer in organisation, and I feel pleased from one point of view that I can propose this toast without any feelings of regret whatever, because I believe your Association have never attempted to come into direct conflict with the organisations with which I am connected. I am certain they have done a good deal to improve labour conditions in several directions. Your Association is, comparatively speaking, new; but I venture to say that in its short period of existence, some 13 or 14 years, it has accomplished a very great amount of work indeed, and work that has been beneficial to our municipalities and of benefit to the general public. This robust growth of the tramway system is remarkable. I notice in one of your papers to be read during the week the writer says that some short time ago it was said that tramways were played out; so far as I can see we are only just being played in. (Applause.) There is as great scope for the Association in the future as there has been in the past. The strides we have made during these 13 or 14 years are amazing. From 1,200 miles of tramway we have got up to nearly 3,000, and we have an invested capital of £53,000,000. And it is pleasing to those of us who are connected with municipalities to know that we have an Association of this character represented here to-day which is endeavouring to keep its fingers on the pulse of the tramway world, noting every movement that is going to be of benefit and advantage, and checkmating, if possible, every movement that is detrimental to the best interests of tramways. You have been able to nationalise things; you have been able to centralise things, and you have been able not only to obtain information from all sources, but to condense it and put it in understandable form and stated as near perfection as it is possible for man to get. And whether we are dealing with difficulties of municipalities, or with difficulties with the Post Office, we always find advice or information that is useful from the Municipal Tramways Association. If, again, it is a question of the promotion of a bill in the House of Commons, either in the interests of municipal tramways, or a bill that may tend to militate against municipal tramways, we find your Association to the front, and assisting municipalities in a way that I venture to say it would be very costly for them to get people professionally to do. If it is a question of dealing with the Board of Trade; if it is a question of standardising tyres or axles; or a question of rail corrugation, your Association has been to the front all round. So, Mr. Chairman, I have pleasure in proposing this toast. I do not agree with the gentleman who said that we were getting to the end of the tramway world. I think there is any amount of scope for development, any amount of scope for work for the Association in the direction in which it has been working in the past, which I do not hesitate to say has not only been of benefit to the municipal bodies, but has been of benefit to the public in general. I am in private life a trade union official. I believe in organisation all round; the better the organisation the stronger, and the stronger it is the better it is and the more advantageous it is to the general public good. I have very great pleasure in asking you to drink this toast of "The Municipal Tramways Association (Incorporated)." (Applause.)

Alderman H. LINSLEY (chairman of the Salford Tramways Committee and vice-president of the Municipal Tramways Association) replied: As an old member of this Association and as a friend of every member of the Executive, it gives me very great pleasure indeed to reply to this toast. I think the proposer of the toast has been very generous in the things he has said with regard to our Association, but I believe the Association does deserve everything he has said about it, because I believe that it is doing very excellent work. There are very many people who think that the whole work of this Association is the Conference which we hold once a year. That is a very great mistake. We have a very excellent Executive—barring myself of course—(laughter)—and during the whole of the year this Executive Committee is trying to settle things and study things and solve the difficulties which arise in regard to city traffic. At the Conferences every year, such as we are holding now, we take stock of the position, so to speak, and review the progress we have made. During the present year we have had some very difficult matters to negotiate, and in one or two cases our President, Mr. Fearnley, your own manager here in Sheffield, has come out in very grand style; he has shown us what he is made of. When we met the Postmaster-General in regard to guarding of overhead wires, the President rendered excellent service; it is true that we have not got the satisfaction we should have liked, but I was having a chat with a town clerk the other day, and he is very sorry we have agreed to the terms proposed to us, because he is quite prepared to fight the Postmaster-General, who he says is altogether wrong in making those terms. He has thrown out a challenge, and is quite prepared to meet him in court any day and test the case. I hope he does, and I hope the Conference will support him. I do not know whether we could change the Postmaster-General's views or not, but anyhow I should be inclined to have a try by some means or other. As a very old member of this Association, I do appreciate the kind remarks of the proposer of this toast, and have very much pleasure in responding. (Loud applause.)

## WEDNESDAY AFTERNOON.

The Conference was resumed at 2-30 p.m., and the President at once asked Mr. Fenton to give his paper on "The Maintenance of Paving on Tramway Track as affected by Section 28 of the Tramways Act, 1870."

Councillor Wm. C. Fenton: Mr. President,—I think I will reverse the order of things, and before I proceed with my paper I wish to extend my acknowledgments to the gentlemen whose names are at the end of it. I mention them first, because our President, Mr. Fearnley, and the other gentlemen named, have supplied me with such valuable information that I feel it is not merely a cursory acknowledgment, but a real and necessary acknowledgment of the assistance they have given in the preparation of the paper I wish to lay before you this afternoon.

Mr. Fenton then read his paper.

# THE MAINTENANCE OF PAVING ON TRAMWAY TRACK AS AFFECTED BY SECTION 28 OF THE TRAMWAYS ACT, 1870.

By Councillor Wm. C. Fenton, F.R.I.B.A., A.M.Inst.M. & Cy.E.

According to a speaker (Sir J. H. A. Macdonald) at the Imperial Motor Transport Conference on July 25 last, "the day of the tramway was over," and if that be the case it would be a waste of time either to discuss the subject matter of this paper, or for you to attend in such numbers at this important Conference—unless you had assembled to pronounce a solemn requiem on the demise of the vast concerns which you have hitherto carried on with such benefit to the community generally. But one is inclined to think that such statements are more than premature; that in this case "the wish was father to the thought," and though undoubtedly the motor has and will have great uses, you must still look forward to a long life to the tramway and continue to deal with all the phases which will increase or decrease its efficiency from year to year.

It needs, therefore, no apology for bringing this question of paving before you to-day, and though the law as laid down by Section 28 of the Tramways Act, 1870, has been the subject of more than one discussion in previous Conferences the opinion is generally expressed that the matter has become increasingly urgent and deserving of fuller discussion in view of the changing circumstances of the times.

In dealing with this subject, I am desirous of presenting, as far as possible, an impartial statement of the present aspect of the question; not to urge my own views, but to lay before you a basis for discussion which it is hoped will prove both interesting and instructive, and may in the end lead to some satisfactory settlement of an important and difficult problem in tramway finance and management. To refer for a few moments to the historical side of the question, I do not intend to weary you with many dates and details, but only sufficient to lead up to its bearing upon the important question at issue.

When tramways were first introduced into this country by George Francis Train, about 1861, they were laid by arrangement with local authorities and not by Parliamentary powers. These "tramways" were such a nuisance to general traffic that they were cleared away by mandamus. In 1868, however, three Tramway Acts were passed for the Metropolis, and the numerous applications for private Acts resulted in the Tramway Act of 1870, which stands to-day as the principal authority governing tramway procedure and practice. I need not refer to this Act in detail; its provisions are well known to you all, but Section 28, as the subject matter for this paper, will be referred to later. Experiments were made in steam traction as early as 1873, but it was not till 1880, or a little later, that it became an accomplished fact. The first cable system was inaugurated at Highgate in 1884, and electric traction by accumulators was first tried in Birmingham in 1890. The advent of electric traction by overhead wires led to the passing of the Light Railways Act, 1896, by which the procedure for the acquisition of powers for tramways and light railways was much simplified.

In view of recent events it is very interesting to note that Lord Morley when piloting the Bill through the House of Lords said "that light railway includes not merely all tramways, but any railway which the Board of Trade thinks may justly be brought within the scope. It certainly includes tramways in towns, and it might include large trunk lines throughout the country." The present House of Lords, or at any rate its Law Lords, apparently, do not agree with Lord Morley's interpretation of its powers, and the conundrum, "when is a tramway a light railway?" or vice versa, still remains to be solved.

I need not refer to the various methods of electric traction—overhead, surface, or conduit—which have developed during the last 10 to 15 years, because in every case—except, perhaps, with the small exception of surface-contact systems—they are all more or less affected in the question of road maintenance.

Now Section 28 of the Act of 1870 provides, *inter alia*, that:

> "The promoters shall, at their own expense, at all times maintain and keep in good condition and repair, with such materials and in such manner as the road authority shall direct, and to their satisfaction, so much of any road whereon any tramway belonging to them is laid as lies between the rails of the tramway and (where two tramways are laid by the same promoters in any road at a distance of not more than 4 ft. from each other) the portion of the road between the tramways, and in every case so much of the road as extends 18 inches beyond the rails of and on each side of any such tramway."

It must be remembered, also, that the Act did not then provide for local authorities to work their own systems, but contemplated companies only providing this public convenience. It was, therefore, necessary that the public should be safeguarded and protected as carefully as possible both as regards safety and sanitation. Moreover, only animal power could be utilised under the Act, and the wear and tear of the paving was likely to be much greater (being confined to rigid lines) than if spread over the whole surface of the road.

Experience showed that even in the days of horse traction there were two sides to the case. How many times have most of us seen, as well in those days as to-day, heavy traffic having about the same gauge as the tramways taking advantage of the easier traction by deliberately going in front of the trams and adding very considerably to the wear and tear of the paving? And though the increased speed of the electric trams has to a large extent modified this practice of the slow and heavy vehicle, yet the faster traffic, both heavy and light—as they are undoubtedly entitled to—use the tram tracks in preference to the sides of the roads. Though this Section of the Act was necessary in the interests of the public, and, as I have said before, experience showed that even horsed tram traction by no means had the monopoly of wear and tear of the paving, yet as long as companies who had "neither bodies to kick nor souls to save" worked the systems, and presumably made money out of them, any grievance which they had in this respect would not be considered. Even the introduction of steam traction made very little difference, and probably justly so, because hot ashes and cinders contributed to the wear and tear of the roads. The cable systems might have brought the question into prominence had there been more of them and if they had been owned by municipalities. The advent of electric traction as an agreeable and paying novelty only caused a voice to be raised here and there, and it was not until the last six or seven years that the injustice of the present system was voiced in definite form. This has been mainly brought about by two causes:

1. The obsolescence of the factors upon which Section 28 was founded.
2. The great increase in both heavy and light motor traffic since the development of internal combustion engines, and improved steam tractors.

At the 1907 Conference a certain amount of discussion took place, in which Councillor C. F. Spencer, of Halifax, expressed his Committee's opinion that the present state of the law was an injustice, and Mr. Blain, of West Ham, brought forward one of the strongest arguments for revision that had up to then been enunciated, viz: that in many cases the camber of roads had been so arranged that the whole of the traffic should travel on the area maintained by the tramways. The matter was then referred to the Executive for consideration and report.

In the following year (1908) the Executive reported to the Nottingham Conference that they could not recommend any definite action "at the present time." This led to an animated discussion, and Mr. Blain's resolution to refer the matter back for further consideration was lost by 41 votes to 20. It was at that meeting, too, that one probable solution of the difficulty—differential rating—was mooted.

In 1910 the question was raised at both the Tramways and Light Railways Congress and the Municipal Tramways Conference: at the former, in Mr. Fred Coutts' paper on the necessity for revision of the Act of 1870, and at the latter, in Alderman Flint's paper, in which he said:

> "The old custom under which all tramway committees have to keep in repair the centre of the track and 18 in. outside the rail is also one that calls for re-consideration and revision. It was quite right under the old conditions in the days of horse cars, when they were run for private profit, and when roads required constant cleaning and repairs on account of the car traffic. But the running of electric cars does not involve this extra expense to nearly the same extent; therefore the continuance of this custom means that tramway committees have to relieve highway committees of their responsibilities, or, in other words, passengers on the cars have to relieve ordinary ratepayers of their burden.
>
> "A first step should be to relieve the tramway committees of the duty of maintaining the 18 inches outside the rails. The wider question might then be left open for a time."

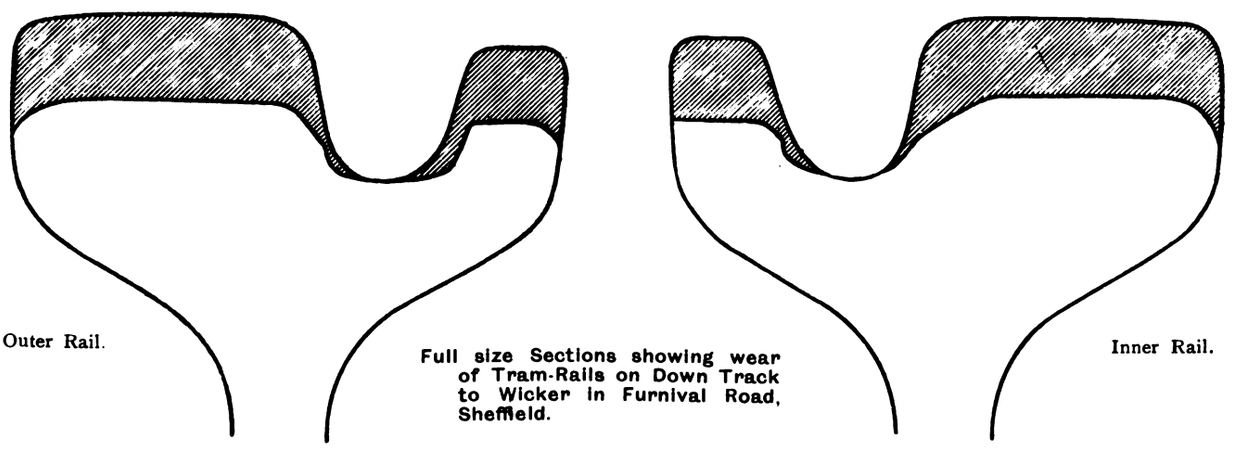
Digitized by Google

At the Edinburgh Conference of the Tramways and Light Railways Association, in 1911, Alderman Wm. Ivey, of West Ham, in a paper, made the following suggestions:

> "*(f) Amendment and Revision of Clauses on Track Maintenance and Cleansing, etc.*—These clauses were provided for the days of horse and mule traction, and were then fair and equitable to a certain extent. There can be no justification for the continuance of what is now a glaring injustice. I raise no complaint as to the obligation to construct the permanent way and track, but suggest that, having done that, the only further charge against the tramway should be the difference between the annual cost of repairs of the paving nine inches on each side of the rail and the surface generally of the whole carriage-way. I admit that, owing to the presence of the rail and the difficulty of making and keeping a good joint between rail and road, there is a considerable difference in cost; therefore the tramways should pay *that* and no more, but would in all cases make good, after opening up for rail or bond repairs.
>
> "*(g) Rating.*—Tramways and light railways to be rated as railways at one-fourth of rateable value."

The question was raised again at your Glasgow Conference the same year, and you will all remember Mr. Blain's remarks in his presidential address last year.

Of the two causes for agitation in favour of the revision of the Act of 1870, No. 1 hardly needs argument—it is self-evident. No. 2 is "where the shoe pinches," and it hurts more in some places than others. The enormous increase of motor-drawn vehicles in recent years has revolutionised street traffic, and, altogether apart from private cars (which I do not think are an important factor in the case), commercial motors—both steam and petrol—with trailers, heavy loads and high speeds, have caused increased wear and tear, and consequently heavier burdens upon tramway undertakings in the maintenance of paving within the statutory area of their tracks. This has affected local authorities in other streets and roads besides those used for tramway purposes. To such an extent has this affected the general construction of road paving that the Metropolitan Committee on Materials and Means of Paving the Streets of London report that the depth of concrete foundation has had to be increased from 6 in. to 9 in. and even 12 in. in some cases.



**Full size Sections showing wear of Tram-Rails on Down Track to Wicker in Furnival Road, Sheffield.**

In a paper read at the recent annual meeting of the Institution of Municipal and County Engineers, our highway surveyor, Mr. W. J. Hadfield, specially referred to the increased cost of road maintenance by heavy steam traction in different classes of streets, and this has, without doubt, seriously affected tramway tracks, as well as streets without tramways. Apart altogether from the fact that the trams do not contribute to the wear and tear of the paving, there is also the important fact that in nearly every case far more vehicles than tramcars use the same street.

To quote two local instances: In Furnival Road (near the Victoria Station) in a recent 24 hours' observation there were 3,327 vehicles proceeding in the same direction as the *down* track, and only 137 tramcars during the same period. Those 3,327 vehicles were spread over every portion of the available road not occupied by the *up* traffic. The *down* track referred to is very little used by tramcars, but the result to the rails—apart from the paving of the road—is shown by the full size section given above, kindly supplied by the highway surveyor. In High Street, where the largest number of trams pass to and fro, there were on an average day from 6 a.m. to 9 p.m. 3,494 vehicles (excluding bicycles), as against 2,940 tramcars, or 554 more, but this was in a wide street, where the tram tracks are not so much used for ordinary vehicular traffic as in narrower streets. In this case the carriage-way was 50 ft., and in the former case 31 ft. wide only.

Mr. A. L. C. Fell has kindly supplied me with two typical cases in London from 8 a.m. to 8 p.m.

In Queen Street, Hammersmith, there were 336 electric cars and 4,140 other vehicles (excluding bicycles), including 973 motor 'buses. In Lea Bridge Road there were 547 electric cars and 2,522 other vehicles, including 771 motor 'buses.

Cases such as the above, if they do not provide an unanswerable argument in favour of the repeal or amendment of Section 28 of the 1870 Act, do provide good reasons for a searching enquiry into the operation of the clause with a view to revision. I am not able to lay before you to-day the cost of maintenance of tramway tracks in this country, but if I could, I venture to think the result would be startling.

But if you will carefully consider the figures I supply in appendices to this paper (figures which in some cases include permanent way, and from which a deduction of 50 per cent. may be taken as an extreme figure for rails, bonds, joints, and fish plate renewals and maintenance) you will have amounts which speak for themselves and need little further comment. If you also refer to the figures quoted in THE TRAMWAY AND RAILWAY WORLD for July 11, 1912, you will find that for the 16 municipal systems given in Appendix "I." it amounts to £132,584 per annum for maintenance of permanent way, and £123,787 per annum for rates, sufficiently startling figures to be worthy of the most careful thought and consideration. In the appendices I also give the cost of repairs and maintenance of permanent way, and rates on same, per mile of single track of a few of the municipal systems upon which some of the totals referred to above are founded.

The decision of the House of Lords on July 24 last, in the Tottenham Urban District Council's rating appeal in connection with the Metropolitan Electric Tramways, Limited, has accentuated the sense of injustice which tramway concerns feel in connection with this subject. In our own city it has caused an increase of over £4,000 on the rates for the present year. The rating of tramway tracks is practically a rent for the "partial monopoly"—if I may use the phrase—of a portion of the street, and if assessed under Section 211 (1) (b) of the Public Health Act, 1875, in the proportion of one-fourth only of the net annual value, gives a very handsome rent to the local authority. But if, in addition, it not only keeps in repair the larger area of the road, and out of its profits relieves the rates—and in some important cases pays a proportion of the cost of street improvements—the argument for reconsidering the present state of the law becomes much stronger.

*The Times*, in a leading article on August 23 last, dealing with the motor omnibus question, sums up the position in an able and impartial manner which should appeal to all reasonable minds:

> "It is true that the omnibus companies do already contribute to a certain extent to the upkeep of the roads. They are rated on their garages, and they pay a petrol tax amounting to about £40 per omnibus per annum. The disposition of the produce of this last tax, after it has passed into the hands of the Road Board, is a matter that is obviously not under their control. If the money that is paid for petrol consumed in Piccadilly or Peckham is spent in the improvement of roads in the provinces, that is no concern and no fault of theirs. Their case is that they pay the tax, and that it might be used more largely than it has been for the reduction of the rates in London. On the other hand, they are not rated to the same extent as the Council's tramways, and some adjustment of the inequality between the two chief forms of public locomotion in the Metropolis is undoubtedly called for. The motor omnibuses are just as much 'the people's' conveyances as the tramcars. *But there is no reason why the concern run by the municipality should be handicapped in comparison with that which is the property of private companies. They should be placed on an equal footing, always keeping in view the fact that both of them exist primarily for the convenience of the public.*"

Let me summarise the arguments for and against the repeal or revision of Section 28 of the Act of 1870.

Digitized by Google

**REASONS GIVEN FOR REVISING SECTION 28 OF THE TRAMWAYS ACT, 1870.**

1. The Act was based upon the use of horse traction only, involving wear and tear of the paving by reason of the method of haulage provided.
2. In recent years the form of traction has completely changed, and systems unthought of in 1870 have been adopted throughout the country.
3. Electric traction causes no wear and tear to the pavement, except against rails when becoming loose or worn down.
4. Tramways pay whole cost of paving, both initial and annual, and usually of a better class than would otherwise be the case.
5. Tramways are rated not only on their depôts and offices (a portion of which goes to maintain the streets generally), but on the whole of their track, whilst motor 'buses and all other vehicular traffic are rated only on their buildings, which often represent a very low capital expenditure and annual value.
6. Some tramways contribute towards the cost of street improvements, to which all other increased traffic pays nothing—except, as do the tramways, in the rating of their buildings and machinery.
7. Track paving is seriously damaged by both heavy and light motor traffic, in addition to horsed vehicles, and the cost of repairs is annually increasing.
8. The decision of the House of Lords referred to above imposes a greater burden of rates.
9. Many tramways, in addition to their rates, contribute large sums towards the relief of the rates and other public purposes.
10. Largely increased rateable value of surburban and central districts over and above any depreciation which may be attributed to them on line of route.
11. Improve the public health by cheap and rapid transit to the suburbs, enabling the workers to live in a better atmosphere, and thus help to solve the housing problem.
12. Save local highway authorities large sums per annum in repair and maintenance of streets.

**OBJECTIONS TO REVISION.**

1. Tramways "monopolise the streets" and divert traffic on to other streets.
2. Cause increased wear on the sides of tracks.
3. In most cases contribute nothing to street improvements.
4. All vehicles pay in their rates their share in the general up-keep of the streets.
5. Any revision of powers which would relieve tramway undertakings would increase the burdens of local authorities not owning tramways, and in cases of municipally owned tramways would add to the cost of highway committees.
6. Any such relief where tramways are municipally owned would only be a case of "taking it out of one pocket and putting it into another."
7. No material saving to highway authorities, owing to increased traffic diverted by tramway track.

**REPLIES TO OBJECTIONS.**

1. Tramways do not "monopolise the streets." The figures already stated for London and Sheffield are typical of and could be repeated in scores of other towns, all of which tend to disprove this assertion.
2. Whilst in some cases increased wear and tear does take place at the sides of the track, this is by no means universal. Careful observation has shown that thousands of vehicles, especially fast moving, use the tracks on account of the easier traction. In some places the camber of the roads encourages this usage, whilst in many cases there is no appreciable distance between the track and the kerb to allow of vehicular traffic forming its own track and adding to the maintenance of the sides.
3. This may be correct in most cases, but neither does the increased traffic caused by the development of petrol and steam motor traction pay anything towards the wider streets necessitated as much by *their* traffic as by tramways.

   The London County Council, which has been hit so hard by motor omnibuses—both in their revenue and in the cost of maintenance of paving—is paying (up to March 31 last) on a sum of £607,743 for street improvements. Sheffield, up to the same date, has paid a sum of £61,898 towards service of debt for street improvements, representing interest and sinking fund charges on £190,473.

   For the last financial year Manchester paid the sum of £5,115 by way of interest and sinking fund on an amount of £113,975 allocated for street improvements (see Appendix "B," page 323).

   So that in addition to the rating of the track, which in itself contributes to the cost of street improvements, some municipalities pay special contributions whilst other vehicular traffic pays nothing.
4. Agreed that everybody (even those living in "unadopted" streets) pay in their rates towards the maintenance of street improvements, but this argument is good only up to a certain point. For many years the law has provided that payment shall be made for extraordinary traffic, and it can be and is argued that streets which were originally paved for, at most, heavy horse-drawn traffic were not constructed for the heavy motor traffic which has appeared in recent years. The State has further recognised this principle in the petrol tax, which is intended to assist in the strengthening and improvement of roads necessarily brought about by the enormous development of motor traffic. Unfortunately the yield of the tax is not appropriated to the district where the increased cost of maintenance is necessitated, and probably this allocation would be difficult. Certainly no tramway authority has received any contribution towards the increased cost of their track repairs. A writer in *The Times* on August 22 suggests "that the exemption from horse-power duty which was created by Section 86 (3) of the Finance (1909-10) Act, 1910, be abolished," meaning, I take it, that motor 'buses and other hackney carriages should, as well as other vehicles, pay the increased duty imposed by the Act. The increased duties then payable might form a fund which should be placed at the disposal of the local authorities, and a certain portion of it allocated towards tramway track repairs.

   Parliament has also again recognised this principle of extraordinary traffic this year, *inter alia*, in the Brighton and Hove Omnibus Company's Act and in the Chesterfield Corporation Act—the latter authority having to pay one-third cost of widening roads and all extra cost of road maintenance due to motor 'buses and trackless trolley vehicles, the roads having first to be put in satisfactory condition for the present traffic.
5. This objection touches a tender spot and appeals more to the selfishness of human nature than to the principles of equity and justice. Municipalities *should* represent the true spirit of enlightened democracy, and one can find nothing in the principles of democratic self-government which can put equity and justice in the background as matters of comparative unimportance. It is perfectly true that in some cases municipalities do not own their tramways, but that is a condition of affairs which is altering year by year—where it will pay to acquire the system.

   Nobody can deny—in view of the acquisition of tramways by municipalities during the last decade or so—that the tendency is strongly in the direction of municipal ownership, and this tendency is likely to increase rather than diminish in the near future.

   But dealing with the question on its merits, we might repeat the old Latin phrase, "Let justice be done if the heavens fall," and although this is a contingency which may hardly be expected to happen, the sentiment is one which may well express the feelings of all just and upright men of sound judgment and reasonable opinion.

   With regard to the position of highway committees, any extra cost which might be involved in taking over part of the maintenance of the tracks would be met by the increased contributions to the rates which in most cases would be expected. But even if this result was not attained, the principle remains the same.
6. This objection is specious and unsound. To quote Councillor C. F. Spencer on a previous discussion of this question, "every tub should stand on its own bottom." Municipal trading has to undergo keen scrutiny and criticism on all hands, and perhaps rightly so. It is only equitable, therefore, that these concerns should be worked upon strict commercial business lines, and should not only be debited with every legitimate outgoing, but credited with every reasonable source of revenue. There should be no "lading and teeming" or "robbing Peter to pay Paul," but all municipal trading concerns should be conducted on lines of sound financial principles, and whether it be tramways, markets, water, or electric power, should show its actual losses or gains in its annual financial statement just as all great private companies do in theirs.

   It is no satisfactory answer to say "it makes no difference in the long run," because—*first*, the statement may not, and in many cases would not be true; and, *secondly*, the result does not show the real financial state of the undertaking.
7. The last objection has probably more to be urged in its favour than any of the others. But it would be difficult to estimate how much additional traffic is put on other streets in consequence of tramway traffic. Close observation in several towns has failed in most cases to show anything like a large percentage of displaced traffic, and it appears to have affected the sides of the tracks more in wide streets than to have permanently taken traffic altogether away from tramway routes.

*In conclusion*, assuming that the present application of Section 28 of the Tramways Act, 1870, is inequitable, what are the suggested remedies:

(*a*) Differential rating on the basis of one-fourth the net annual value, or

(*b*) The reduction of the cost of track maintenance to tramway concerns by one half, the local highway authority paying the remainder, or

Digitized by Google

(*c*) By both "(a)" and "(b)."

(*d*) By the repeal of the exemption under the Finance Act, 1910, referred to previously, and the formation of a fund by which local authorities shall be allocated proper proportions of the yield of the tax towards road maintenance on tramway as well as other routes.

(*e*) By the repeal of the 5th Schedule, Part 1, of the Finante Act, 1910, except paragraph 4, thus allowing the rebate on petrol to medical men only, and the payment of the increased duty to the proposed fund referred to in (*d*) above.

The proposals (*d*) and (*e*) would then provide that those who mainly use the roads, or who chiefly contribute to their destruction, would then pay directly towards maintenance and renewals.

Whilst highway authorities are responsible for the general upkeep of the roads (except as exempted by Section 28 of the Tramways Act, 1870), it will be only reasonable that if the burden now placed on tramways is wholly or partly transferred to the highway authorities, there should—in view of the enormous change in the character of the traffic—be some relief from imperial sources. This principle is already recognised in the grants from the Road Board, but the amounts so allotted should be considerably increased.

These suggestions (whilst they do not by any means comprise all that could be advanced) are put forward, like the rest of the paper, with a view of providing an opportunity of discussing all sides of this debatable subject, and in the hope that it will lead to the satisfactory solution of a difficult problem which is daily becoming more urgent in its need for settlement.

My acknowledgments are due, and are gratefully tendered, to the following gentlemen for the valuable information supplied and the assistance given in the preparation of this paper: Messrs. A. R. Fearnley (President M.T.A.), Sheffield; A. L. C. Fell, London; J. Dalrymple, Glasgow; J. B. Hamilton, Leeds; J. M. McElroy, Manchester; W. J. Hadfield, Sheffield; H. England, Wakefield; A. de Turckheim, London; and W. H. S. Dawson, Bradford.

## AN EXPLANATORY NOTE ON THE CAPITAL COST AND MAINTENANCE OF PAVING IN THE TRAMWAY AREA.

The figures given in the table attached hereto represent the estimated saving to the road authorities (that is the Borough Councils) of London, owing to the tramway authority (that is the County Council) constructing and maintaining the paving and foundations of the tramway area.

The amounts have been obtained by estimating the debt charges on the cost of constructing the foundations and paving within the tramway area, based on the assumption that tramways did not exist and that the whole of the roadway was paved in the same form as the crests are at present. To this is added the cost of maintenance for each year.

The period of repayment for all foundations has been taken at 30 years. The life of granite paving has been taken at 20 years, and hard wood paving at 10 years. The area of each type of paving varies in the different districts. An average has, therefore, been taken of the whole system, which gives a figure for capital charges and maintenance of £875 per mile for electric traction, and £580 per mile for horse traction. The difference between these amounts is due to the greater length of single line on the horse car routes.

## APPENDIX "A."

### LONDON COUNTY COUNCIL TRAMWAYS.

Financial benefit conferred by tramways on road authorities as compared with motor omnibuses for the period of five years ended March 31, 1913.

TRAMWAYS.

| | Year. | £ | Totals. |
|---|---|---|---|
| Rate on tramways (*i.e.*, payment for the use of roads). | 1908-9 | 35,043 | |
| | 1909-10 | 43,904 | |
| | 1910-11 | 49,406 | |
| | 1911-12 | 98,526 | |
| | 1912-13 | 98,293 | |
| | | | 325,172 |
| *Maintenance and renewal of permanent way (*i.e.*, the estimated saving to road authorities owing to tramways). | 1908-9 | 93,738 | |
| | 1909-10 | 107,515 | |
| | 1910-11 | 118,000 | |
| | 1911-12 | 122,772 | |
| | 1912-13 | 125,486 | |
| | | | 567,511 |
| Total rates, renewals, etc. .. | .. | .. | £892,683 |
| Workmen carried at cheap rates | 1908-9 | 37,985,254 | |
| | 1909-10 | 46,298,889 | |
| | 1910-11 | 55,786,620 | |
| | 1911-12 | 61,019,740 | |
| | 1912-13 | 63,649,057 | |
| Total .. .. | .. | 264,739,560 | |

* See special note to Appendix "B."

MOTOR OMNIBUSES.

| | £ | Remarks. |
|---|---|---|
| Rates for use of roads | .. *Nil.* | N.B.—As regards the petrol tax paid in respect of motor omnibuses this may be regarded as a tax on power, and corresponds to the rates, etc., paid on the tramway power-station and sub-stations. |
| Maintenance of roads | .. *Nil.* | |
| Total rates, maintenance of roads, etc. .. .. | .. *Nil.* | |
| Workmen carried at cheap rates .. .. .. | .. *Nil.* | |

## APPENDIX "A1."

### LONDON COUNTY COUNCIL TRAMWAYS.

ESTIMATED COST OF TRACK REPAIRS (ELECTRIC TRACTION).

| Year. | Estimated cost of paving repairs. | Cost per car-mile. | Miles of single track. | Cost per mile of single track. | Unit cost of paving repairs. |
|---|---|---|---|---|---|
| | £ | d. | | £ | |
| 1908-9 | 31,353 | ·235 | 168·4 | 186 | 2/6 to 3/- |
| 1909-10 | 42,990 | ·261 | 223·7 | 192 | " " |
| 1910-11 | 49,605 | ·261 | 243·4 | 204 | " " |
| 1911-12 | 50,398 | ·248 | 258·8 | 195 | " " |
| 1912-13 | 58,334 | ·264 | 267·0 | 215 | " " |
| Average .. | 46,576 | ·254 | 232·5 | 200 | " " |

## APPENDIX "B."

### MANCHESTER CORPORATION TRAMWAYS.

| Year. | Maintenance of Permanent Way. | Cost of Maintenance per Mile. | Rates. | Contribution to Street Improvements. |
|---|---|---|---|---|
| | £ | £ | £ | £ |
| 1909-10 | 16,371 | 98 | 38,498 | 4,048 |
| 1910-11 | 17,499 | 104 | 41,313 | 4,064 |
| 1911-12 | 15,344 | 90 | 42,901 | 4,056 |
| 1912-13 | 15,169 | 87 | 44,244 | 5,115 |

NOTE.—The cost of maintenance includes, in addition to the ordinary paving repairs, the cost in connection with the packing of the rails and attention to the rail joints and minor repairs to the points, etc.

## APPENDIX "C."

### LEEDS CITY TRAMWAYS.

MAINTENANCE COST OF PAVING TRACKS.

| Year ended March. | Total Cost. | Cost per Route Mile. | Rates Paid. |
|---|---|---|---|
| | £ | £ | £ |
| 1911 | 20,305 | 355 | 21,123 |
| 1912 | 19,995 | 324 | 17,601 |
| 1913 | 25,415 | 414 | 19,809 |

No contribution towards cost of street improvements.

NOTE.—The difference in the amount of rates paid for 1912 is accounted for by credit brought into account of £3,522, being a provision made during the previous two years for an increase of assessment of a portion of the undertaking when, on objection to the increase, after negotiation, was reduced to original figure, and in the year 1913 provision was made in our Revenue Account for £5,350, pending appeal claiming assessment as a Light Railway.

## APPENDIX "D."

### GLASGOW CORPORATION TRAMWAYS.

COST OF PERMANENT WAY MAINTENANCE FOR THE LAST FIVE YEARS.

| Year ended May 31. | £ | d. |
|---|---|---|
| 1909 | 41,120 | ·474 |
| 1910 | 39,877 | ·456 |
| 1911 | 55,248 | ·611 |
| 1912 | 56,864 | ·608 |
| 1913 | 74,071 | ·762 |

## APPENDIX "E."

### BRADFORD CITY TRAMWAYS.

ESTIMATED COST OF REPAIRS TO THE PAVING.

| Year ended March 31. | £ |
|---|---|

## APPENDIX "F."

### SHEFFIELD CORPORATION TRAMWAYS.

APPROXIMATE EXPENDITURE FOR THE FIVE YEARS ENDED MARCH 25, 1913, ON THE UNDERMENTIONED ACCOUNTS.

| Year Ended March 25. | *Repairs Account. Paving only. | Renewals Account. Paving only where Rails not Disturbed. | Total. |
|---|---|---|---|
| | £ | £ | £ |
| 1909 | 4,826 | 1,294 | 6,120 |
| 1910 | 4,626 | 1,924 | 6,550 |
| 1911 | 4,611 | 3,804 | 8,415 |
| 1912 | 4,527 | 594 | 5,121 |
| 1913 | 6,115 | 4,681 | 10,796 |
| | £24,705 | £12,297 | £37,002 |
| Annual Average | £4,941 | £2,459 | £7,400 |

* Includes items returned as Packing and Paving. Excludes Renewable Plate Work, Fixing Anchors, Winby Chairs, Galloway Joints, etc.; Relieving Drain Rails, Corrugations, Items charged to Repairs for changing Fittings, Rails and Castings.

COST OF LOCAL RATES ON PERMANENT WAY.

| Year Ended March 25. | Amounts Paid to Sheffield and Ecclesall Townships. | Amounts Paid to the Handsworth Urban District Council. | Totals. |
|---|---|---|---|
| | £ s. d. | £ s. d. | £ s. d. |
| 1909 | 9,475 12 10 | 11 15 0 | 9,487 7 10 |
| 1910 | 10,428 5 9 | 23 19 8 | 10,452 5 5 |
| 1911 | 10,461 7 5 | 56 10 3 | 10,517 17 8 |
| 1912 | 10,528 0 0 | 69 1 5 | 10,597 1 5 |
| 1913 | 7,048 1 0 | 41 13 5 | *7,089 14 5 |
| Totals | £47,941 7 0 | £202 19 9 | £48,144 6 9 |

* In consequence of the recent decision of the House of Lords, this amount will be increased during the present half-year by £2,105, or at the rate of over £4,000 per annum.

## APPENDIX "G."

### YORKSHIRE (WEST RIDING) ELECTRIC TRAMWAYS.

ROAD MAINTENANCE.

| Year. | Cost of Maintenance. | Per Mile of Single Track. | Cost of New Paving. | Per Mile of Single Track. |
|---|---|---|---|---|
| | £ s. d. | £ s. d. | £ s. d. | £ s. d. |
| 1907 | 2,454 6 9 | 60 15 7 | .. | .. |
| 1908 | 2,931 1 1 | 72 11 8 | 2,000 0 0 | 49 10 6 |
| 1909 | 3,168 1 1 | 78 9 0 | 2,500 0 0 | 61 18 2 |
| 1910 | 3,280 9 5 | 81 4 8 | 4,500 0 0 | 111 8 8 |
| 1911 | 3,556 2 6 | 88 1 3 | 599 9 11 | 14 16 11 |
| 1912 | 5,031 14 0 | 124 12 0 | *14,727 11 3 | 364 14 1 |

| Year. | Cost of Maintenance and Paving. | Per Mile of Single Track. |
|---|---|---|
| | £ s. d. | £ s. d. |
| 1907 | 2,454 6 9 | 60 15 7 |
| 1908 | 4,931 1 1 | 122 2 2 |
| 1909 | 3,668 1 1 | 90 16 8 |
| 1910 | 7,780 9 5 | 192 13 5 |
| 1911 | 4,155 12 5 | 102 18 2 |
| 1912 | 19,759 5 3 | 489 6 2 |

RATES.

| Year. | Local Rates Paid. | Per Mile of Single Track. |
|---|---|---|
| | £ s. d. | £ s. d. |
| 1907 | 451 8 9 | 11 3 7 |
| 1908 | 470 14 11 | 11 13 2 |
| 1909 | 525 2 7 | 13 0 1 |
| 1910 | 536 18 1 | 13 5 11 |
| 1911 | 540 6 4 | 13 7 7 |
| 1912 | 519 9 5 | 12 17 3 |

* As regards road maintenance, most of our track was coated with macadam, and the large sums expended show the yearly maintenance of macadam. Last year we resolved to pave entirely between the running rails with granite setts, and you will see that we have expended over £14,000 on this. We are completing the work this year and expect to spend another £18,000 on paving.

## APPENDIX "H."

STATEMENT SHOWING LOCAL RATES AND REPAIRS OF PERMANENT WAY PAID BY 34 TRAMWAY COMPANIES, 1912.

(Supplied by A. de Turckheim, Esq., Secretary, Tramways and Light Railways Association.)

## DISCUSSION ON COUNCILLOR FENTON'S PAPER.

Councillor C. F. SPENCER (chairman, Halifax Tramways Committee): The paper which Mr. Fenton has read to-day is an exceedingly comprehensive, lucid, and yet concise one. I remember once walking on Blackpool sands, and hearing a scissor-grinder indulging in the vernacular, and he said, "I come from a place where they settle their differences with half-bricks." I said "Where is that?" He said "Sheffield." (Laughter.) On this occasion Mr. Fenton has settled the question, to my mind, with whole bricks, and he does not give much opportunity to anybody to put the lime in between them. For the last eight years the Halifax Corporation Tramways Committee have considered this question very seriously, and perhaps after a few discursive remarks from me you will see we have reason to complain, and I am sure we, more than anybody else perhaps, are indebted to Mr. Fenton for the excellent paper he has submitted this afternoon. He has first explained the injustice of the section to which he has referred in the Act of 1870. He has explained the necessity for revision and the objections to revision, and then he has answered these objections. If ever there was ninepence for fourpence, he has given it to us this afternoon. (Laughter.)

To my mind this subject should be looked at from the business standpoint. It is not a question of how many Corporations have company tramways running through their district, but a financial question which should be determined from a purely business standpoint. There are many of us, I have no doubt, who—if we had company-owned tramways in our districts and looked at it from the point of view of the local exchequer—would say "We do not want any alteration;" but I venture to assert that, in these days of enlightened democratic government, if municipal tramway undertakings are to be accepted and to be a success, we ought to have our accounts placed on the most satisfactory financial basis possible, so that they would bear the keenest and healthiest criticism. That can only be done by each department realising its responsibilities, and the Council dealing with these things, not from the point of view of the exchequer, but entirely from the trading point of view.

What are the difficulties which beset us in a tramway department? First of all, we are rated at full. I see Mr. Fenton says: "When is a tramway a light railway?" The only answer is, "When it pays rates on one-fourth." What is the basis of the rating of tramways? I

Digitized by Google

venture to say that the basis of the rating of tramways is different from most municipal undertakings. We are rated on the ability to pay. If you are making a high profit your assessment goes up. If you are making a small profit, you try and get it down. But if a man owns a warehouse, and employs forty or fifty motor vehicles to distribute his goods, and in one year makes £500, and in the next year £10,000, the basis of the rating is not altered at all. But the basis of the rating of your trams, if you double your profits, is considerably increased, and consequently you are taxed on your ability to pay. That may be theoretically wrong, but in practical effect it is right. That is what is happening to all of us to-day; at any rate, to the Halifax Corporation, and I do not suppose there is any other authority better off than we are.

We want a revision on this question of rating. What do we pay rates for? For the right to run our tramways in one street only! The motor omnibuses pay no rates at all, and they have the right to run in any street, and although the competition does not affect us in Halifax, the fierce and unrestrained competition which the local authorities in London are meeting from motor omnibus systems is a matter which this Conference ought to take into account, and do everything they can to assist the London local authorities. (Hear, hear.) The London local authorities have to pay rates for running one way; the motor omnibuses go anywhere and pay nothing at all. Why should not the motor omnibuses be taxed on their ability to pay, and according to the amount of their receipts as a basis in the particular district in which they run? I think the local authorities are entitled to this, and ought to get it through, but we shall not get it out of this Parliament, because they have more things to do than look after local authorities. (Laughter.)

Then what about maintenance of track? Let me give our own tramway as an example. We are told we ought to maintain the highways because we mostly use them, and also because other vehicles have to take deviation routes. Our streets are very narrow, and we have double lines as frequently as possible, because we are advised it is best for the traffic generally to put down double lines where possible. We have carried through that policy, and with what result? That in some of our narrow streets we practically have to pave the whole of the road. The tramway authority has to pay for the paving of the whole of the road. Private motor cars do not contribute a penny; ordinary motor vehicles which deal with trade do not contribute anything, and the ordinary horse-drawn vehicles contribute not one iota. You may say, "Those people pay a portion in our rates;" so do we pay a portion in our rates for our tramway sheds, but I venture to say it is not right that the whole of the incidence should fall on us. It should be fairly distributed.

The only way I can suggest in which it should be distributed is that the tramway authority should bear the cost of paving and renewals for 9 in. on either side of the line, and the highways authority should charge them a mileage rate for it. What happens in our case? The Highways Committee select the granite setts or the Yorkshire stones and the cement, and find the men to carry out the whole of the work. Then they measure it up, send in their account, and we sign cheques for it, though we have no control over it at all. That is our position, and one to which we are compelled to submit. The Council says, "This is the highway authority; there is the section of the Act of Parliament, and we have to carry it out." We have no voice in the management, no control over the material, nor the manner in which it is laid. All we have to do is to sign our monthly cheque as they send in the invoice to us. That shows what a live business Corporation we are at Halifax. I would go one further and say that a chauffeur or driver of a motor vehicle would prefer to drive over the tramway track to driving on the road where there is a sufficiently wide road to do so, because it is better paved. The Highways Committee look after our paving very well. The driver also says, "I am much more secure here; there is less liability to accident in the centre than on the side of the road."

What are the Road Board doing? They are investing their funds, not for us, but for posterity. The Government looks always after posterity, I suppose because they have done so much for us. (Laughter.) They have invested something like three millions of money. Would it not be a charity if they could hand over three millions to us? We could spend it for them, and show them how to maintain tracks and roads. I do not think the Road Board are working on a right basis. If the income from the petrol tax or anything else of that character is to be rightly distributed, it should be distributed to the local authorities who know what is wanted in the districts, and not held up in London, and left to the chairman and officials of the Road Board to invest in Consols. It is all right for keeping up the price of Consols, but it was never intended for that; it was intended to help the local authorities. As to the distribution, what would be the basis of it I cannot say, but anybody who can create a national insurance scheme can deal with the very simple matter of how to deal with this fund.

What attitude does the Council take to the tramway department? When I read THE TRAMWAY AND RAILWAY WORLD and similar journals at the end of March, or at the time when estimates are being made, I find that the local exchequer looks upon the tramway department, if it is a financial success, as a sort of bank, upon which it can draw in case of need. In Halifax that need is always chronic—(laughter)—and the chairman of the Finance Committee naturally always finds a way of dealing with any surplus which the Tramways Committee may have; and I venture to think all of you are in the same boat, even including Sheffield. In our great cities, such as Leeds and Bradford, they have huge profits, and they do not miss £10,000; but we in Halifax think £10,000 is a gold mine. Out of our capital outlay of £413,000 we have repaid £114,000 by the operation of the sinking fund, and we have a renewal fund of £27,319, but that is not sufficient to deal with all possible renewals. When a track has been down for fifteen years, you want a huge fund to renew it. You want to renew the paving and the rails, and I venture to say that this policy of the exchequer nibbling at your funds is one which is not going to assist small undertakings like ours. We pay in rates £3,250 a year. It may not be a big figure when you consider that our profits are anything from £12,000 to £18,000 a year. Then we pay in road paving £5,000 a year, and we give in relief of rates—or, rather, we do not give it; it is taken from us—£7,181, which comes out of our banking account. The result is a total of £15,431, which is actually disbursed to the local authority out of our income, representing 15 per cent. of our total. I can imagine somebody may say, "Why are you so foolish in giving this £7,181?" (Hear, hear.) You forget the old motto, "Good Lord deliver us!" (Laughter.) If you were at Halifax, you would know what we have to deal with. We have no option. They set up the basis, and many towns are setting up the basis, that you have to pay 1½ per cent on your capital outlay.

A DELEGATE: Quite right.

Councillor SPENCER: But what if you have not got that 1½ per cent. to pay? I agree with some percentage being given to the local authority, because we use their credit and borrow more money by having the credit of the Corporation behind us, but do not let us forget that we pave the roads, and we are yet called upon to pay 1½ per cent. on our capital. Is the value of the money worth 1 per cent. to us? I venture to say it is a hypothetical basis, but if it is worth 1½ per cent. on the capital outlay, why should it not be the reduced capital outlay and not the original capital outlay? Why should we have to pay next year 1½ per cent. on the debt which we have redeemed? We have redeemed £114,000, but because the exchequer wants the money we have to pay 1½ per cent. on the £114,000 actually redeemed and the loan discharged, and that is supposed to be fair trading. If you take the rating, our rates have gone up this year to £3,990. That is not on account of the recent decision, but because our assessment has been increased much; because we are making greater profits than we used to do. You are told you ought to pay for road improvements. Why should the tramways department pay for the road improvements any more than motor vehicles or a hansom cab? We pay for the right to run, we repair the roads over which we run, and hand over the profits. The £7,181 which we hand over is equal to 4½ per cent. interest and sinking fund, on £160,000, and £160,000 in improvements goes a long way in our town. Do they forget what the tramways have done? As Mr. Fenton said, they open out new districts and bring in new rateable values. We are not like Blackpool; they have a special front to run on. We in Halifax cannot afford a special roadway; we have to open new districts and bring about an increase of rateable value. We heard at lunch time of the housing difficulty which the tramways help to solve, and I venture to say the housing difficulty has been partly solved in our town by taking the people into the country districts. We have cheap fares, and men can go back home at noon and get a dinner at home instead of having to pay for it in town. Tramways have enabled men to live outside the town instead of in the squalid centres. What is to become of your garden city schemes if you are not to have a tramway near? A tramway is one of the adjuncts to garden city schemes. Then we take half the output of the electricity works, and pay 1/8d. a unit for our current, and the manufacturers get it for a halfpenny.

How are these things to be remedied? I have some sympathy with the Corporation which says, "We must have as much profit from the tramways department as possible." I have some sympathy because Parliament is putting on us national impositions which have reached the breaking strain, but the time has come when local authorities should resist these impositions. How are we to resist them? You go to your own member of Parliament—I am not speaking of my own—and begin to discuss these things with him. He says it is only taking it out of one pocket and putting it in the other, and that it amounts to the same thing. I venture to say it does not, and your town members do not appreciate the work which is being done by municipalities. Perhaps, if they do appreciate it, they are not so assiduous in helping municipalities as they ought to be, and we know county members are antagonistic to local authorities.

The only way is to have a sort of municipal Parliament, a scheme similar to the British Association, with a central executive committee which represents every organisation connected with municipal work. If you had a big authority like that, which met one week in the year and discussed all these matters with all the weight of municipal influence, an association of that sort would make itself felt in Parliament; and when we show Parliament that we are united, and are all

Digitized by Google

intent on having an alteration in the law, then Parliament will move; but so long as one is quarrelling with the other as to the right thing Parliament will not take the slightest notice of us.

I think the paper submitted by Mr. Fenton is one of those practical papers which should help us to come to a decision in this matter, and when we come to that decision, we ought to stand loyally by it, and do our best to get a remedy. (Applause.)

Mr. R. W. SMITH-SAVILLE (borough engineer, Darwen): After Councillor Spencer's speech I almost wondered at anyone (unless either a tramways manager, or at least a member of a tramways committee) having the temerity to venture along a public highway if it contained a tramway, for according to his views it appeared to have the monopoly of right there, and everything else must give way to it; certainly the Highways Committee, to whom legislation had given the administration of the road should have no authority there. Now we all know that tramways spend a big sum on the maintenance of track. In Darwen we are on the heaviest motor traffic road in Lancashire, between the busy manufacturing centres of N.E. Lancashire and the Manchester Ship Canal Docks, and although ours is not the nearest route to the Liverpool Docks, the bulk of the heavy motor traffic comes our way because the roads are better. Twelve years ago we had steam tramways (single track only), and our main road then cost us £342 per mile. Now, although the tramway track has been doubled for its entire length, the road costs us £891 per mile. This is entirely due to the advent of heavy motor traffic, so that notwithstanding that the tramways are now responsible for over double the paving area previously the highways cost has been increased almost three times, so that tramways do not appear to have relieved that department much.

Now take the case of the tramways, formerly in the days of the old steam traction with heavy engines the cost was £70 per mile of single track, when electric traction was introduced the lines were relaid, and after six years with ordinary traffic the cost was £59 per mile, with the introduction of heavy motor traffic it jumped to £80 per mile. It has increased annually until for the present year it is costing nearly £200 per mile, and if the repairs were not under the borough engineer it would cost more, in fact the cost is such an awful lot that one is ashamed to send the bills in. The impression seems to be, according to some, that when the borough engineer has nothing else for his men to do he sets them on tramway work to find them employment; but I assure you he has of necessity often to keep men there when he would much rather they were elsewhere. I admit that the tramways paving is in a better state of repair than that outside—and this must be so, for the reason that it is alongside the rails themselves. We are satisfied that if we do not keep the paving in a high state of repair we shall get our rails and joints broken by the heavy motor wheels coming across and striking them like a sledge hammer, therefore, they must not be left projecting.

With ordinary highway paving you can afford to lose some of the camber, because its level is not fixed by that of the rails, and you do not have traffic running on defined lines and making tracks of its own, but where tramway lines are, especially if double, the traffic follows not only against the rails but on defined lines between them and the kerb, and the natural tendency of horses—and I drive 10 miles a day—is also to follow on the defined lines set by the rails or the space between the rails and kerb, so that certain narrow portions of paving get undue wear, and if left would form hollows; this causes excessive cost to both departments. I do not think there would be cause to complain of the ordinary traffic if it were not for the heavy motor traffic, and I think a resolution passed by the Conference should be sent to the Chancellor of the Exchequer and the President of the Local Government Board, protesting against the maintenance put upon us since the heavy motor traffic came into use, and urging that we should have some special grant from the Exchequer.

The MAYOR OF ROCHDALE (Alderman Wm. Cunliffe): I thought Mr. Spencer covered a very wide area in opening this discussion, and he introduced some problems which could very well be relegated to the Municipal Corporations Association in London, instead of this Conference being called upon to deal with them. I think you have a very contented Tramways Committee in the Halifax Corporation, and I wish to ask whether, instead of sticking to the strict Act of Parliament, there is not some arrangement which could be made between the Paving Committee of your Corporation and your own Tramways Committee with relation to the paving which is needful owing to wear and tear of the track. We have exactly the same difficulty in our own Corporation; but we have made arrangements with the borough surveyor and our own manager to see what portion of the track calls for repairs, and when both are agreed, then the Paving Committee furnish the new setts without charging the Tramways Committee with the cost. The putting down of the new setts, and reinsertion of the old ones, and making the paving good again, will be charged to the Tramways Committee. This arrangement is working very amicably between the two committees, and I have no doubt such an arrangement might be made by the Halifax Corporation itself.

Mr. Spencer asks why the motor vehicle should not pay for the improvement of the road and the widening of the road? Do not the motors pay by the petrol tax? (Cries of "No.") I had occasion lately to interview Sir George Gibb of the Road Board concerning matters in our own borough, and he generously met us with a handsome contribution towards improvements we needed, which will usefully serve our tramway purposes as well as all other vehicular traffic on the roads. The great point is that the Road Board are assisting county authorities very largely. Since this budget was passed by the Chancellor of the Exchequer, they have disbursed large sums of money to the county authorities, and are now recognising county boroughs, and large sums of money are being voted for the permanent improvement of the roads which is rendered necessary by this heavy traffic which now uses them.

The DEPUTY MAYOR OF CROYDON (Alderman J. Trumble, J.P.): I should just like to intervene for one moment in the discussion. Reading the paper by Mr. Fenton, it seems to me we have to consider—rather than the particular affairs of Halifax or the town which our good friend who has just spoken represents—the broad principle as to the repairing of the tramway track and who is to pay for it. The matter, as far as I understand the paper, is rather a disagreement between the tramways management and the highways department. Even that you can reply to by saying that the local ratepayer—not the taxpayer generally, but the local ratepayer—is not particularly concerned in regard to that. Of course, as a business undertaking, no doubt we should see to it that everything possible should be placed to our credit, and that every possible charge wrongfully put upon us should be removed. At the same time it would not really affect the ratepayers of our towns whether the highways department paid for the maintenance of the track between the lines, or whether it was paid out of the revenues of the tramway department. When we have a profit, the Finance Committee take it; it is only taking it by a roundabout way from the highways department. The other alternative is that you can equalise matters by taking away the charge, or putting a tax on other vehicles. Motor 'buses seem to be in the minds of some gentlemen here. If you tax the motor 'bus, that would equalise matters to some extent, but there again you would have exceedingly great difficulty. Taking the place I represent—Croydon—where we are feeling motor 'bus competition in a very severe form. When you begin to talk about taxing motor 'buses you are up against a very big proposition indeed. It is a very difficult problem. Why should we tax the London General Omnibus Company's motor 'buses, if we do not tax the motor vehicles of Harrod's Stores, the Civil Service Stores, and every other stores in London? Then, if we tax them, why not tax every trader in our town? We have these difficulties to face, and it seems to me if you are to tax vehicular traffic, the only way is to go back to Lord Goshen's wheel tax, and tax every wheel on the road, and then you would have a fair proposition. Although in Lord Goshen's day it was withdrawn, perhaps to-day it would be acceptable, but I hope we shall try to discuss it as a matter of principle. As far as I know, it is not worth discussing as a matter between the Tramways Committee and the Highways Committee, because the money comes out of the pocket of the local ratepayer. It would be preferable to discuss whether it is better to equalise things by taking the rate off the tramways, or putting it on to motor 'buses, as the case may be. It is a very difficult problem, and I am sure this Conference would do well to discuss it on broad lines.

Bailie ALSTON (Glasgow): I agree entirely with the last speaker. It is not a question between various committees of a Corporation that we are here to discuss, but the general principle as to where taxation ought to be placed, and I think every business man to-day differentiates between a concern which earns its revenue in the streets or highways, and a concern which merely uses the highways for the conveyance of merchandise. I think there is a difference. In the one case it is essential to the company earning its revenue; the roadway is just as essential as the 'bus or motor itself. (Hear, hear.) That being so, there is a difference between them and the wholesale firm of merchants who only use the road for the transport of goods, and who may be rated at a very much bigger rate on the premises they occupy than the premises that shelter the 'buses over-night.

From that point of view, I think we are entitled to expect some differentiation in the rating of those 'buses. A friend of mine, who is living in Essex, told me that they have cut up the roads round his district to such an extent that the local ratepayer is practically refusing to pay rates, saying they are cutting up the roads without paying a single penny to the rates. That ought not to be, and there ought to be some means of getting at these people and making them pay a fair proportion towards the maintenance of the road. The tramway department has to do that, and pay the full value. I know in Glasgow we have to pay something like £67,000 per annum for local rates, and maintain the roadway over and above that. If a 'bus company came, what they would pay upon would be the places they shelter the vehicles in. We should have to maintain the streets they used and got the profits out of.

But there is another aspect in connection with the 'bus traffic in large centres of industry, which has not been touched upon to-day, and which I think ought to be noted. Not only do they use the highways for the accumulation of wealth, but they use them in a very reckless and dangerous way—dangerous to the public safety. I venture to say

Digitized by Google

they are becoming more dangerous each day almost. Mr. Fell, I imagine, could inform us of that. I find in a return I have in my hand that within five years the deaths or fatalities from the London 'bus have doubled. I find that in 1907 there were 1,200 'buses in London; they killed 35 people, which is equal to one for every 34 'buses. But in 1912, we have 2,400 'buses, killing 138 people, or one for every 17 'buses. That is not all. Comparing the rate with the tramways in London, we find that the London County Council tramways carried 821 million passengers in 1912, and that their death roll from fatalities by accident was 34, which means a fatality for every 24 millions of passengers carried. The London 'buses in the same period carried 400 millions and had one fatality for every 3½ million passengers carried. That is a point of view which I think local authorities, and all interested in humanity apart from the question of gain, ought to consider, and see that it is put a stop to. Not only should we make them pay more, but see that they are conducted in a less reckless fashion. These 2,400 'buses only carried 400 million passengers, but what a congestion to carry that number. Our vehicles in Glasgow, 800 in number, carried 311 millions in the same period, and there was less congestion from the 800 vehicles than the 2,400. Then we come to another point. We are practically losing control of our highways, and so congesting them that they are becoming dangerous, and the sooner the local authorities take control and run the 'buses, if they are to be run, the better it will be for all concerned.

Mr. J. B. HAMILTON (general manager, Leeds Corporation Tramways): I think perhaps there is rather a difficulty in the minds of some of the members present in keeping within the limits which Mr. Fenton has set in his paper. In listening to the last speaker I was tempted to think that I had overlooked something, and that he was speaking on the paper which I shall have the honour to put before you to-morrow. I think after all it is a comparatively narrow matter—the incidence of rating upon tramways and maintenance of roads. It must be looked upon, I think, in some degree as a rental which is paid. Remember, this was not done yesterday. The Tramways Act was dated 1870, and whilst, as properly said by the writer of the paper, undoubtedly the question of road surface wear was in the minds of the legislators who framed the Act, when the change of traction came—which again in most cases was the subject of Parliamentary powers granted—the charges were continued, and I think it is somewhat late in the day—43 years ago now—to find that we have a tremendously unfair burden. It must be remembered after all that the tramways have got along with that burden, and I think practical men cannot dissociate from their minds the fact that a good deal of extra road wear does result from the presence of the rails.

I agree with a good deal that has been said as to the necessity of setting matters right. There is an inequality of conditions throughout the country where the heavy petrol and steam motor traffic is developing—inequality which, I think, forces upon us the necessity of considering what is fair to be paid by those using rail transit and those using the road generally. The urgency of this question is being focussed to the necessary point. Several times this matter has been brought forward by members of the Association; in company with my colleagues the members of the committee, we have considered it very fully. Until the frequency of these heavy vehicles became so pronounced, I think we all felt the matter largely academic, and we came to the conclusion that we should be driving a wedge between different municipalities with varying conditions in cases where we desired to have perfect unanimity of feeling, and we thought there was no necessity at that time to push the matter further forward. But I do agree that things have completely altered. In my own experience I have reports nearly every day from our permanent way engineer of shattered paving such as never occurred five years ago, and which is directly traceable to the extraordinarily heavy wear of many of our streets. I think it would be very advisable that this Association, whilst not passing a definite resolution, should make it clear that this question of the maintenance of paving which is placed upon tramway promoters should be considered along with the wider question which the late Conference—I think in June—placed upon the Executive Committee: that was, that having in view the inequalities in the incidence of taxation which were taking place all over the country as the result of the change of the methods of traction and the vehicles using the roads, the Executive Committee should be empowered to take action, in conjunction if possible with other bodies, so that a national and united effort should be made to place the matter before Parliament in such a form as would enable it to come under revision. The result of to-day's discussion should be, I think, that road maintenance as in Section 28, should become one of the matters included in the general resolution, and I should like to suggest that should be done.

Judge HALL (Leith): I think in the Act of 1870 we have authority to agree with the local authority to go in for the joint expense of repairing the roadways. In section 29 it says.

> "The road authority on the one hand and the promoters on the other hand may from time to time enter into and carry into effect, and from time to time alter, renew, or vary, contracts, agreements, or arrangements with respect to the paving and keeping in repair of the whole or any portion of the roadway of any road on which the promoters shall lay any tramway, and the proportion to be paid by either of them of the expense of such paving and keeping in repair."

If the road authority and the tramway committee are in agreement there is no reason why there should not be a friendly settlement of the matter under the Act of 1870. The Leith Tramway Committee only pay two-fifths of the road expenses. They pay for the whole of the rails and for iron track protectors, but the road authority pays for the granite setts, and we think that is equitable, because there is a very large dock traffic in addition to the general traffic of the town, and the Town Council think that the Tramway Committee should only pay two-fifths and the Road Committee three-fifths. In this very Act there is authority to make such an agreement ——

The PRESIDENT: Do I understand you to say that the road authority pay three-fifths of the cost of paving between the tramway track?

Judge HALL: We pay two-fifths and the road authority three-fifths.

The PRESIDENT: Of the paving between the tramway track?

Judge HALL: Yes, and I think there is no reason why the authorities should not agree together under this Act.

Mr. W. J. SQUIRES (London County Council): I am sure the Conference will forgive me if I do not divulge very much what is the feeling of the London County Council. While I admit it is rather a difficult position here in the provinces, in London we are confronted with something like 28 borough councils, and you will realise what is our position. It is very difficult indeed to confine this discussion to the paper which has been read. I desire to thank the reader of this paper and the opener of the discussion if only for one thing. There is a very strong touch of sympathy from this Conference with the Council which I have the honour to represent. I am of opinion that when we get the report of the Traffic Commission—I admit that only deals with London traffic for the presnt—but I do believe when we get that report, and when it is discussed by the London County Council there will be food for all the tramway undertakings of this country, and I am sure this Conference will express the hope with me that the result of that inquiry may be satisfactory.

As to the contribution to road maintenance—and here I only express my own opinion; I am not permitted to express the opinion of my Council—my opinion is this, that since the motor 'buses are doing as we are doing as a tramways undertaking—that is, endeavouring to supply the wants of the public, catering for the public and taking their fares, and making profits—they should contribute in some portion as we have to on the London County Council. (Hear, hear.) Of course there is a difference between the provinces and London. You are not confronted with that terrible opposition—I will not say "opposition," I would rather say "competition"—that we have from the motor 'buses, but surely if we have to pay because we are taking the public money, the motor 'bus company should pay because they are also taking the public money.

One of the delegates made a suggestion that if we did this we ought to tax Harrod's and the Army and Navy Stores, and such like, but may I draw this distinction? Messrs. Harrods are not catering for carrying the public, but the motor 'buses are, and they are carrying the public, and I venture to think that any reasonable man will be prepared to say that, not only in London but in the provinces, any competing authority who is catering in the same way as themselves should pay their fair contribution. In other words, may I say I honestly believe that with the tramway undertakings of London and the provinces given the same conditions as the motor 'buses are allowed to run under, we shall hold our own for all time.

The difficulties we have to encounter are very great indeed, and nobody knows them better than my chief officer, Mr. Fell. May I, in conclusion, say how pleased I am to be here, a representative of the London County Council in Sheffield, and to congratulate Sheffield on what I have seen. There is one other reason, and that is that Sheffield gave to us our chief officer, Mr. Fell. (Hear, hear.) I do not intend to say anything more than express my own opinion on one or two points, but I do honestly believe that when this report is fully discussed there will be something more for all concerned in tramway undertakings. (Applause.)

Mr. H. MOZLEY (manager, Burnley Corporation Tramways): Do I understand, Mr. Fenton, that you wish to put on motor omnibuses and motors generally a further tax beyond the £40 you estimate, because it represents about the sum per car for the maintenance of the tramway, and rails, and points and crossings? Would it not be better to get the £40 for highway purposes instead of letting the Road Board have it? The other portion of the paper, as to the maintenance between the Tramways Committee and the Highways Committee, I think is purely a domestic matter, and can be dealt with without going to Parliament, as has been proved by our friends from Rochdale and Leith.

The PRESIDENT: We have some visitors from the Tramways and Light Railways Association, who are very much interested in this question, though perhaps in a different way from the Municipal Tramways Association. If those visitors would like to express an opinion on this paper, we should be very glad to hear them.

Digitized by Google

Mr. H. M. SAYERS (Tramways and Light Railways Association): I am sorry Mr. England is not here at the moment, as he has had more experience than I have had recently. I have been in South America for the last three years, where the conditions are very different from those in England. There tramways are rather welcome, and although local authorities who give the concessions like to make a fair revenue out of us, that revenue is stated in our contract when we start, and we can take it or leave it as we like; we have nothing to grumble at afterwards. We do not pay for track repairs as a rule, though different concessions and contracts vary somewhat.

But as representing the Tramways and Light Railways Association, which has most of its members in tramway companies, I can say we feel this matter very keenly indeed, and as you can imagine by the way in which, with the assistance of the Association of Municipal Corporations, we organised the fight for the rating of tramways on the one-quarter rate basis, we are very much in earnest on the question of rating. Of course, we cannot expect municipal Corporations to take exactly the companies' point of view, but we hope you will fight the fight of tramways as tramways, because after all the fair working of tramways is a matter of public importance, and not only a matter of dividends or relief of rates. It is much more important that the public should have good tramway services, and that tramways should give the best possible service for alleviating the difficulties of density of population and other things of that kind, than that shareholders should make large dividends, or ratepayers get large relief of the rates.

On the question of rating, it was suggested by Mr. Spencer, I think, that tramways are almost the only concerns rated on the revenue basis. That is not quite the case. Besides tramways, there are gas undertakings, electric supply undertakings, water supply undertakings, and railways, which are rated on much the same basis, and I should like to point out that they are rated on this basis because it is on the rent that the hypothetical tenant would give for the hereditament, and it is in the hereditament that the trouble lies. It is suggested that motor 'buses should be rated, but they are not hereditaments and are not attached to the soil, and to get powers to rate motor omnibuses means that the whole basis of rating has to be revised and altered. That goes back to Acts of Queen Elizabeth's date, and it is a very difficult matter.

As regards maintenance of track, I do not see why tramways should be put under the injustice of the maintenance of paving besides their own rails. They do not wear anything but rails, and as to the suggestion of the imperfect joints between the paving setts and the rails putting larger wear on the paving, I think that is really a matter of the proper choice of material and workmanship. The attention the tramways undertaking have to give to the joints, the bonding and the substructure, ensures ample opportunity for making good after repairs.

Mr. H. ENGLAND (Tramways and Light Railways Association): Before speaking on Mr Councillor Fenton's paper, I should like to take this opportunity to thank you, Mr. President, for so kindly inviting me to be present at this Congress. I appreciate the compliment very deeply, and I can assure you I am delighted to have the opportunity of meeting my old friends and participating in your deliberations. Although Mr. Fenton states in his paper that Section 28 of the Act of 1870 has been discussed by the Tramway Associations on many previous occasions, still I do not think it is necessary for him to offer any apology for urging the attention of this Congress to what is becoming—nay, has become—a very serious and burning question. Owing to the rapid growth of heavy mechanically-propelled vehicular traffic, road maintenance charges are growing by leaps and bounds, and it is quite time we sought some measure of relief from the iniquitous burden imposed on us by this section of the Tramways Act. In other places I have stated my opinions on this question, and this morning I wish to urge this Congress to take a wider outlook. I think we cannot expect to secure any amendment to Section 28 without a general overhaul of the Act of 1870, which has by usage come to be regarded as the tramway charter, but which, under modern conditions, is in many respects quite obsolete, and which strangles the industry it was designed to encourage.

There are many other clauses, in addition to Clause 28, which should, in the interests of tramways generally, be amended. What many of us ask for is the amendment of the frontagers' veto, the amendment of the rating provisions of the Act, and the establishment of a permanent tribunal, composed of men having practical knowledge, to adjudicate upon all traction schemes, and report the result of their deliberations to Parliament. We want to be able to promote schemes more than once a year, as at present, and I see no reason why we should not be able to submit a scheme at any time, and thus save what often now amounts to the loss of many months. We want the Acts of 1870 and 1896 consolidated, the procedure cheapened, simplified, and accelerated, and if this were done I am quite sure there are many miles of route, at present not served by tramways, which could be equipped, and would be undertaken if it were not for the obstacles put in the way by the present tramway and light railway enactments.

The Tramway Associations meet every year in conference, and each year reference is made to the unsatisfactory state of the law, but, the conferences over, nothing further is done. If I were a member of this Association, Mr. President, I should move that it be an instruction from this Congress to the Executive Council to take steps as soon as possible to consider this problem, and to prepare a bill embodying all necessary amendments of the Tramways Act, 1870, and of the Light Railways Act, 1896; to consolidate the two Acts, and make provisions for the inclusion of clauses governing motor passenger vehicles and railless trolley cars, and to report to a special meeting of the Association. Unfortunately I am not a member of the Association, but I do hope that something tangible will be the outcome of Mr. Fenton's paper, and that we shall not be any longer contented to meet and make our annual grumble.

Mr. W. J. HADFIELD (highways surveyor, Sheffield Corporation): I must apologise for saying anything at this late hour, but I am here in a capacity which not many other people present occupy; I am the highways surveyor for Sheffield, and keep the tramway tracks in repair, and I do so without friction with the tramways department. I think in Sheffield the highways get rather the better of the bargain, not quite so much the best of it as in some Lancashire towns perhaps, because we have rather a different kind of paving. If the Highways Committee had to maintain the whole of the tramways track, it might cost £8,000 a year; on the other hand, if there were no tramways it would save a good deal in the sides of the track, but I should think the present saving to the Highways Committee would not come to more than £2,000 or £3,000.

There is one other point—the position of the Road Board. In some places the Road Board do not seem to have been approached at all, but in Sheffield we have done very well with them, and obtained nearly £30,000 in one form or another. One result is that we have now half a million square yards of tar macadam, and when motor 'buses increase and multiply you will find tar macadam is a very useful form of paving. That is an interesting point to tramway engineers and tramway people generally.

Councillor FENTON (replying on the discussion): I do not think I have very much to reply to, Mr. President. I was hoping to get some very severe criticism this afternoon, and I am afraid I have been rather disappointed. The only critic I have really is our friend Mr. Mozley, who generally criticises most people—(laughter)—and when he asks me the pointed question he has done I may remind him that I think I have said in my paper that I was not giving my own views, but the views which are urged generally, and I will not express any definite opinion about that, except to say that I should be quite satisfied with the present taxation of motor cars with regard to petrol if we could have our share of the money brought into the Road Board exchequer. (Hear, hear.) For instance, in Sheffield we are just having a grant of £17,000 from the Road Board, and no portion of that grant will go on our tramway track. I say no portion; it will be very small indeed, if any at all, but we may take it generally that no tramway authorities have yet received from the Road Board any of the proceeds of the petrol tax for the benefit of the maintenance of tramway tracks. I do think it is not so much a question between the highway and tramway authorities, but an imperial question, and I welcome Mr. England's suggestion that there should be a general revision of tramway legislation, and if possible a consolidating Act which will embody all that is necessary to deal with the subject. It would be for the benefit of every municipality from the tramways side and highways side, and especially from the ratepayers side.

I am very much obliged for the kind reception you have given this paper, and I hope the outcome in due course will be some amendment of the law, setting up a satisfactory position under which tramway authorities—whether municipal or company—shall be placed in the future, so as to give them a fair share of the earnings which ought to be theirs in competition with other concerns. (Applause.)

The PRESIDENT: I know it will be your wish that we should tender to Mr. Fenton our hearty thanks for his very excellent and instructive paper. (Applause.)

The motion was unanimously carried amid applause.

The PRESIDENT: Before this matter is finally disposed of, the Vice-President, who has been giving some consideration to the subject, would like to say a few words.

The VICE-PRESIDENT (Alderman H. Linsley, chairman, Salford Tramways Committee): You will excuse me perhaps if I say a word which deals almost entirely with Mr. Fenton's paper. I have listened with great interest to the paper, and also to Mr. Spencer's opening remarks, and I am in entire sympathy with both of them. But it struck me while listening that we have year after year talked this matter over, and made no practical effort to do anything. We can talk till doomsday, but without an attempt to do something it is of no use talking, and I have drafted a resolution that I thought might be useful in setting the thing going. I am not going to press my resolution, although some resolution I think ought to be pressed this afternoon; I am willing to vote for any other resolution which this gathering may think better. My resolution is:

Digitized by Google

"That this meeting is strongly of opinion that the time has arrived when a revision of Section 28 of the Tramways Act, 1870, should be made, as far as it affects tramways undertakings."

Mr England suggested another resolution, and Mr. Spencer I think has another, but I do feel it is a great injustice, which affects the tramways of Lancashire more than in the south, that we should have to maintain the major part of the road when we do not use it. I agree that we should put down a good track, but I think it is the duty of the Highways Committee to maintain it, because as Mr. Fenton said all these grants which have so far come from the petrol tax have not gone towards tramway undertakings, and I think that is not quite fair. I hope something of a practical nature will be done, and that the Executive will follow it up during the next year.

The PRESIDENT: I think it would be opportune to ask the Secretary to read the resolution passed at the Conference in London in June or the beginning of July, which also deals with this subject, so that we may see exactly how it stands.

Councillor J. H. RODGERS (chairman, Newcastle Tramways Committee): Is not this a question which should rather be dealt with at the annual meeting on Friday than in this open conference.

The PRESIDENT: Yes, but I think it is so closely connected with the subject we have been discussing that we should, if possible, focus our opinion a little now.

Councillor RODGERS: We could do that between now and Friday.

The PRESIDENT: If we leave it to nobody it will be nobody's business. It is too wide a subject to discuss generally, but the matter raised now by Alderman Linsley is really a local matter, and we may be told it is a matter for the Tramways Committee and the Highways Committee to deal with. I think it is time we focussed our ideas.

Councillor RODGERS: Alderman Linsley's resolution is not so comprehensive as that.

The PRESIDENT: I take it so.

The HON. SECRETARY (Mr. C. J. Spencer): This was passed on 1st July at an extraordinary meeting of this Association.

"That the Executive Committee of the Municipal Tramways Association is hereby instructed to take such steps as will result in general and more equitable legislation with regard to the whole question of road maintenance, and to act if and when necessary with other associations who may be moving in the same direction."

The PRESIDENT: That resolution empowers us to act with the Tramways and Light Railways Association, who are dealing with the matter. The question is being carefully considered there, and I think it is advisable we should act. Anyway, that special resolution indicates that it was dealt with at our special meeting in July. If there are any other opinions as to the way in which we should deal with it, I should like to hear them.

Mr J. M. MCELROY (general manager, Manchester Corporation Tramways): As one who has taken an active part in the discussion in years gone by, may I say a word? In 1907 the executive committee considered the whole question. The conditions have very largely changed since then, due to the introduction of motor traffic on the roads, but at that time the executive thought—knowing that a very large proportion of the tramway tracks of the country were owned or operated by tramway companies—that if we, the Municipal Tramways Association, took steps to get the revision of this section taken into consideration by Parliament, we should not make very much progress. We knew that in our own towns there would be a split in the camp, part of the Council would be in favour of keeping Section 28, and a part in favour of revising it. We thought the best thing was to do nothing, and we recommended the Council not to do anything just then.

Now there is a very much broader question of road maintenance to be considered as regards all the main roads of the country. I believe before very long the Government will be called upon to form a Royal Commission to consider this question on broad lines. The question of the maintenance of the paving in the tramway tracks is only part of a very much bigger question, and I think the proper course is to let the Executive Council carry out the resolution which was passed unanimously at the June meeting in London. I think that is the best way of dealing with the whole question.

The VICE-PRESIDENT: I think if I delete the words "Section 28," that would embrace the whole Tramways Act.

The PRESIDENT: The resolution passed in July does cover the whole point I think which is troubling us, and that is the question of road maintenance. It refers the matter to the Executive Committee to act with the other Associations as soon as possible. It is already under consideration by the Executive, and has been up on two occasions, and the best thing we can do is to leave it in that way.

The VICE-PRESIDENT: I withdraw my resolution.

The PRESIDENT: Is it agreed that we allow the matter to stand as it is? (Agreed.)

The President read the following telegram received from Vienna:

"Beg to acknowledge kind invitation; send best wishes and sincere greetings for successful Conference.

(Signed) Direktor SPÄNGLER, Vienna Tramways."

The Conference then adjourned until the next day.

## THURSDAY, SEPTEMBER 25.

The Conference resumed its deliberations on Thursday, September 25, at 10-30 a.m., when the President, Mr. A. R. Fearnley, called upon Mr. J. B. Hamilton, who read the following paper:

# URBAN PASSENGER TRANSPORT.

By J. B. HAMILTON

*(General Manager, Leeds Corporation Tramways).*

The question as to which is the best method of conveying passengers in urban districts, having regard to all aspects of the matter, needs no apology for its introduction at a gathering of the Municipal Tramways Association. The present time has been considered by your Executive Council as specially opportune for a discussion of the various methods of transport in populous centres, seeing that the "passing of the tramcar" has been loudly prophesied lately in certain sections of the London Press, and by several more or less irresponsible gentlemen who indulge in bombastic statements which they utterly fail to substantiate in any way.

In the early days of organised street traction, horse-drawn omnibuses were, following sedan chairs, the only possible means of public conveyance. The reduction of traction resistance and the smoother riding which resulted from the introduction of rails in the streets, caused steam and horse-drawn tramways to supersede the horse-drawn omnibus. These forms of traction have again, by the introduction of electricity as the tractive force, been superseded by the modern electric tramcar. The increased passenger capacity of each vehicle, coupled with a much higher effective speed, has enabled a great reduction in fares to be effected. These facts, in conjunction with greater comfort and economy of time, have created a revolution in the habits and possibilities of city life. The purchasing power of a penny has diminished in regard to many commodities, but in regard to tramway transport it will be seen that it has very much increased.

In many provincial cities, and very particularly so in Leeds, previous to the introduction of electric tramway traction, the central and older parts of the city were densely populated. It was necessary for tradesmen, shopkeepers, and others to live in close proximity to the scene of their daily labours, and similarly the working classes were unable to live at any great distance from the various workshops. The provision of a regular form of transit between the centre of the city and the various suburban districts at low fares, at frequent intervals and higher speeds, has completely metamorphosed the distribution of the residential parts of all towns.

It has been found by the writer impracticable to get figures illustrating the alteration in the distribution of the population from many of the towns in the country. It may, however, indicate the position sufficiently to state that in Leeds, in 1912 as compared with 1895, just shortly after the Corporation had taken over the working of the tramways undertaking, the population residing in the two central business wards of the city has decreased in one case by 25 per cent., and in the other by 35 per cent., whilst during the same period increases of from 40 per cent. to 60 per cent. have taken place in districts outside the central zone.

In 1893, by means of horse and steam cars and omnibuses, the number of times the population was carried was 30, whilst the average fare per mile was 1·124d. For the last completed year, 1912-13, the figures are as follow: Number of times population carried during the year, 179; average fare per mile, ·5d. This shows that the travelling habit has developed by nearly 500 per cent. That the services provided by the various tramway undertakers are much appreciated by the travelling public is further evidenced by the growing use of street transport, as each year sees an enormous total of passengers, with a substantial increase over that of the previous year.

All classes of citizens are free to make their homes in whatever district they may choose, knowing they can easily travel between them and the workshops, factories, and business centres; to shop and market at points where large stores and markets are situated, generally in the centres; to attend football matches, places of worship and amusement, and on occasions of holidays to utilise street transport to be conveyed to the outskirts of the city, where they may ramble about and enjoy the beauties of the country.

I think that tramway undertakers throughout the country, whether municipal or company, may claim that by the provision of suitable travelling facilities the great and pressing question of overcrowding and congested areas in unhealthy districts has been made capable of modification, if not of entire solution. This great work has been initiated through the agency of electric traction in the form of tramcars, and its further elucidation will rest with that form of traction or any improvement which science and skill in the future may realise.

Digitized by Google

The requirements of the form of traction necessary to meet the conditions which I have outlined must first provide for vehicles capable of dealing with large variations in the number of passengers. These occur on many routes at regular intervals, viz., before 6 a.m., between 8 and 9-30 a.m., between 12 and 2 p.m., and between 5 and 7-30 p.m. On Saturday afternoons the maximum demand practically continues for the remainder of the day from 2 o'clock onwards, rising to the highest peak between 10 and 11 p.m. But during the less busy periods of the day, whilst each car may average 10 to 12 passengers, there are inevitably very considerable irregularities. One car may have practically no passengers, whilst the following one may have from 40 to 50. The size of the vehicles should, therefore, be capable of meeting the public requirements by having a large carrying capacity.

Then there are, in addition to these, emergency requirements for special occasions, such as football matches, public gatherings, attendance at theatres, etc., etc., when a capacity of 60 per vehicle is very essential. Secondly, economy in operation, so as to enable the lowest possible fares to be granted.

The general Parliamentary maximum fare that may be charged is one penny per mile for ordinary passengers, and half that amount as "cheap fares for labouring classes."

Unquestionably a very large proportion of the success which has attended the introduction of electric traction is due to the fact that its economy of operation has enabled the undertakers to reduce fares from time to time, lower and lower, and it is marvellous to note the response in increased travel which each reduction of fare has produced.

In Glasgow, where the writer was a member of the staff at the period when the lines were taken over from the tramways company, the ordinary fare charged by the company was the Parliamentary 1d. per mile. There were practically no overlapping stages, so that for a very short distance in many cases a fare of twopence was charged, and yet the tramways as operated by the company were considered to be a commercial success.

Immediately upon the Corporation commencing operations, they gave halfpenny fares of approximately half a mile in length. From time to time, and within a very short period, the penny fare was increased from one mile up to two miles. The result of all this was that on every occasion when the fares were lowered the total receipts were increased. Under the last fare change which has taken place, viz., the granting of about a mile for a halfpenny instead of half a mile as formerly, the number of passengers within a year has increased nearly 20 per cent., whilst the gross revenue has increased by two per cent., or £20,373.

In Leeds, since 1902, the same phenomena have been noted. Every reduction of fare has produced an increased gross revenue as a result of travelling facilities being more frequently patronised on account of the more attractive fares. In 1902 the number of times the population was carried was 132, in 1912-13, as already stated, it amounted to 179 times.

Mr. J. B. Hamilton.

There must, of course, be an economic limit beyond which the reduction of fares cannot be carried. Whilst wages are increasing, and must continue to do so for some time, in other directions great economies are being carried out. The introduction of steam turbines in large units has lowered the cost of producing energy, as compared with 10 years ago, by practically half. Improvements in section and composition of rails and in the methods of track construction will undoubtedly lessen in the future the item of expense under this head, whilst the developments in other directions may still further increase the economies of operation. I look upon low fares as being essential in fully satisfying and developing the travelling requirements of our great cities and towns.

Thirdly, frequency of service, comfort, and speed of conveyance. The frequency of the service must be arranged according to what experience has shown are the requirements of each route. The best results, however, will be obtained by an over-provision rather than with a narrow margin of seating capacity over the actual number who travel. It is, of course, impossible to co-ordinate the service with the travelling requirements so that at every period of the day the same ratio of passengers and seating capacity should obtain. On every route there are variations from day to day of the period at which the maximum amount of travel occurs which would make that impossible. Again, conditions of weather and many other things vary the travelling requirements from day to day.

The point in the whole matter is that if a vehicle with a capacity of approximately 60 passengers can be provided at the same cost, or less, than a vehicle with a capacity of about 34 passengers, then even at the less busy periods of the day it is very likely to pick up more passengers, and at any rate will carry them, other things being equal, with greater comfort than a smaller vehicle possibly could. The higher the speed at which the conveyance can travel with safety in this hurrying age, the greater is the attraction to the public. Undoubtedly the saving in time—which also means money—on a two mile journey each way per day is of very considerable importance to the travelling public; the difference between six and eight miles per hour on this distance equals 10 minutes.

These are the general requirements which any form of locomotion proposing to serve the needs of the travelling public must, under present conditions, be able to supply. These necessities have undoubtedly been largely met by electric traction. It has created and fostered a demand for travel, which it has also supplied, and any form of traction which proposes to supersede electric tramways in the future must, in my view, meet these needs in a manner superior to tramways.

Several papers have been written during the last year or two, particularly on the subject of "Motor 'Buses *v.* Tramways for Street Transit." Principally, of course, these refer to the position of matters as they exist in the great metropolis of London at the present time. There is no doubt that considerable improvements in lightness and reliability have been embodied in the later forms of petrol omnibus traction as operated in London. In many quarters advocates of the motor 'bus have, without fully considering the matter, enthusiastically hailed this form of traction as the dawn of a new era in street transit, and asserted that tramways are henceforth to be considered as "back numbers."

Lord Montagu, in his evidence before the London Street Traffic Enquiry, was convinced that motor 'buses were so superior in many respects to tramways that he considered there would be no extensions of the latter, and even that their extinction would occur at no very distant date.

Mr. Worby Beaumont, M.I.C.E., who is technical adviser to the Associated London Omnibus Companies, has also recently read a paper entitled, "A Note on Road Passenger Transport in Cities," before the Imperial Motor Transport Conference on July 25, 1913. He considers that, due to the introduction of a "light high-speed internal-combustion motor, the advantage of rails in the streets has almost completely disappeared." "Tramways," he thinks, "continue to be of economic usefulness, more particularly in inter-urban connections, and in special cases where a transport service of some kind is required, but where it is not of sufficient importance to encourage the district authorities to construct well-made highroads." The point in his paper seems to be that a good surface for the roadway is the first and only requirement, and that upon that surface there should be run motor omnibuses. He makes no effort to give any figures to show the cost of making and maintaining the roadways, nor the cost at which the form of traction which he advocates, viz., motor omnibuses, can be run. It seems as if all his arguments were like his roads—to be merely composed of good surface. He is good enough to say that every city has to be individually considered with reference to its public passenger transport, and that circumstances may alter cases. He, however, thinks "that a system which may, if the commercial and general traffic be ignored, be quite suitable for, or even best for, public service passenger transport alone considered, might be so obstructive in its operation as to cause vast losses to the whole community. The system, therefore, which requires the heavy rails and the paraphernalia of a great railway installation in the streets and is of no other use except for the one particular kind of vehicle which is run upon it, has, at the present day, with the recognition of the value of good roads required for the greater part or the whole of the commercial and other vehicles, lost all the original reason for its adoption."

The writer begs the question both in these extracts and throughout the whole of the paper. There is generally no portion of a city's streets which is better paved and maintained than that section which comprises the permanent way of a tramway. Every vehicle using the

Digitized by Google

roadway can use that portion of it, and, as the figures in Mr Fenton's paper show, a very large proportion of the commercial and general traffic is carried upon the tramway lines.

To those of us who have had many years' experience of street conditions in various towns in the United Kingdom, it is obvious that relative to its carrying capacity the tramcar is less obstructive to other traffic than any other vehicle running on the streets. For one thing, its position in the street is defined by the rails. Any obstruction which is caused to traffic is caused to it by other vehicles remaining upon the rails, and not by it. It is more sinned against than sinning. Generally speaking, its control is much greater in braking effect than any other vehicle.

Mr. Worby Beaumont's alternative to the tramcar, viz., the motor 'bus, with its strong smells, its tendency to skid, and to the fact that at the rush periods of the day every tramcar as at present would be represented by two motor 'buses, will produce a mental picture to every delegate here of the condition of congestion and confusion which would occur every day in the central thoroughfares of the town they represent.

I have said that the carrying capacity of a motor 'bus is only half that of a tramcar, and that, therefore, for each tramcar there would require to be two motor 'buses; but this is only correct in fine weather. In inclement and rainy weather the effective carrying capacity of the motor 'bus is further reduced by fully one half. Motor 'bus traction, therefore, as compared with the general form of tramcars with covered tops, during stormy weather has only a carrying capacity of one quarter. Surely if there is any obstruction caused by tramcars, the cure proposed—that of substituting four 'buses for one car—is worse than the disease.

Mr. Beaumont rises above all sordid consideration of £ s d., and absolutely disregards the financial side of his recommendations. He does not even casually suggest the financial machinery which would be necessary to produce and maintain at great cost the magnificent roads he requires. He has no observations to make upon the cost of providing motor 'bus transit in substitution for tramway transport. He does suggest that "apart from the cost of its working, the tramcar in Greater London probably costs the community, by obstruction to the free passage of the general traffic and by losses and damage caused by the existence of the rails and the obstructions during repairs, far more than would a rate specially levied to cover interest and redemption of the whole of the capital that now stands as the tramway debt." Having made that statement, which he merely describes as probable, he very wisely does not attempt to proceed to support the bogus contention by a single fact or figure.

A paper entitled "The 'Bus *v.* Tram Controversy and Other Aspects of the London Traffic Problem," by Mr. William Yorath Lewis, A.M.I.M.E., etc., was read before the Society of Engineers on the 3rd February last. Mr. Lewis, whose paper is very cleverly written, makes a very fair comparison of the position of matters as between tramways and motor 'buses in London. He thinks "Londoners would do well to insist upon greater attention and less biassed consideration being given to the traffic problem, since it is unquestionably a matter of vital interest to both the classes and the masses. Cheap and effective rapid transit is the lifeblood of trade and the raw material of industry. It is the key of prosperity, the breath of modern life."

In these epigrammatic phrases the writer has crystallised the present day and future necessity for suitable urban transport. He further protests against the articles in the newspapers on motor 'buses *v.* tramcars, which he says have been "more in the nature of an attack upon the trams than a fair debate. In fact it has clearly been an organised attempt of motor enthusiasts and 'bus interests through various organisations, backed up by their friends in the trade Press and in political quarters, to protect the 'bus monopoly in the central area and to increase the robbery from the tramway undertaking of traffic which the latter has legitimately developed in the suburbs." To this end untrue and ridiculous statements have been made in many of the papers.

I had the pleasure of reading and hearing a paper given at the Congress of the Tramways and Light Railways Association by Mr. Pott, the chief engineer of the Metropolitan Electric Tramways, entitled, "The Respective Values of Tramways, Motor 'Buses, and Railless Traction as a Means of Transport."

A careful perusal of this paper in my view accords to the motor 'bus a position to which it is not justified on financial results. It is true that a comparison of working costs as between tramways and motor 'buses is shown. If Mr. Pott had the table for motor 'buses to prepare now, I am quite sure he would make one important alteration, viz., in the cost of petrol, which is given as ·7d. per 'bus-mile, with petrol tax at ·3d. The very great increase in the cost of petrol since the date of reading the paper would at least double these figures. The working costs also make no provision for depreciation in either of the forms of traction. Mr. Pott has also unfortunately ignored the lessened earning capacity on account of the size of the motor 'bus and the fact that it is not covered in on the top.

Full and reliable statistics are published annually by all the municipal tramways undertakings, and as a result of the standardisation of accounts, the inception of which was due to this Association, in most details the figures are directly comparable and provide data which is beyond question or cavil. To enable a comparison of the results of operation of their tramway undertakings by municipalities to be made upon a broad basis, I have taken every town—except London, where the form and cost of construction and other conditions are quite exceptional—which contains a population of over 150,000. These are scattered over all parts of the United Kingdom.

The object has been to ascertain:

First, the average annual earnings per car running daily in the towns quoted.

Secondly, the average cost, per mile and per car, of running those cars—this cost to include operating expenses, and interest and sinking fund required by Parliament. I have excluded all optional sums such as additional depreciation or renewals which may have been set aside according to the views of the various municipalities. In the case of motor 'buses the same procedure has been adopted.

Thirdly (*a*) I have estimated the annual value per car of the sums which the various tramway undertakings pay for maintenance of paving and sub-structure under Section 28 of the Tramways Act of 1870, and which, although unaffected by the operation of cars, goes to the relief of the department charged with the general maintenance of highways, and

(*b*) The amounts paid in rates upon lines only.

In the case of motor 'buses I have estimated the receipts (based on the earning capacity), the expenses of running, the cost of wear and tear of roads, in respect of which no contribution is made at the present time, and also the amount which would be paid to the Inland Revenue as a result of the use of petrol.

These various details are set out in Forms A, B, C, and D, and supplemented by explanatory notes on Schedules 1, 2, and 3.

Dealing with these points seriatim, I find there are 27 towns (Schedule No. 1) with a population of over 150,000, and that as a result of tramway operations in these towns there is an aggregate annual revenue of £6,769,705, that the average number of cars in daily use on the various undertakings on the basis of a 14 to 16 hour day is 3,996, whilst the total number of cars in stock is 5,687.

Dividing the total revenue by the number of running cars, I find that the average annual revenue per car is £1,694 (see Form A).

The total expenses, which include working expenses, interest, and sinking fund, income tax, rental of lines, less credits for bank interests, etc., amount to £5,607,732.

The total mileage run amounts to 146,810,902, which gives an average cost per mile for expenses of 9·167d.

Again, dividing the total mileage by the number of cars in daily use, an average annual mileage per car of 36,740 is obtained.

Multiplying this number of miles by the expenses per car-mile gives an average cost per car per annum of £1,403, which deducted from the earnings leaves a surplus of £291 (Form A).

The amounts shown in the published accounts for rates do not separate the amounts paid for buildings and for lines. It seems to the writer that the amount of rates for tramways should, for the purpose of comparison with motor 'buses, be confined to lines only. It is obvious that in the case of motor 'buses they will require to pay rates upon depots in the same way as tramways. They will not, of course, pay rates upon any power-station, but for the purposes of this paper this advantage to motor 'bus costs has not been taken into account.

As the basis of allocation of the rates to be made as between lines and buildings, I have taken the Leeds accounts as an illustration (Schedule 2). From these I find that about 75 per cent. of the total rates is for lines and 25 per cent. for buildings. In Leeds the tramways undertaking owns the power-station, which in this case, therefore, is a portion of the 25 per cent.

The total annual charge for rates on lines and buildings for the 27 tramway undertakings amounts to £315,239. Allocating this as between lines and buildings on the Leeds basis, viz., 75 per cent. of the amount for lines, gives £236,429 (Schedule 2). Dividing this again by the number of cars, the annual amount paid per vehicle is found to be £59 (Form A).

The excellent paper which was read before the Association yesterday by Mr. Fenton, will have proved to members conclusively that the conditions which guided Parliament in placing the maintenance of the surface of the highways between tracks, and for 18 in. beyond it, upon tramway undertakers, have entirely changed with the advent of mechanical traction. No wear can be caused to the paved surface of the streets by the passing of vehicles which are confined to rails, and the continuance of this obligation upon tramway undertakings has had a most repressive effect upon the development of rail transit.

As between different departments of a Corporation, it is relatively merely a matter of accountancy, because to the ordinary ratepayer it is immaterial whether the fare which is charged for a tramway journey provides, in addition to the direct costs of the construction and working of the tramways, an additional sum which pays for other public services, such as maintenance of portions of the highway entirely unaffected by tramways, and towards rates, the advantages of many of which can only affect tramways in a minor degree.

Digitized by Google

I believe, however, that indirect taxation of this kind is inequitable and unjust, and at the present time, when the character of street traffic, owing to the introduction of petrol and steam-propelled vehicles, is undergoing such a change which must force upon Parliament some altered conditions of taxation for the increased road maintenance, I would urge most strongly that the question of this most unfair charge upon tramways should come under revision.

It is impossible from the accounts of the various tramway undertakings to get an accurate statement of the amount which Clause 28 of the Tramways Act imposes upon tramway undertakers as apart from costs incidental to the construction, maintenance, and renewal of the rails. There is no doubt that the presence of the rails does cause a certain amount of extra wear upon the setts which are placed alongside of it, whilst rail movement, which from time to time must occur on all routes, also increases the cost of maintenance of the paved surface.

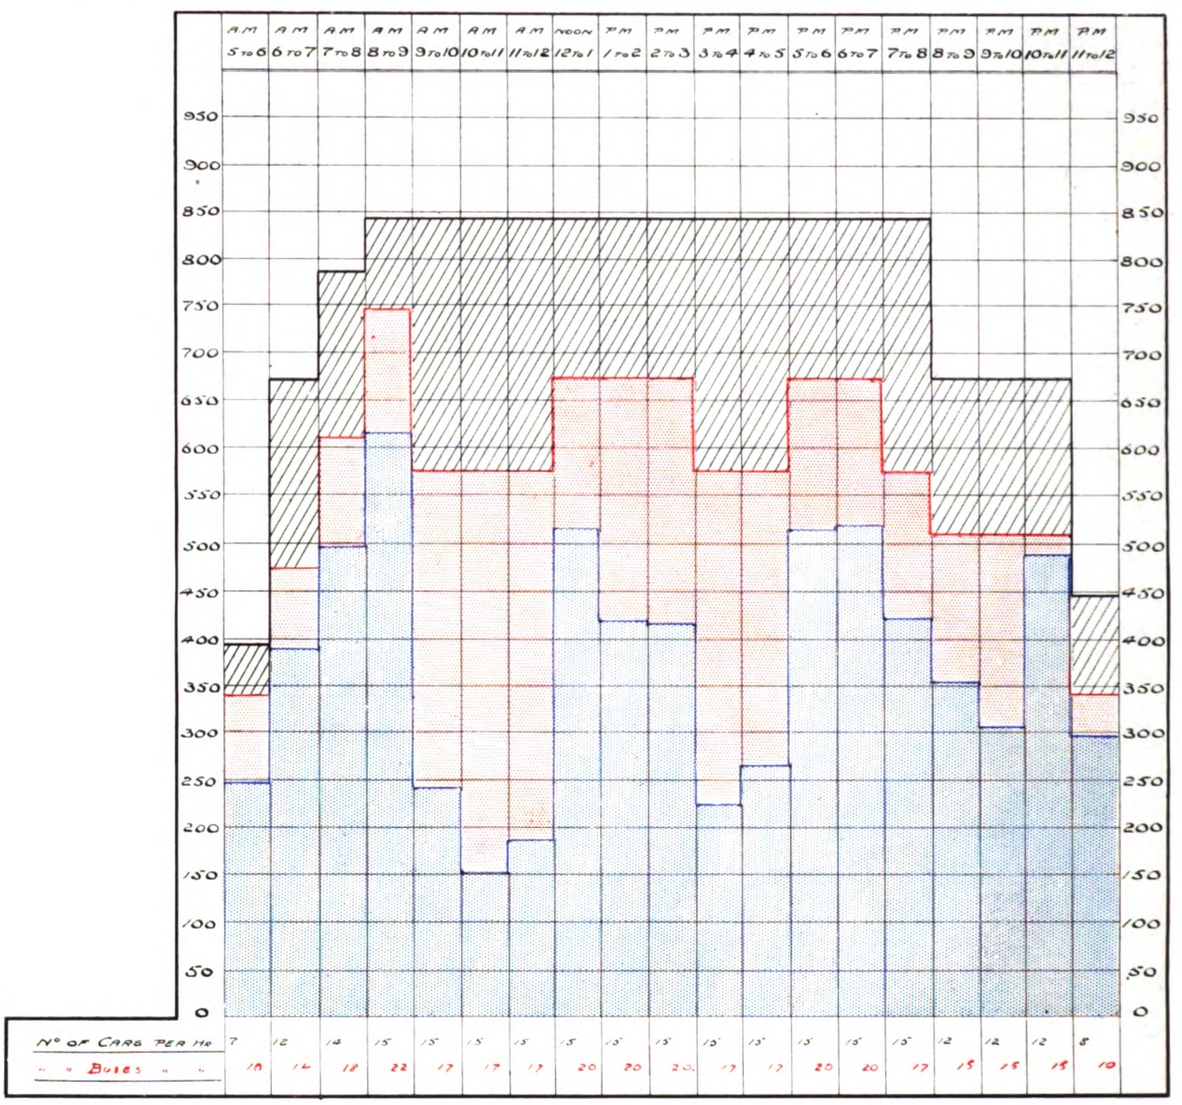
£3,040 would be required. This figure represents the replacement cost of the concrete bed and paving setts, etc., less the residual values.

These figures applied to the number of cars give an average charge per vehicle per annum of £61. (Form A.)

In considering the costs of energy it may be a matter of opinion, but in my view the extraordinary development in turbines has cheapened the cost of current to such an extent that it is easily possible to estimate that in the prices paid by the various undertakings which purchase current, there is a considerable profit per unit to the producing department.

I have not, however, added any figures as being a portion of the other general advantages in lowered costs, etc., which the supply of electricity to a tramways undertaking gives to the city user generally, or as a profit in relief of rates.

By adding together the items dealt with, a total is arrived at of £411



Blue.—Total Number of Passengers each hour. | Black.—Seating Capacity of Cars (56) each hour.
Red.—Seating Capacity of 'Buses (34) ,, ,, | Margin of Vacant Seats for Intermittent Loading—'Buses 54%, Tramcars 103%.

**Leeds City Tramways.—Diagrammatic Chart showing actual operating conditions of Tramway Service and estimate of Motor Omnibus Service on supposition that the latter has an earning capacity of 80% of a Tramcar.**

To form a reasonable estimate, I have assumed that the cost of the maintenance of the concrete, the paving bed and setts at the periods when the rail requires to be taken up should be taken to be work performed not for the tramways undertaking, but for the advantage of the highways rate.

For that assumption I have estimated the average life of the rail at 15 years. The whole of the maintenance of the setts during the 15 years of the life of the rail—and this is a considerable item—I have charged as being directly caused by the presence of the rails. On this basis I find that at the end of 15 years a sum of £1,331 per mile of single track would be the cost of taking up, re-dressing, and re-laying the setts, repair of any concrete required, and provision of floating, paving bed, etc. (Schedule 3.)

At the end of 30 years from the laying of the track a cost per mile of

per tramway vehicle per annum. (Form A.) In other words, an average surplus of £291 (Form A) per car accrues from the operation of tramways in the towns referred to, and owing to the presence and operation of the tramways an addition to that amount of £120 (Form A) in rates paid, and in maintenance of roads, goes to the general benefit of the town, and in none of these respects would the operation of petrol omnibuses furnish any return to the city.

Turning to the financial consideration of motor omnibuses (Form B), it must be obvious to everyone who considers it that the carrying capacity of a passenger vehicle is an important factor in determining its earning power. In all the cities and towns referred to, the provision of travelling facilities is varied at different hours of the day on the different routes according as experience has shown the travelling requirements ebb and flow.

Digitized by Google

To provide sufficient accommodation for the busy periods, and whilst considering full employment for the crews to be able to withdraw sufficient vehicles so as to be running as little as possible unnecessary mileage at slack times, is the continuously strenuous effort of the traffic staff.

The size of the modern tramcar, which may be taken as having a seating capacity of say 56 passengers, with in many cases the addition of eight standing, is the outcome of applied experience under varying conditions of traffic and graded fares as being the size of vehicle upon which, when fully loaded with passengers, the collector can be expected to deal satisfactorily with the fares, etc. If some simpler form of fare collection or incidence of fare charges, such as 1d. any distance, and so on, is operated, then there is no reason why all cars, as they already are in some instances, should not have a carrying capacity of 70 to 80 passengers. In that case the cost per seat supplied would be proportionately lowered.

In carrying capacity it is clear that the motor 'bus, even of the most up-to-date type, cannot hope to compete. On paved streets and on gradients such as exist in nearly every provincial town, a vehicle for passenger traffic which has a capacity of over 34 passengers is not a practicable proposition. It is, of course, quite easy to increase the engine and size of the vehicle, and relatively of its load, but it is not possible to do so and maintain the effective rate of speed at which tramcars are operated. The question of brake control, skidding, and road wear, becomes a most serious consideration, and indeed a prohibitory condition, if the size and consequently the weight of the motor 'bus is increased much beyond the London type, which seats 34.

If the seating capacity of a tramcar at 56 is compared with a motor 'bus of 34, then the latter has only 60 per cent. of the capacity of a tramcar.

It may be urged that at the periods of the day when the minimum amount of travel occurs, a vehicle with a capacity of 34 can earn as much per mile run as a vehicle with a capacity of 56. To provide a comparison, I have caused very careful examination to be made into the actual results obtained from tramway operation on a representative route. I append to this paper (p. 332) a diagrammatic chart showing the actual number of passengers carried hourly at the various hours of the day, and also the actual number of seats provided on the tramcars.

Notwithstanding that the capacity of a motor 'bus is only about 60 per cent. of that of a tramcar, I have estimated that the earning capacity of a motor 'bus may be taken over the whole day as being equal to 80 per cent. of that of a tramcar.

On the diagram referred to, I have shown the actual carrying capacity which motor 'buses would provide if the number of motor 'buses were increased on the assumption that the capacity of a 'bus equals 80 per cent. of that of a tramcar. In this connection it will be noted that the view that a motor 'bus can earn 80 per cent. of a tramcar's receipts in actual practice is a liberal one, and whilst it makes provision for the average hours, there is a much smaller margin of surplus seats to provide for intermittent loading than in the case of tramways.

On the assumption, therefore, for the purposes of this paper that each 'bus will earn 80 per cent. of each tramcar's receipts, then, as the latter as shown earns £1,694, each motor 'bus would earn £1,355 (Form B), running the same number of miles per annum, viz., 36,740.

With regard to the cost of running motor 'buses per mile, it must be agreed that considerable improvements, which reflect themselves in lessened costs of repairs and maintenance, have been applied to motor 'buses during recent years.

The principal users of motor 'buses have, of course, been the large London companies.

The whole of the conditions there are unique; the growth of the business portion of the metropolis preceded the development of almost any form of street transit. The density of the traffic even in the days of the horse drawn 'bus and cab, was without parallel in any city in the world.

Electric-conduit traction which followed horse-drawn tramways, with its increased speeds and greater attractions for the travelling public, could only be applied in wider or less densely thronged streets than those in the centre of the city through which all the traffic passes. It has, therefore, been impossible, owing to the width of the highways and the amount of traffic, to apply rail transit in the main highways of the City, and it has had to be confined to the approaches to the City.

In this respect it is entirely different from practically every other great city or town in the country where the ramifications of the tramways are carried right through the busiest central parts, from east to west, and from north to south.

The physical barrier to the extension of the tramways through the centre of London gave for many years a protective area to the horse-drawn omnibus which, due to the limitations of this form of traction, was only able to extend its services beyond the centre for a very short distance to the areas outside.

The advent of the motor 'bus which has superseded horse traction, coupled with the improvements in weight and reliability of the last few years, has enabled the motor 'bus, subsidised by its protected area and freed from the onerous charges imposed upon tramways in the form of rates, road maintenance, etc., to adopt an aggressive competition with the electric lines operated by the London County Council and the various municipalities and private companies surrounding the central area.

This enormous volume of street traffic has imposed upon the road authorities in the centre of London and the borough councils around it, the necessity of maintaining a very high standard of road surface. The expression "as smooth as a billiard table" has frequently been truthfully applied to the main thoroughfares of Greater London. The absence of gradients has also been a very great factor in producing the financial success which the motor 'buses have achieved.

Looking to all these conditions which only exist in London and in no other part of the country, it is obvious that an impartial consideration of urban passenger transport to be operated in all the great centres of population in Britain cannot accept the revenues or operating costs of motor 'buses in London as providing a fair estimate of what might occur from installing the same form of transport in the provinces.

Consideration of the comparative merits of the two forms of traction must presume that it is possible to have either in operation. In London, for the present time at least, it would be impossible to institute rail transit along the main highways of the City.

Any figures, therefore, which it would be possible to obtain as to the cost of operating motor 'buses or the receipts obtained by the London companies, must be considered as quite exceptional. No authoritative figures, however, have been issued. In the accounts of the London General for 1912, a figure of 9·76d per mile has been given. It is probable, however, that as the company very naturally do not desire to inform the public of the exact costs of their operation, this figure cannot be taken as being a correct one. It has been impossible to get reliable figures of the cost of operation from companies operating motor 'buses in other parts of the country. There are, of course, very few companies on any large scale which do so.

Mr. Pott, who carefully prepared a paper last year, gave some figures for the cost per 'bus-mile of omnibuses. These figures, he stated, were averages of the actual working costs of several large undertakings. As Mr. Pott's figures were evidently prepared before the very large increase in the cost of petrol during the early part of the present year, I estimate an increase of one penny per mile for petrol.

Further, the figures do not include any sum for depreciation. On the basis of the time allowed by Parliament for sinking fund, viz., five years, this amounts on a mileage of about 25,000 to 1·54d. per mile, making the total cost 10d. per mile.

In the case of municipalities whose figures are usually available, the Corporations of Keighley and Eastbourne have been working fleets of motor 'buses for a number of years.

The costs of operation are as follow:

Keighley, 16d.; Halifax, 12·7d.; Eastbourne, 14·30d. per mile.

Any conclusions, however, drawn from the figures appertaining to Keighley or Eastbourne would be unfair to the motor 'bus, inasmuch as these are mainly vehicles which are not of the most modern type.

Again, the most modern type having been in operation for so short a time, results of a nature which would average over the whole life of a 'bus have not yet been obtained.

I may, however, refer to the case of Halifax, who have quite fairly given their figures in their annual accounts lately issued. These, of course, only apply to comparatively few months of a period of the life of a 'bus when the costs of maintenance and repairs should be at the minimum. On the other hand, the routes upon which the vehicles are operated have at some points a very rough surface, and no doubt this to some extent has adversely affected the costs.

After a very great deal of consideration and examination of private figures, I have come to the conclusion that 10d. per mile, to include all costs of operation, interest upon the outlay, and sinking fund as applied by Parliament in a like manner as with tramways, is a fair and

Digitized by Google

reasonable figure. In this respect I understand from a communication that I am in agreement with our esteemed President, who has during the last few months been operating some modern motor 'buses.

In applying the figure of 10d., I should like it to be clearly understood that I think this a very reasonable figure, looking to the cost of petrol at the present time, and that in the capital account no notice has been taken of the fact that for the purpose of working city services of the magnitude under review in this paper, a large margin of spare 'buses would be required as against tramcars. This would undoubtedly considerably increase the cost per mile for interest and sinking fund. On the basis of 10d. per mile, I find that the total expenses per vehicle would be £1,531 (Form B). This amount is greater than the earnings, and therefore leaves a deficit of £176 per vehicle per annum.

I presume it will be at once said: "There is no person who will run motor 'buses in the 27 towns referred to at a loss." My answer is to ask how that profit would be made unless the fares were increased or the frequency of service reduced. If the present low fares, which in most cases approximate to two miles for 1d., were continued together with the present services, which are such an important factor in saving time and increasing the convenience of the travelling public, then the results must inevitably be as I have put them.

As I have already pointed out, tramways, in addition to providing a profit per vehicle per annum, also contribute to the rates on lines and in general road maintenance. To none of these, under the present condition of the law, would motor 'buses contribute, but on the contrary would cause wear and tear upon the streets.

Much discussion has taken place during the last year or two on the question of road maintenance by vehicles, and in a previous part of the paper the writer has stated that in his view the time is now urgent when amendments to the existing law as to the method of taxation for road purposes should be carried out. In practically every case during the last session of Parliament in which powers have been sought for railless cars and motor 'buses, the decisions were that they shall directly contribute to the repair of the wear and tear and what was termed damage to the highways in varying degrees. The amount generally imposed has been ⅜d. per mile. I express no opinion here as to whether this is or is not a sufficient sum, or as to whether or not in the absence of charges being made general upon all road users, this obligation should be placed upon promoters of motor 'bus traction. I compare the ⅜d. per car-mile which has been imposed for running usually on macadamised roads, with the amount of wear which might occur upon streets which are paved and partly macadamised, and as a result I debit the operation of motor 'buses in urban districts with ¼d. per mile as an estimate of the cost of repairing in consequence of their running. This amounts on the mileage to £38 per vehicle per annum, and increases the deficit from £176 to £214 (Form B). As a deduction, however, from this, credit must be given to motor 'bus operation for the amount at which the petrol they use is taxed by the Government and earmarked for road purposes. This equals 1½d. per gallon, and I estimate that on the basis of 7½ miles per gallon this amounts to a total of approximately £31 per annum. This amount deducted leaves a net deficit per motor 'bus of £183 (Form B).

This for the whole of the 27 undertakings is an annual loss of £914,085 (Form C).

Summarising the position, it means that instead of the various towns getting, as at present, a profit in receipts and other services to the towns of £1,642,356, there would be a loss of £2,556,441, due to the assumed substitution of motor 'buses for the existing tramways (Form C).

Applying these figures to Leeds, it would make an adverse difference to the city of £137,600 per annum. Instead of an annual benefit to the rates—including net surplus to relief of rates, renewals of paving, and local rates payable—of £88,371, there would be a loss on motor 'bus operation of £49,229, or a total loss of £137,600 as before mentioned.

On Form D the whole financial consideration as between the two forms of passenger transport is focussed to a point. The annual cost per seat provided in the case of tramways is under £23, whilst for motor 'buses it is over £45, or practically double that of tramways.

Summarising the position as between tramways and 'buses, it does not seem to the writer that even if tramways were not already installed and the expenditure made, there could be the slightest hesitation from any point of view in the selection of tramways for urban passenger transport as against motor 'buses. The fact of its larger carrying capacity, the economy, safety, and speed of its operation are overwhelmingly in favour of the tramcar as against the inevitably smaller motor 'bus with its greater unreliability in operation, its higher cost of working, and tremendously increased danger of operation to pedestrians and other road users.

In the latter respect the facts given in the report of the Select Committee on Motor Traffic show that motor 'buses have seven times the number of fatal accidents, and twice as many injuries per million passengers, as compared with tramways. "This lessening of the margin of safety applies not only to the motor 'bus, but also to other mechanically-driven vehicles." The observations of the Committee in this respect are "that accidents and fatalities with tramcars which are more in number have not increased, but there is still room for improvement, whilst petrol-driven vehicles have increased greatly in number and the total number of accidents and fatalities having increased in greater proportion than the total number of vehicles, it is to this class of traffic that the growing danger is due."

On the question of safety, it is stated in the report of the Advisory Engineers of the Royal Commission with regard to motor 'buses that "their very elasticity which permits them to turn out from their stopping- places out of their proper order and to meander and move sideways on the road and to be driven two and more abreast is in many cases a material element to road congestion. Flexibility implies taking advantage of chances of passing other vehicles, and although it may be an advantage in speed as against other *competitors*, it is not without its special element of danger."

### RAILLESS TRACTION.

At such length has the main question of Tramways *v.* Motor 'Buses been discussed, that but little space can be devoted to this or other forms of traction. As a means of transport for urban traffic, it suffers from the same limitation in size which applies to the motor 'bus and all other vehicles which run upon the road surface at a sufficiently high speed to meet the customary requirements of passengers. Unlike the motor 'bus, however, it is entirely free from smell, and it may also be claimed for it that it is almost entirely free from the tendency to skid. The latter is due no doubt in a large degree to the fact that the motors and weight are not placed upon one end of the chassis, but are slung below the level of the chassis and near its centre.

In total costs of operation under ordinary conditions, it is at least from 20 per cent. to 25 per cent. less per car-mile than motor 'buses. It is equal in flexibility, in an ordinary width of roadway, viz., 30 ft. to 35 ft., to a motor 'bus.

After being in use for a good number of years on the Continent, it has now been brought into operation in eight different districts in England, and several undertakings are now in course of construction.

It has never been claimed for it that, except under special conditions, it should be substituted for tramways in cases where very large volumes of traffic are required to be dealt with, nor where a very close and frequent service is necessary. In streets or highways which are too narrow to permit of the passing of vehicles confined to rail traction in conjunction with other vehicular traffic, for districts where the traffic is too infrequent to justify the higher capital outlay necessitated by tramway construction, and generally as an auxiliary to and as feeder for tramways, this form of traction has a very great future.

Its lessened costs as compared with that of motor 'buses, and its greater reliability in operation, make it preferable, as a feeder to an electrically-operated undertaking, to that form of traction. Each case must be judged on the local conditions, and in relation to the cost of installation and operation. Routes can certainly be more readily dropped and new ones opened with the migratory motor 'bus.

Other forms of supplying urban transport, such as petrol-electric motor 'buses, storage battery, steam, etc., vehicles, I do not think it necessary to enlarge upon. In every case the remarks as to higher costs of operation and general disadvantages, as referred to in connection with petrol motor 'buses, apply equally to them.

In London the example of conduit tramways is in full operation. Whilst this avoids the erection of poles and trolley wires, it has the very serious and in most cases insuperable objection of the cost of construction. It is only a city such as London that would be justified in facing this greatly increased cost. Apart from its higher cost of construction and operation, it claims the same advantages over motor, etc., 'buses, as overhead electric tramways.

Other forms of rail traction, such as surface-contact, have been in in operation in different parts of the country, with more or less satisfaction, for a number of years, and some self-contained forms of traction are being tested at the present time by means of petrol-driven tramcars. The latter, though still immature, may be found most useful where it is undesirable to erect overhead wires, but the costs of operation, which must be higher than where electricity is the tractive force, are not yet established.

There are, no doubt, many aspects of the great question of passenger transport upon our city streets which within the limits of a paper of this kind I have not touched upon, or done so in a very brief way. In the discussion which I trust will follow, other phases of the matter will, I hope, be fully dealt with.

One conviction stands out clear and distinct in my mind, and that is that the era of rail transit for the above purposes shows not the slightest sign of being superseded by any other form. The petrol combustion engine has done many wonderful things in increasing the possibilities of speed of motor cars and boats, and in assisting in the conquest of the air, and naturally those who are identified with it consider there are no bounds to its possibilities in any direction.

The report of the Select Committee on Motor Traffic makes it abundantly evident that motor 'buses are infinitely more dangerous from their very mobility than the rail-confined tramcar with its defined position in the street. As *Punch* has illustrated it, the tramcar can only go where the rails permit, whilst the motor 'bus can go where it

Digitized by Google

likes, and very frequently it unfortunately seems to go where it causes injury and damage.

To epitomise briefly the position, the motor 'bus has seven times the number of fatal accidents per vehicle per annum and twice as many injuries per million passengers as compared with tramways. Its obstructive street condition in fine weather is as two 'buses are to one tramcar, and in inclement weather as four 'buses to one tramcar, whilst the cost to a municipality of providing transit by motor 'buses is double the amount per seat provided by electric tramways.

PAVING OF TRAMWAY TRACKS.

Expenditure devolving upon tramway undertakings in respect of partial renewals and complete renewals of paving of tram tracks and margins. (Referred to in Form A.)

RECONSTRUCTION AND PARTIAL RENEWAL OF PAVING, ETC., OCCURRING AT END OF 15 YEARS DATING FROM CONSTRUCTION OF TRAMWAY.

Estimated cost per mile of single track .. .. .. £1,331

Aggregate length of tramway tracks operated by 27 authorities each serving populations of over 150,000. Miles of single track 1,671.

Cost per mile £1,331 × 1,671 miles total cost of partial renewals .. .. .. .. .. .. £2,224,101

COMPLETE RENEWAL OF PAVING AND FOUNDATIONS OCCURRING AT END OF 30 YEARS DATING FROM CONSTRUCTION OF TRAMWAY.

Estimated cost per mile of single track .. .. .. £3,040

Aggregate length of tramway tracks operated by 27 authorities. Miles of single track = 1,671.

Cost per mile £3,040 × 1,671 = total cost of complete renewals £5,079,840

Total cost of partial and complete renewals of paving and foundations to be spread over a period of 30 years (£2,224,101 + £5,079,840 =) .. .. .. .. £7,303,941

Average charge per annum upon 27 tramway undertakings (including interest on annual instalments) £7,303,941 ÷ 30 = .. .. .. .. .. £243,465

Average number of cars in use daily .. .. 3,996

Average charge per annum per car = .. .. .. £61
(£243,465 ÷ 3,996 = £61.)

## DISCUSSION ON MR. HAMILTON'S PAPER.

The PRESIDENT: I think you will agree it is quite appropriate that we should ask a gentleman who is intimately acquainted with the motor 'bus question to open the discussion. The Council have asked Alderman Littler, of West Ham, to be good enough to do so, and he has kindly agreed.

Alderman H. W. LITTLER (chairman, West Ham Tramways Committee): I think we ought very heartily to thank Mr Hamilton for placing before us a paper of such great importance. (Hear, hear.) We as representing the municipalities of the country ought to congratulate ourselves on the large amount of information and useful knowledge he has placed before us. In dealing with the question from our point of view as municipal representatives, there is one aspect which does need emphasising, at any rate so far as the London area is concerned. Mr. Hamilton referred to it two or three times, but I am justified in trying to emphasise it further; that is the great difference there is in the safety of the users of the streets when you use tramways as compared with motor 'buses. (Hear, hear.) This Association must approach the subject from the point of view very largely of the safety of the public, and if I may repeat my own words, which I used in a letter I wrote to the *Municipal Journal* some time back, in speaking of motor 'bus traffic: "The vital issue is whether London traffic is to imply unnecessary sacrifice of life and the complete surrender of the right of the private individual on the highway to the usurpation of the bully of the road—the motor bus," which was once very appropriately described by an ex-president of this Association as a "liver-jerking oil can on wheels." I do not know whether, since he has accepted salvation in a petrol tank, he would speak quite so disrespectfully. (Laughter.) In 1868 the first private tramway Bill was brought before Parliament, and was referred to in Mr. Fenton's paper yesterday. In 1870 the charter of the tramways passed through the House, and it is owing to that Act that we have received all our blessings, but also owing to the defects in that Act, or rather its being so much out of date, that a large number of our curses rest on our shoulders to-day. (Hear, hear.) The principal of these are road maintenance, rating, the unfair burden of street widenings, and, generally, the unfair conditions which have been emphasised in the paper. In 1876 in London we had 61 route miles of tramways, out of a total in the country of 196 miles, and I would like briefly to run over the three periods of tramways to point out what tramways have done in the country as a whole, and what they are doing to-day, and then to wonder why it is that the unthinking public are trying to make it appear, that it is time tramways were scrapped, and something newer put upon the roads. Taking the Board of Trade returns for 1879, we get these particulars: route miles open, 321; total number of passengers carried 151 millions; miles run by cars, nearly 20 millions; percentage of working expenses to gross receipts at that time, 83 per cent; passengers carried per mile of route open, roughly 500,000; passengers carried per car-mile, 7·77; average receipts per passenger, 1·84d. From that date forward various methods of traction were tried, but if we take the returns for 1898—which the Board of Trade described as the "steam period"—we find there is a wonderful development in the tramways. The miles of route open were 1,064; total number of passengers carried, nearly 900 millions; miles run by cars, over 90 millions; percentage of working expenses to gross receipts, 70 per cent; which is a very considerable drop from the previous period; passengers carried per mile of route open, 800,000; passengers carried per car-mile, 9·84; average receipts per passenger, 1·23d. Thus in that period you will see that the public received a very material benefit in the large reduction in the average charge per passenger. The increases which occurred in that period are, in mileage 231 per cent passengers carried 468 per cent, and passengers carried per mile of route open 72 per cent.

Taking the electric period of the past year, we find that the tramway track open was 2,637 miles, carrying passengers to the number of 3,127 millions odd. The miles run by the cars were 323 millions odd, and the percentage of working expenses to gross receipts was down to 60·6 per cent. The passengers carried per mile of route open were 1,183,000; the passsengers carried per car-mile, 9·67, and the average receipts per passenger 1·079d., with this added factor, that the relief of rates amounted to £488,000. I will not go over the increases, but my reason for giving these figures is this. Can anyone suggest seriously, with a huge organisation spread over the country, and providing such an enormous amount of convenience as these figures show, that the time for scrapping them—which seems to be the dream of one section of the Press—is anything like approaching? The amount of capital sunk in the tramways is somewhere about £77,000,000. One feature of tramways which I think has helped to develop them has been the facilities for inter-running, which commenced in 1904. Unfortunately, in London there was a mistaken policy on the part of the London County Council and one or two of the surrounding areas in opposing inter-running. Fortunately the position is entirely altered to-day, and with one exception the whole of the group of tramways on the eastward side of London have the fullest inter-running facilities; and I think I am justified in saying that, wherever inter-running has taken place, the results have proved satisfactory to the operators, and improved the earning value of the cars on every road where it has been done. There is no doubt that, had inter-running in London been introduced at an earlier date, a very large percentage of the passengers at present carried by the 'bus company which runs through our area would never have been in their hands. That that traffic has been appropriated by the 'buses is due, in my opinion, largely to the fact that we did not make provision to deal with it ourselves. I have a few figures with regard to the present tramways operating in the metropolitan area. I find that the municipal tramways operating around London have 200 miles of route open. The total number of passengers carried is 640,000,000; miles run by the cars, nearly 60,000,000; percentage of working expenses to gross receipts, 72 per cent.; passengers carried per mile of route open, 3,107,000; passengers carried per car-mile, 10·67; and the average receipts per passenger are down to one penny. Taking the undertakings of the companies operating around London, we find that they have 123 miles of route open, carrying 100,000,000 passengers. The miles run are 22,000,000, and the percentage of working expenses is 63. The passengers carried per mile of route open are 1,302,000, and the passengers carried per car-mile 7·29. Their average earnings per passenger are 1·25d. There you will notice that of the work done and the routes open, the municipalities are providing far more accommodation, and carrying far more passengers, but they have to do it at a farthing per passenger less. If we could get that extra farthing and give the same satisfaction to the public, I am sure the whole of the metropolitan tramways at the present time would be very grateful.

I should like to put before you one other thing, as far as we can get it—what is being done by the 'bus companies? I believe they are working about 300 miles of route. The estimated total number of passengers carried is 640 millions, and the miles run by the 'buses 65 millions.

Digitized by Google

We cannot get any figures, though we made strenuous efforts to do so, as to what their expenses are compared with their gross receipts. The passengers carried per mile of route—and, of course, these are all estimated figures—are 2,130,000, and the passengers per 'bus mile 9 8. Apparently the average return per passenger is 1·32d. It has been suggested by Mr. Beaumont—and Mr. Hamilton brings it out in his paper—that the tramways should now make place for something newer, apparently motor 'buses. But I will take one typical day in December last, and give a comparison of the number of tramcars and 'buses which crossed over Bow Bridge, which is just on the dividing point between our area and the London County Council area. There were no less than 89 cars per hour, carrying an average of 20½ passengers per car. There were 87 'buses per hour, carrying an average number of passengers of 14½ per 'bus. During that particular day the average highest number of passengers per car for any given hour was 49, and on the 'buses 31. I want to express that in a somewhat different method. 20½ passengers were carried by the tramcars for every single unit of danger in the streets (and I am treating both the tramcar and the 'bus as a unit of danger, as against the ordinary user of the highway); the 'buses carried 14½ passengers per unit of danger, but it must be remembered that the 'bus—as has been brought out by the Select Committee on Motor Traffic—is seven times more dangerous than a tramcar. Therefore, the proportion you get is 20½ passengers carried by a tramcar, as against 14½ by a 'bus with seven times the risk to human life, and we, as representing the public, have to take this point into consideration perhaps more closely than is necessary by the commercial fare hunter. Following up that point, I do not think I can do better than read a report which is in a report to the London County Council of May 14, 1912. I find, taking it roughly, that although the figures taken by the London County Council are over districts quite different from Bow Bridge which I have been dealing with, that the proportion of 'buses and tramcars works out much the same. There is one other point I may refer to before I read the London County Council report, that is, that if the tramways are to be removed from that road, and to be replaced by 'buses, you would have the original 87 'buses at that point, plus 178 'buses to replace the tramcars, which would mean 265 'buses per hour passing over that one particular point. So that I shall not be accused of making out the case unfairly against the 'buses. I have allowed that all the 'buses would run practically full; that gives you the figure of 228 'buses per hour at this one point. That road carries some of the heaviest traffic outward from London. Can anybody reasonably propose that the tramcars should, for any reason whatever, be taken off the streets, if you are to maintain the transit facilities for the people of the area, and replaced by 'buses? It simply means that the congestion would be so terrific as to be outside all reasonable consideration. Mr. Hamilton asks whether the figure is taken both ways. Yes. It is five a minute, and the service of 'buses and tramcars has been largely augmented. The report of the London County Council I was going to refer to runs in this way:

"If electric cars were entirely withdrawn and the same seating accommodation had to be provided by motor omnibuses as is now provided by tramcars, 2,688 omnibuses, or an increase of 114 per cent. of vehicles over the number of tramcars would be required during fine weather, while during inclement weather, when only the inside seats of omnibuses are fit to be used, 5,712 omnibuses, or an increase of 354 per cent. would be required. The Walworth Road route may be taken as an instance of the addition which would be made to the congestion of the streets if omnibuses were entirely to take the place of tramcars. During the busy period of each weekday morning 70 omnibuses and 100 tramcars pass any given point in Walworth Road in one hour. If the electric cars were withdrawn and the same accommodation were given by omnibuses, the result would be, on a dry morning, 284 omnibuses an hour and on a wet morning 603 omnibuses an hour. At the present there is a tramcar every 141 yards; with 284 omnibuses there would be one of these vehicles every 50 yards; with 603 there would be an omnibus every 23 yards in each direction. This calculation is based on a speed of eight miles an hour, a speed which could hardly be exceeded even if it were practically possible to run such a service of omnibuses."

My reason for emphasising this point is this, that there has been for a considerable time a definite campaign in favour of what may be bluntly described as the scrapping of the tramways of London. I think the figures with regard to Bow Bridge and the report of the London County Council show the absolute impossibility of such a position ever coming about with regard to London. (Hear, hear.) The trackless trolley system I do not propose to deal with at all. You have several examples of it round here, but from London's point of view I think it may be practically considered as unsuitable. We could not run them in our heavy congested areas.

There is one thing which may be of interest to you, although I do not personally know anything of it. I had information supplied me the morning I came away with regard to a proposal for a storage battery tramcar. Mr. Hamilton suggested that such a thing is impracticable, but as it may be of interest to you I can give you the figures of the estimate put forward by the storage battery firm in their proposals to the town of Morecambe. The seating capacity of the car is 34 outside and 22 inside. The total weight of the car is ten tons, and the extra allowance for passengers is four tons. The speed is ten miles per hour, the battery is estimated to cost £650, and the weight of the battery is 1·2 tons. The battery consists of 120 Type A.C. Edison cells, and the car batteries it is suggested should be charged at night time, with an extra boosting pressure towards the end of the loading up. The two motors are of 15 H.P. each, with seven-speed control, brakes, and other details. The cost per car is £1,350. Those are suggestions which have been recently made. If any of you are looking for anything in that direction you may find those figures informative. (Laughter.) There is one other point which does need emphasising, and that is that the maintenance of the roadways at the present time is one of the heavy burdens on tramways in the London area. There seems to be some objection to the idea of putting a tax on other users of the road, or re-establishing the old wheel tax, but I think during the last session the Government have given the principle completely away, because with regard to trolley 'buses, and in some cases motor 'buses, they have established the principle that where those are run by one authority outside their own area they shall contribute something towards the maintenance of the streets for damage done: ⅜d. is the figure which is being put into some of the bills, and there is one important point in addition to that. It is that the road authority at the end of three years shall have the right of review for the purpose of amending the contribution if it is not found to be sufficient. That, I believe, does not apply in every case, but it does in re-rating. I am representing London areas, and another point is this: Give us the position as it was a few months back, when we were being rated as light railways only to the extent of one-fourth—and I believe the tramcars in and around London, though they are showing a deficit at the present time, could satisfactorily compete with the whole of the 'bus traffic, and infinitely better meet the demands of the public than the 'buses can possibly do. We are more capable of bearing overload at times of pressure, and on the question of safety there is no need to compare the two things at all. There are in Mr. Hamilton's paper many more points which I should like to have dealt with, but I feel I have taken up more time than is justified, and I will close by thanking Mr. Hamilton very sincerely personally—and I am sure you will endorse it—for his able paper. The information there contained will be of material service to us, both in London and throughout the country. (Applause.)

The PRESIDENT: I think you will agree that in Mr. Hamilton's paper there is some very straight talk on the practical question of motor omnibuses. We have with us to-day, in addition to the visitors, Mr. Worby Beaumont, the technical adviser to the Commissioner of Metropolitan Police. He has kindly consented to speak, and I am sure you will be pleased to hear him.

Mr. W. WORBY BEAUMONT: I wish to thank you and your Council for sending me the invitation which enables me to be present this morning. Now, with regard to this paper, after hearing Mr. Fearnley's address, I felt it was hardly necessary for me to enter into a discussion on the paper at all, inasmuch as a large part of the whole of the contentions—apart from the figures, or rather from the interpretation of figures which Mr. Hamilton uses—has been answered by the remarks in Mr. Fearnley's address. Mr. Fearnley practically points out to you that you have not to consider only tramcars or omnibuses, but you have to consider the whole problem of the conduct of passenger traffic, and the whole of the other traffic to be conducted in any one city which you have to deal with. (Hear, hear.) Now, it appears to me that Mr. Hamilton has fallen into the error of thinking only, or rather of confining his vision only to his one prospect or purpose, and his hearing to the intelligence of the voices that have only one tune, and I think it is not necessary to go further into his paper than to begin at that point wherein he gives some incomplete quotations from a recent paper of mine. He says, "There is no doubt that considerable improvements in lightness and reliability have been embodied in the later forms of petrol omnibus traction as operated in London. In many quarters advocates of the motor 'bus have, without fully considering the matter, enthusiastically hailed this form of traction as the dawn of a new era in street transit," and many are assuming that the tramways are henceforth to be considered as back numbers. He then quotes, or mentions some remarks somewhat to that effect, by Lord Montagu, and refers to the paper of mine which I have just mentioned. Now, there is nothing in any paper I have ever written, or any remarks I have ever made, that lead me to condemn tramways as henceforth back numbers as a whole. I know very few places, towns or cities—London or any other—in parts of which tramways are not the best means of transit, but I know of a great many wherein the tramway is not the best means of transit. I am, therefore, not of opinion that tramways are as a whole to be considered as back numbers, and anyone who says that must forget that the same sort of thing was said within our lifetime with regard to candles. Later it was said with regard to gas, and later it was said with regard to electric lighting. But we are using them all, and not one of those industries, not even the candle maker, has been killed. With regard to the quotation from my paper, Mr. Hamilton says I consider that "due to the introduction of a light, high-speed internal-combustion motor, the advantage of rails in the streets has

Digitized by Google

almost completely disappeared." Allow me, if I may, to read the paragraph from which that is taken.

> "It is necessary to remind those interested in this subject that the original reason for the introduction of the tramways, which have become railways in the streets, was the smaller traction resistance on rails as compared with the traction resistance on the then common roads. That smaller traction resistance was then of much importance, because passenger transport on the highways was by means of horse haulage. Since that date two great or changing facts have come into action, firstly, electric power and the invention of the light, high-speed internal combustion motor have made traction resistance of comparatively small importance; secondly, the economic value of good roads for all classes of vehicle—public, private, motor, and horse—has caused general recognition of the importance of road improvement, and this, while it is attended with economy in road construction and maintainance, is further attended by a great reduction in the average traction resistance, so that the advantage which the rails had in the streets has almost completely disappeared, while the disadvantages where general traffic is great, have increased."

I contend that that paragraph is absolutely correct, especially with regard to London and London traffic, to which my paper was chiefly referring. Mr. Hamilton has further quoted from that paper, but quotations, I think, should be complete whole sentences or paragraphs, and not portions of them. (Hear, hear.) Mr. Hamilton also refers to a paper by Mr. W. Y. Lewis, read before the Society of Engineers. He quotes from Mr. Lewis, but what he quotes is only a general statement that every kind of way in existence is nearly equally bad, and that the system which Mr. Lewis was proposing should be better than everything else. The paragraph is only one which shows that Mr. Lewis damned the sins that he cared not for, and supported only the one that was his pet. Referring to me again, Mr. Hamilton says: "Mr. Beaumont rises above all sordid considerations of £ s. d.," and disregards various things. Personally, I do not see the necessity for saying that, and, secondly, it is not true. (Laughter.)

I have said that in some cases certain forms of traffic cost more than others, but that the cost is not the first consideration. That is to say, all those who are tramway engineers, and chiefly or particularly interested in tramways, must not look always at the tramcar and the tramway as though the only aspect concerning it was whether it, as a machine, was going to be a paying machine, disregarding all other considerations. It is quite possible that some of the arguments I have just heard from Mr. Littler might be perfectly true, if there were only one consideration with regard to traffic in London, namely, the possible paying results of the tramcars and the rails. But as Mr. Hamilton admits in several parts of his paper, the traffic of narrow streets and the possibities of narrow streets must be considered, the result being, for instance in London, that there are numerous streets where the traffic is so great—and he admits that is the reason as well as narrowness—that tramways could not be permitted, and will not be permitted. If that is the case—and he admits it—that reasoning should be applied, not only to the streets of London, but to other towns where anything like similar conditions exist. I admit that the greater part of the traffic of London is unparalleled, and one cannot help remembering on going to various places abroad, and seeing the various tramways and tramcars to which appeal has been made by many of those who have gone abroad for different Corporations, that when they come home they say "This and that kind of thing is used abroad, and it will suit us perfectly, but we must have this and that." But taking any one of a number of places in Belgium, France, or Germany, you will find traffic which is nowhere anything like that of the greater part of London; all of it is conducted so far as tramways are concerned in single-deck cars, and the speeds nowhere approach those quite common in London with its heavy cars. The reasons for the success in any one of those foreign towns are not all of them applicable by a great deal to the heavy vehicles and the heavy and dense traffic of London streets. I have made several notes on Mr. Hamilton's paper, and I find that he has charged me in one place with not having given figures. Now, there is an old adage with regard to what figures may do, and even if I had prepared any I should have felt, after I had heard Mr. Hamilton read his paper and make the corrections he did as he went along, that the interpretations from any figures I might give—just as they will be from any Mr. Hamilton has given, and those Mr. Littler has given—might be as various as the interpretations of theirs. (Laughter.)

There is one point with regard to costs. It would take a paper to reply to this table which Mr. Hamilton gives of the costs on page 18 of the paper, and there is no doubt that many would very much like to have some of the detailed figures that are in the hands of a few with regard to omnibuses. But to give figures with regard to the cost of running 3,000 omnibuses in London would only be to mislead anyone who thought of running 30 omnibuses in the country or somewhere else. Therefore, I say in dealing with figures like that it is only misleading to give any such set of figures. It would, as I have said, need a paper to deal with the subject. Now, Mr. Hamilton has given those figures with regard to omnibuses, and given a lot of figures with regard to tramcars. But really he admits himself in various parts of the paper how extremely difficult it is to give anything like averages that are a truthful representation of particular cases. He has mentioned, it is true, that tramways in many places are earning big profits, etc., but I did not notice that he said that about 26 per cent of those referred to in the tables frequently published by THE TRAMWAY AND RAILWAY WORLD are either making no profit at all, or calling upon the rates to make up the deficiencies. In conclusion, there is perhaps one point with regard to Mr. Littler's statement about the dangers of the omnibus, with which I might deal. There again figures are misleading. It is true that something like seven times the number of fatal accidents were attributed to motor omnibuses as to tramcars in London. It is not, however, true, that the omnibuses are necessarily seven times more dangerous than the tramcars. Although I know it is a heavy task to suggest, if Mr. Hamilton or Mr. Littler will read over parts of the evidence given before the Motor Accidents Committee—at all events it was that when it started—he will find a very great deal that will make him hesitate before he again gives even those figures. I wish not in the least degree to be disrespectful to Mr. Hamilton, for I know he has intended to give you a paper of real value, but in conclusion I would say—though I do not care more about motor omnibuses, or tramcars, or trolleys, except as a general traffic question—that I hope Mr. Hamilton will soon get over his attack of "motorphobia." (Laughter and cheers.) There is one other little matter. Mr. Hamilton describes me as the technical adviser to the associated London omnibus companies. It should not be that, sir, but technical adviser to the Commissioner of Police of the Metropolis.

The PRESIDENT: Yes, we will make that correction.

Alderman F. SMITH (Liverpool Corporation Tramways Committee): Thank you, Mr, President, for calling on me, but I really feel after the three first speakers have taken the enormous time they have—we have over 100 gentlemen coming from all over the country, full of information and enthusiasm—it is rather hard those gentlemen should be detained by any observations of mine. I myself thank Mr. Hamilton for his very capable paper, and the trouble he has taken in putting the facts together, but what are you faced with? You are faced with a serious competition and we are going to give 20 minutes to the whole hundred gentlemen for the consideration of it. Bad business. (Hear, hear.) I am downright glad that London is fairly up against a stiff proposition—they have got motor 'buses there, and they jolly well deserve them. Against all the advice that could be tendered to them, they incurred a huge capital expenditure; they have run the thing sentimentally from many points of view, and they are now getting hurt and deserve it. It will brighten them up. I remember when I was at a dinner a little while ago, a man who was proposing the toast with which my name was coupled, said he was proposing the toast of the "chairman of the slow-moving vehicles in Liverpool." (Laughter.) We ought to move our tramcars quicker, we ought to abandon sentiment and become what Alderman Littler described as "fare-hunters"—that is what we are out for—tempered with due regard to the needs of the people whose interests it is that we should properly serve. But when you come to a paper like the one we had yesterday from Leicester, and see the way in which they laud us with sentiment, and get things quoted against us—I am reading from the paper—"Poor blind and crippled persons residing in the borough are carried free of charge, but the Corporation accept no liability for third party accidents, an indemnity being given by the local philanthropic societies against third party risks." (Laughter.) What are the facts justifying that statement which, mind you, has been hurled at us?

A MEMBER: On a point of order, sir, is Mr. Smith discussing the paper?

Alderman SMITH: I am a Leicestershire man. I am dealing now with a phase of traffic that injures us.

The PRESIDENT: Will you deal with Mr. Hamilton's paper, please?

Alderman SMITH: I am dealing with the subject of Mr. Hamilton's paper. If you want me to read extracts from Mr. Hamilton's paper I am right off. We have had it circulated amongst us, and we have had an exhaustive 30 or 40 minutes' summary. I am going to make my point clear, if you will permit me to do so. We find they carry 32,907,795 passengers in Leicester, and only 103 passes have been issued to the blind, and 98 to cripples.

The PRESIDENT: It is Mr. Hamilton's paper I want you to discuss.

Alderman SMITH: We are up against the whole subject—the discussion is up against the whole question, and how sentimentally or otherwise we are handling our trams. We shall have undoubtedly strong opposition such as we deserve in places where the motor 'buses can get in and serve a remarkably useful purpose. We have got to abandon other than proper commercial methods, tempered with due regard to the interests of the municipality, if we are going to live. I do not believe that the tramcars will be ended, but I do believe that there is a great likelihood of them being handed over to commercial people to run as a commercial proposition. If motor 'buses go on as they are likely to go, daily and almost hourly improving, they will run us commercially off the road when municipally we carry men 14 miles for 2d. Those are the points that I want considered. I am old enough to remember a dog cart literally drawn by a dog, and an ox drawing a cart; and with electric cars we have knocked out the

Digitized by Google

horse drawn tramcar; we have knocked out a great many of the cabs; we have knocked out horse traffic. Now the advance of science has brought to us a strong competitor, which we have solidly and seriously to consider But generally you are in a hilarious mood, and something amuses you far more than it amuses me. I feel bitterly, I have spent two days here to listen to the papers that have been read after having been already circulated, and all you gentlemen, I say packed with information, packed with local knowledge, are unable to express your opinions. I should move if it were any use—I know it is not—that the whole of the afternoon be given to you gentlemen for discussion, so as not to miss a chance of saying something on this important paper.

Mr. A. Baker (Birmingham Corporation Tramways Committee): I think that we shall all agree that this paper is one of the utmost importance to tramway operators, and I have heard it seriously suggested, even before Alderman F. Smith spoke, that it would perhaps be advisable and acceptable to a good many of our members if this discussion could be continued during the afternoon. That, of course, is a matter for the meeting to decide. But while I beg to thank Mr. Hamilton for his paper, and also for the very useful information it contains, some of which will be most valuable in refuting arguments in favour of motor omnibuses against tramcars, and while I agree that the time has not yet arrived when motor omnibuses are likely to supersede tramways, I do wish to utter one word of warning against an error that we may fall into, and that is, that we may feel that tramways are going to serve the situation for all time. Now, I have been connected with tramways, as many of my friends and colleagues know, for more than 30 years, but I should feel it a very great mistake if I came to the conclusion that tramways were going to fill the bill for all time. All scientific history is against it; we have only to think of aeroplanes and Marconi telegraphs, surely, to kill an idea of that kind. What we have, as municipalities, to consider is the best means of serving the traffic problem, whether by motor 'buses, tramcars, or aeroplanes, if you like. Our first duty is to maintain the control of our streets, and to be the supreme traffic authority, whether by tramcar, motor 'bus, or any other means of locomotion. I feel myself that although at the present time tramways are not likely to be superseded, we must not shut our eyes to the fact that inventions may come along that may even put tramways in the shade at some future date, and therefore it behoves us as tramway men in the interests of our respective Corporations to keep our eyes open on coming events, and to be right up-to-date in all scientific improvements in regard to the carriage of passengers in our streets. That is all I have to sav in three minutes. (Applause.)

Councillor H. Heather (chairman, Leyton Tramways Committee): I represent one of those districts contiguous to Alderman Littler's, Leyton, and I would like to emphasise and bring the feeling of this meeting back again to the question of the equality of treatment, which, although it has been touched upon this morning, I do not think has been adequately discussed. And I, for one, should be glad to come here this afternoon and give up going to visit the works I had thought of going to, because it is a subject of extreme importance to us upon the environs of London. Some of you will remember that at last year's Conference at West Ham, I ventured to say in regard to this equality of treatment, that human ingenuity would find a means whereby the present condition of things in London and its environments would be extended to the great urban districts of the country. (Hear, hear.) I know that I was met with cries of "No, no," but I have heard recently that the great London combine and a proposed provincial company intend to move Parliament to get those very powers that the provincial towns have of licensing the public vehicles in your streets and towns—that those powers shall be taken away from those cities and towns, and that they shall be vested in a central office in London, or shall be controlled from London, through Home Office representatives, in your towns and cities. I have been told that that is a secret, undercurrent object which the great London combine, with another company that has been mooted, will be going for. Now, I can imagine, gentlemen, when such a proposition comes before you as a concrete proposition, coming before Parliament, the tones of indignation with which it would be assailed by all you gentlemen who come from districts other than those in London. I can imagine in what glowing terms you would describe the injustice of such a thing, that it could not possibly be allowed; you would move heaven and earth to wipe that or any such proposal off the face of the earth. You would seek your own Members of Parliament. I can imagine the feelings with which such a proposal would be received, and I know how you would lobby your own Members of Parliament in the House of Commons. You would send your representatives up to Westminster to do a good deal of lobbying; you would look to local influences, and you would get to play very soon a concensus of opinion that such a thing could not be allowed. And why? Because of its inherent injustice. You would contend that the control of the traffic should be in the hands of the representatives of the people on the spot. Now, if the proposal would be an injustice to Birmingham, to Glasgow, to Leeds, to Hull, to Bradford, and all those other cities, is it not an equal injustice to our urban areas round about London? (Hear, hear.) What differentiates the principle of justice as between a town that is on the environs of London and one that may be 20 miles away? The place I represent—Leyton—I know is a small part of London. It is a mere nothing, but it has 128,000 inhabitants. I reckon if some of you had 128,000 inhabitants you would reckon yourself a very fine, big, and important place. We are humble, we are next door to and are smothered by London—that is the long and the short of it, but we have the honour of belonging to London, and we have this very great disadvantage—and it is a disadvantage. My point is this—if it would be an injustice to impose this burden upon your provincial cities, how is it that we allow this injustice to be continued in the environs of London?

A Member: Because you belong to London.

Mr. Heather: But that does not make it more justice. I thought justice was impartial. I thought justice was high above party and above districts—that wherever you were you would get the same measure of justice meted out to you. How has it affected us in my area and two or three others? I have some figures here. Croydon has dropped from a profit of £17,304 in 1912 to a profit of £10,586 for the year ending April, 1913; I am told it is going to be very much less if anything at all in the next year. Ilford dropped from a profit of £786 to a loss of £2,015; Leyton from a profit of £3,086 to a loss of £812, and this year it will be vastly different again on the wrong side, approaching £4,000.

A Member—Bad management.

Mr. Heather: A member says bad management. Well, he is not serious. You all know how the London County Council figures have dropped from a profit of £240,630 to a profit of £497. Walthamstow dropped from a profit of £4,496 to a loss of £2,800; West Ham, from a profit of £4,527 to £3,388 loss. Now my point is this. Here are these great losses, great to us. You will get the same thing if any such conditions prevail in your own areas And there is this proposal, this insidious proposal, which will come along, whereby the injustice which is meted out to us in the London areas shall be spread out all over the country. Now, I say to you if you are wise, if the Conference is wise, you will go back to your towns and cities and help us in the London areas to get equality of treatment—that is all—equality. We do not say abolish the 'buses, the 'buses must be there, they are needed for London, absolutely needed for London, there is no question about that. I have heard of their being wiped off the face of the earth; that is nonsense. They are there and they will stay and get to be profitable, but I say mete out to us in regard to road maintenance, in regard to rating and other things equality of treatment. Do for goodness sake agitate, agitate, agitate, and get equality of conditions, and then we can do well. (Applause).

Alderman J. Trumble, J.P. (Croydon Tramways Committee): I congratulate Mr. Baker on his really sensible speech after the two long speeches we had. The question of Mr. Hamilton's paper was as to the best means of providing for urban traffic, and surely there is one point that has been omitted from every speech, and that is the public, who are the best judges. And you find in London and other places that a large proportion of the public do prefer to ride in motor 'buses to the trams. We cannot help acknowledging that difficulty. Whatever may be given to towns we should have to consider the wishes of the public, and they are really the final arbitrators on the question as to which is best, because the people will have exactly what they want, even if they are losing a farthing in the £ on the rates.

Mr. C. J. Spencer (general manager, Bradford Corporation Tramways): May I say one word? It seems to me in this controversy there is a tendency among tramwaymen to urge the glories of the past history of tramways as a reason why people to-day should not use motor 'buses. On the face of it, that seems to me to be a very poor defence of tramways, and is weakening in its effect. Surely our case is strong enough. Mr. Hamilton gave you an excellent paper. I think the figures have not been touched upon by any speaker. That is our case—not because we have spent a lot of money on our tramways, not because we have a glorious past, but because we believe we are the fittest people to carry the people to-day. On the point of the last speaker, he says the public are the judges. True. Remember the sure thing to-day, especially in London, is this—the 'bus comes there. and it is taking the cream of the traffic, leaving the skim milk for the tramways. Never so far as I know has a 'bus company taken on a town of any considerable size and proved that it is as efficient as a tramway, when the tramway is not there.

The President: I am sorry to have to close the discussion. I think it is impossible to accept the suggestion of continuing this afternoon, for this reason: 110 or 120 gentlemen have made engagements to visit various firms, and I think we are in honour bound to keep those engagements. I ask you to give a very hearty vote of thanks to Mr. Hamilton for his paper, which has provoked this important discussion, and I have to say he will be pleased to reply in writing to the various points which have been raised, and if any gentleman would like to make a further point, or anyone who has not spoken would send his views in writing to Mr. Hamilton, he will deal with it in his reply.

The vote of thanks was carried with acclamation, and the Conference closed.

[Mr. Hamilton's reply has been received since the Conference, and is given on the following page.]

## MR. HAMILTON'S REPLY TO DISCUSSION ON HIS PAPER.

Mr. President and members of the Association,—I regret the time at the disposal of the Association did not permit of my replying briefly before the Conference concluded. It is also a deeply regrettable fact that the time arranged for discussion of the paper was so inadequate, with the result that it was not possible for the opinions of many members, both official and members of Council, to be ventilated.

So many expressions of a desire to continue the discussion at some future time were made on the following day at the annual meeting, that I wish to repeat the statement I made there, viz., that I shall be very pleased, if asked by the Executive Committee, to raise the question again, if necessary, with any supplementary matter which may be available. A periodical review of the prevalent method of passenger traction in cities, and a comparison with other forms, is of the utmost importance, now and at all times, to the great municipalities of the country, and to all investors in tramway undertakings.

I should like to thank the previous speakers for the extremely kind expressions of their views in connection with the paper. I think their appreciative acceptance of the matter, however, is largely due to the importance of the subject, rather than to the way in which it was presented. I regret that the claims upon my time prevented the completion of the paper, and its issue to the members, until the week preceding the Conference.

Mr. Littler placed his views before the meeting at considerable length, and perhaps in some degree travelled over the same ground as I had found it necessary to do. The question, however, of Tramways *v.* Motor 'Buses is so extremely urgent in London and surrounding districts, that he was fully justified in putting on record the interesting particulars, even if they somewhat overlapped, upon which he based his deduction and arguments. They will be found to be most interesting reading. The text of his remarks, and also those of Mr. Councillor H. Heather, really present a special aspect of the question, and an opportunity for its discussion at a suitable and early date should be provided by the Association.

The assistance of the Municipal Tramways Association should be afforded to the various metropolitan municipal tramway undertakings, all of whom at the present time are being seriously affected by the inequality of conditions under which tramways and motor omnibuses are being operated. I commend to their serious consideration the remarks of those who spoke representing the London districts.

Mr. Worby Beaumont, who as the guest of the Association and the writer of a recent paper on "Urban Passenger Transport in Cities" was asked to speak on the matter, in my view seemed to shirk the task of making any serious criticism of the facts and figures relating to tramways and motor 'buses which I placed before the Conference.

His first remarks were that Mr. Fearnley's address rendered it hardly necessary for him to enter into a discussion of the paper at all. I fail to find in any portion of the presidential address the slightest suggestion that any figures and deductions in my paper were in the slightest degree incorrect. As a matter of fact, before writing the paper I communicated with the President, and he agreed that in accepting the figure of 10d. per 'bus-mile I should be in general concurrence with his very limited experience of new motor 'buses.

It is not, of course, considered to be the right thing to criticise the President's address in any way, but as it has been quoted against me I think I may fairly claim that his views were entirely in agreement with the general survey of the situation which I placed before the Association.

If Mr. Beaumont refers to Mr. Fearnley's personal views relating to the possibility of an interesting and valuable experiment being carried out "somewhere" by substituting motor 'buses for tramcars on some route which requires renewals of rail, then I refer him to the further remark in which Mr. Fearnley says: "If the motor or trolley vehicle is anything approaching in its completeness, reliability, and capacity the claims put forward by its advocates, what hesitation need there be in adopting such a course?"

Further, as tracks are wearing out in Sheffield quite frequently, and as Mr. Fearnley, so far as I am aware, has never made any proposal of this kind to the Sheffield Corporation, his views must be held to be in entire agreement with the summing up of the paper. I am sure everyone would be much interested to see the result of such an experiment when Mr. Fearnley has sufficient confidence to make the suggestion and the Corporation of Sheffield the necessary courage to carry it out.

Mr. Beaumont now states that his paper chiefly referred to London and London traffic. Since then I have again gone carefully through his paper, which is "A Note on Road Passenger Transport in Cities," and must disagree that he has confined his observations in any way to London. "London," he says, "is perhaps an extreme case, but there are several cities or towns in which the tramways have become an incubus."

As an earnest searcher after the truth, I endeavoured to look on the matter under consideration with an open mind, and to give effect only to facts and figures which my experience and the experience of others throughout the country had proved to be correct. I was, therefore, deeply disappointed to find that the principal exponent of motor 'buses at this gathering had no criticism to offer on the deductions, and no figures of his own to put forward, but simply repeated the stereotyped sneer as to what figures may do. I feel sure that Mr. Beaumont, after reading his remarks as I have done, will feel that a champion of the motor 'bus must be better equipped with facts and figures before he can expect that his statements can be accepted by the members of the Municipal Tramways Association and the public generally.

The one figure upon which Mr. Beaumont did venture was that whilst I referred to the tramways which had big profits, I did not take any notice of the 26 per cent. of those referred to in the tables frequently published by THE TRAMWAY AND RAILWAY WORLD which were making no profit at all, or calling upon the rates to make up their deficiency. I have gone most carefully through the records of THE TRAMWAY AND RAILWAY WORLD, and find that the details of 83 undertakings are frequently published there. Of this number there are 13, *i.e.*, 15·7 per cent., which show a deficiency on the year's working, and 5, *i.e.*, 6 per cent., which show no deficit and no surplus. The total of these two is 21·7 per cent.

In the Board of Trade return for 1911-12, there are 172 tramway undertakings which are owned by local authorities. Of that number there are 22, or 13 per cent., which require rate relief. These are very different figures from the 26 per cent. referred to by Mr. Beaumont, and it may be questioned whether, if full consideration were given to the rates provided from the operation of the lines and the value of the road surface maintained by the different undertakings taken into account, it might not be shown that in many of these cases there was a profit instead of a deficit on their working.

I have applied the general figures used in my paper to the cases of the 22 towns which are referred to in the Board of Trade return as having a deficit. I find that if credit is given for road maintenance and for rates, and also for profit on the price at which current is supplied to the tramways, the deficit of £62,000 per annum from the 22 undertakings is reduced to £12,315 per annum. On the other hand, if motor 'buses were installed—which seems to be the panacea proposed for the present deficit, then the loss, instead of being £12,315 per annum, would become a loss of £145,140.

Mr. Beaumont rather suggests that the statement as to the dangers of motor 'buses is exaggerated, and states that if Mr. Littler and I read over parts of the evidence given before the recent Committee on Motor Traffic, we should hesitate before relying on these figures. May I say I have read over the greater portion of the evidence given before the Motor Traffic Committee, and that my deductions as to the dangers of motor 'buses as compared with tramways are drawn from the official evidence of Colonel R. C. Hellard, head of the London Traffic Branch of the Board of Trade. He states, in answer to query 16,725, that the number killed per million passengers on tramcars is ·041, whilst the number killed per million passengers on motor 'buses is ·290. These figures are surely above any question.

May I say that, on the whole, whilst I appreciate very much Mr. Beaumont's courtesy in referring to the paper and myself, I was deeply disappointed to find that his remarks dealt in trifling observations with regard to extracts which I had made from his paper, and vague generalities, instead of really criticising the figures and deductions which I presented, or substituting some genuine solid views in opposition to these.

The other speakers are generally in agreement with the views I put forward, and their remarks speak for themselves. I agree with them that whatever the form of traction may be, the municipality should maintain the control of the streets.

Alderman Trumble, of Croydon, stated that the previous speakers and the writer of the paper had omitted one point, viz., that it is the public who are the best judges, and that you find in London and other places that a large proportion of the people prefer to ride in motor 'buses rather than in trams. I presume it is not possible to make the object for which a paper is written quite clear to everyone, but I thought the whole argument of the paper did show that if motor 'buses were run instead of tramcars in towns where it was possible to run either of them, the cost of travelling would be double that for trams. I have yet to find the public who are willing to pay a double fare instead of a single one, and this is the final result of the whole question.

The choice as between rail *v.* non-rail passenger transport in cities, when considered from every point of view, must be decided in favour of the former, which, with the many improvements in types of body, trucks, equipment, and rail construction, shows to-day no symptom of obsolescence.

## LUNCHEON ON THURSDAY.

The delegates and guests at the Conference were again entertained to luncheon on Thursday at the Royal Victoria Station Hotel by Sir William Clegg, J.P., chairman, and the members of the Tramways Committee of the Sheffield Corporation. The Right Hon. the Lord Mayor presided, and there was a large and distinguished company present, the public and business activities of the city being well represented.

The toast of "The King" having been duly honoured,

Digitized by Google

Mr. W. J. SQUIRES (member of the Highways Committee of the London County Council) proposed the toast of "The Chairman and Members of the Sheffield Tramways Committee," saying: I have been asked to propose a toast which I venture to say will be received with acclamation. Let me at first say how sorry I am that the chairman of the Highways Committee of the London County Council, Sir Edward White, is not able to be with us this week. Sir Edward has had a very serious illness, and will have to be released from duty for something like two or three months more. When one is asked to give the toast of a committee of gentlemen like the Tramways Committee of Sheffield, it is almost like talking about oneself; but there is a slight difference between the Sheffield Tramways Committee and the London County Council Highways Committee. We have heard during the last day or two the very great advantages which you as provincial towns and cities have over the great metropolis, but to day we are here primarily to bear witness to what the Tramways Committee of Sheffield are able to do. First, let me say that hospitality seems a very great point of yours, and accommodation for the public is certainly one of the things you understand. Your tramway service in this city is excellent, and when you combine such things as business acumen so well with the social side, then you must have a very good Tramways Committee indeed. I think it is a regrettable thing that Sir William Clegg, the chairman of the Committee, is not with us. I express my very great sorrow that I have not had an opportunity of meeting him. I have read of Sir William Clegg and I have heard of him, but I have never had the pleasure of meeting him yet. I am always happy in Yorkshire, and possibly when I tell you one of the very great reasons for that you will say "No wonder." Yesterday was the celebration of the fortieth anniversary of my wedding day with a Yorkshire lady; I was married in 1873 just outside the city of York, and but for circumstances I should have had my wife with me to-day. But there are other reasons why I always feel at home in Yorkshire. A little while ago I was at Huddersfield attending another Conference of Building Societies, and there one thought of what the Yorkshiremen and Yorkshirewomen have uppermost in their minds. It is, I think, my friends, to make you happy. This Conference ought to be happy indeed. I have the pleasure to-day of not having to limit anything I may say in support of this toast. The President of the Municipal Tramways Association is on my left, and I am sure the Conference would not wish me to be limited, for I want, if I may, to compliment the Tramways Committee of Sheffield on what they have done and on what they are going to do. There are certain periodicals which are published which do give to us and to the world what the different tramway undertakings are able to do. Sheffield is in rather a unique position; you have taken a step which I suppose a great many other undertakings would like to imitate. You have added, I understand, a motor 'bus service to your tramways. I am not going to discuss that point this morning, and my only regret is that we were not able to finish the discussion of that important question at the Conference this morning. But Sheffield through its Tramways Committee is doing what other provincial towns and cities would like to do. Whether it is a right step for tramway authorities to take in utilising motor 'buses is a matter which you know best yourselves. But the success of the Sheffield tramways, and what I have seen of the Committee, show me that you must have a very unanimous and harmonious Committee: I hope it is so. I hope that the Sheffield Tramways Committee is very much like what we at the present moment are on the Highways Committtee of the London County Council. It was not always so, but unanimity of purpose irrespective of party or politics is the right course for a Tramways Committee or any committee of a great Corporation like this, and you are bound to get better work and the ratepayers will reap better benefit from such undertakings if that is the case. Now my Lord Mayor, I had the opportunity of saying a few words to you last evening; I congratulate you, sir, on having consented to preside over this gathering to-day. It is a very great pleasure to a Conference to know that the Lord Mayor of the city in which they are meeting in congress does grace their assemblies. I have known other places where it has not been possible to get the leading citizens to take any part whatever in a Conference; happily that is not so with Sheffield. We have received from the Corporation here, through the Lord Mayor, through the Tramways Committee and Aldermen and Councillors, everything that any man or woman could desire or expect. (Applause.) On behalf of the London County Council, as one of its delegates, may I tender to the Tramways Committee and the whole Corporation of Sheffield our best thanks for the kindness which you have proferred us. To them, through my humble self, on behalf of the members of the Conference, I think I can say this, that they are unanimous in passing this verdict, that Sheffield has risen to the occasion and has not been beaten by any other place in which we have ever held our Conference. (Loud applause.) I am not stretching a point when I give this expression of opinion—at Sheffield, at Leeds, at Bradford, and in many other parts of the country, a very noble example has been set, an example of going forward in municipal enterprise, and that is amplified to me in this city of Sheffield. There are representatives here from many other important centres, but I am sure they will not dispute my contention that Sheffield is showing an example of what municipal life should do and can do through its Tramways Committee, of which we happen to be the guests to-day, and is loyally and well doing that work or endeavouring to do that work to which the Corporation have put their hands. Let the Tramways Committee of Sheffield go on as they have been doing, and I feel sure of this, that the success of tramways, not only in Sheffield but in other parts of the country also, is not going to die out for some time to come. (Applause.) I have the honour to couple with this toast, the name of Alderman Bennett, a member of the Sheffield Tramways Committee. I have nothing more to add, but to thank the Committee for the opportunity given me of saying a few words, and I have on behalf of the Conference, of every member of the Conference, to thank Sheffield for the very hearty welcome which has been so generously accorded to us. (Loud applause.)

Alderman C. F. BENNETT (member of the Sheffield Tramways Committee), who was received with enthusiasm, in replying to the toast, said: No one feels more sorry this afternoon than I do at the absence of Sir William Clegg. Had Sir William been with us, I should have been a mere humble member of the Sheffield Tramways Committee present at our gathering this afternoon; as it is, I have to undertake a task which I know perfectly well he would have performed in a far better manner than I shall be able to do. That is, the task to thank the proposer of this toast for the generous way in which he has submitted it to you and for the kind things he has said about us, the Tramways Committee, and to thank all you ladies and gentlemen for the way in which you have received and responded to that toast. The proposer told us—and I was glad to hear his words—that our tramway service in Sheffield was an excellent one. I am bound to admit that we are perhaps a little bit proud of our tramway undertaking. I would like you to agree with me in saying that perhaps we are entitled to be a little bit proud of it. I must ask you to excuse me for taking up a few moments of your time, but I should like to refer to one of the causes to which we attribute that success to which you have been good enough to refer. In the first place, in our city we early decided the principle which every municipal tramway undertaking must decide at the beginning—as to whether or not our tramway system should be worked in the interests of cheap and rapid transit or in the interests of a profit-making concern for the benefit of and in aid of the rates of the city. We adopted what I think was the right course, and one which I think has been confirmed since by the action of many other municipalities. We said the right course was to work the tramway system in the interests of cheap fares, and that relief of the rates was only a secondary consideration, although an important one in connection with the work of municipal tramways. In the next place, we early adopted the principle of a penny universal fare. We adopted the penny system of fare from the centre of the town to any of the tramway termini on any of its boundaries where the tramways run without any regard whatever to the distance which that tramway covered. We think that has had something to do with the success which has attended our tramway system. We then followed the example of a great city in Scotland—I know we always follow a good example if we follow a Scotchman—we followed the example of the great city of Glasgow in adopting a system of halfpenny fares. I am not going to enlarge in any way on this system, more than to say that its adoption has been satisfactory. It has met with the approval of the Sheffield people, and from a financial point of view has been satisfactory to us as members of the Tramways Committee. I do not wish to trouble you with many figures, but last year we carried no fewer than 21,731,910 halfpenny passengers upon our tramways, and the receipts from those halfpenny passengers last year amounted to no less a sum than £45,274 16s. 3d. I think those figures alone will show you that in Sheffield at any rate the halfpenny tram fare has been a success, and has worked in a satisfactory manner. In addition to that, we early adopted what I think all you engaged in connection with the great tramway undertakings of the country will say was a proper and a sound financial position. We decided that not only should all repairs be paid out of revenue, but we also decided to pay the whole of the renewals out of the current year's revenue. We have carried out that system from the beginning. I think everyone will agree with us it has been and is a sound financial system on which to work every such undertaking. Last year the expenses of repairs and renewals of our tramways system amounted to no less than £49,389, every penny of which was paid out of revenue. (Hear, hear) Then we adopted another system in Sheffield—one of being our own insurers, and that has given us an extra financial advantage, and saved us money, instead of spending large amounts on premiums to different insurance companies. Then we have always adopted the principle of being generous to our men, both as regards their wages and as regards their hours and conditions of labour, and also as regards their holidays. I think it has been an advantage to us to have so acted. I do not think that at any time we have less than 800 or 1,000 men on our books seeking employment under the Tramways Committee of the Corporation. I think that fact shows that the Tramways Committee has been generous and has acted in a fair manner towards its employees. In addition to that we have had two very great advantages. We had the advantage of having Mr. Fell, the present chief officer of the London County Council Tramways, as our first general manager of the Sheffield tramways undertaking, and I may say this—

Digitized by Google

the members of the Tramways Committee particularly welcome the presence of Mr. Fell again in Sheffield, and not only his presence, but also that of his good lady, Mrs. Fell. As regards our second great advantage, there is your out-going President. Certain things may occur in future with regard to Mr. Fearnley, and I do not want to say too much in reference to that, but I do say this, that no undertaking in the country has a better general manager than we have. (Loud applause.) I also want to say in Mr. Yerbury and the heads of departments we have excellent men doing good work; and it is only common justice to say we are served by an earnest, hard-working, and thoroughly competent staff of employees in every branch of this department. I want to say that our relationships with our men are most harmonious. We have had occasionally some slight differences with the men, but those differences have happily been settled, and I venture to think that we have only been the better friends after those disputes have arisen. I think I have said enough in connection with our tramways undertaking. I should like to have told you one or two little incidents in connection with that undertaking, but perhaps they may be "chestnuts." Therefore with your leave I will conclude by saying this. The Tramways Committee hope that every delegate who has done us the honour of attending this Conference in this city has had a happy and a pleasant visit, and that it will continue to be a happy and a pleasant visit until they go home again at the end of the week. I should also like to say how specially we welcome the presence of so many ladies who have done us the honour of coming to visit Sheffield on the holding of this Conference. I hope when they all go back again to their homes, refreshed and invigorated by the salubrious climate of Sheffield, that they will return feeling they have enjoyed their visit, and that the people of Sheffield are always ready to welcome anyone who is good enough to come to see them. And I hope, when in the future you hear the expression which is sometimes used by men from Sheffield, you will rather regard it as a term of affection than a term of reproach. I thank the proposer of this toast for his kind words, I again thank you, ladies and gentlemen, on behalf of the Tramways Committee of this city, for the way in which you have responded to the toast, and I desire to convey to you how pleased we have been to see and welcome you on the occasion of your annual Conference. (Applause.)

## VISITS TO WORKS, TRAMWAY STATIONS, ETC.

In the afternoon, many of the delegates and their friends visited various works and other places of interest in Sheffield. The city is, of course, known throughout the tramway world as the home of several firms famous for the manufacture of special trackwork, and these firms kindly threw open their establishments to those attending the Conference. The works visited included those of Messrs.

Edgar Allen and Company,
Hadfield's Steel Foundry Company, and
L. Osborn and Company (The Titan Trackwork Company).

Here the visitors were hospitably received and were shown the methods of manufacture, and inspected work of various kinds in progress. Other places visited included the Neepsend electric supply station, the tramways power-station, Queen's Road car works, the Shoreham Street central car depot, and the Applied Science Department of Sheffield University.

The guests were conveyed by motor omnibuses, chars-a-bancs, and tramway cars, which were placed at their disposal by the tramways department. These motor vehicles were used throughout the Conference, and greatly facilitated inspection of the city and travelling to and from hotels, the town hall, etc. Sheffield Corporation now have 10 Daimler omnibuses, and this number will shortly be increased. As the visitors discovered, the cars run with great smoothness, and they appear to be giving excellent results. The Daimler Company provided a single-deck vehicle elegantly fitted up, and Mr. W. A. Stevens brought down from London a Tilling-Stevens petrol-electric omnibus, which was closely inspected.

## THE ANNUAL DINNER.

The twelfth annual dinner of the Association was held on Thursday, September 25, at the Royal Victoria Hotel, Sheffield. The President of the Association, Mr. A. R Fearnley, occupied the chair, with the Lady Mayoress and the Rt. Hon. the Lord Mayor on his right, and Mrs. Fearnley and Councillor A. J. Hobson, ex-Lord Mayor of Sheffield, on his left. The company was large and representative, including most of those who had attended previous functions in connection with the Conference, and other guests. During the evening musical selections were agreeably rendered by Miss Ida Bloor, Mr. Robert Charlesworth, and Mr. Harry Heath (Sheffield tramways department), with Mr. Arnold Bagshaw as accompanist.

After the toast of "His Majesty the King,"

Alderman C. F. Tetley (chairman of the Leeds Tramways Committee) submitted the toast of "The Lord Mayor and Corporation of the City of Sheffield." He said: I can hardly tell you how much I appreciate the honour of being asked to act as your mouthpiece to-night, and as the representative of one great city in Yorkshire to propose the health of the Lord Mayor and Corporation of another great city in Yorkshire, and to wish continued success and prosperity to every undertaking that has its home in the city of Sheffield. I am very glad to be able to offer to Sheffield every sympathy and goodwill that can be conveyed from one civic body to another, and I am quite sure that the city which has received us to-day and yesterday so hospitably and so beneficently, and the Lord Mayor and Lady Mayoress who entertained us so well this afternoon, with our ladies, deserve at your hands a most hearty vote of thanks. I suppose in all great cities the aims and aspirations of the citizens are very much the same. I suppose they consist chiefly in this, that external commerce should be enlarged, that internal trade should progress greatly, and I have no doubt in the hearts of many here the deepest wish is that there should be a magnificent and scientific development of the great industries that flourish in this city. The main parts of both Sheffield and Leeds lie at the bottom of valleys, and those valleys have rather steep sides, and I suppose the chief aim of the members of the Sheffield Corporation to-day is to take the people of Sheffield up those steep sides away from the bottom of the valley, and convey them out into the beautiful surroundings which exist round about Sheffield as they do about Leeds. And here, when the tramway has done its duty, the difficulty of other members of the Corporations begins, because I am quite certain of this, that in Leeds, and possibly in Sheffield, the chancellor of the exchequer of the local body considers that the tramway affords a great deal too convenient an exit from the city, and that if the facilities of the tramways are much increased, the run-away ratepayer will be largely increased also. In the words of a local newspaper which I saw this afternoon, Sheffield has been to a certain extent a more or less hungry wolf, and has swallowed Tinsley and some other adjacent villages. Leeds, I understand, is a much more hungry wolf, and is going in for a much more extensive scheme. The difficulty that everybody has to contend with who is interested in the finances of the city is, first, whether it is right to prevent the ratepayer being a run-away ratepayer, and secondly, if he is a run-away ratepayer, what is the best means of recapturing him. I may congratulate the more or less hungry wolf of Sheffield, whose appetite has to a certain extent been stayed, from the hungry wolf of Leeds, whose appetite has not had the slightest chance of being stayed as it ought to be. I am sure that the prosperity of Sheffield is bound up in the prosperity of the district, and that all you can do to help yourselves will be sure to help the districts round about. Our products are not quite the same as yours; our products are eminently peaceful. We send clothes abroad, we send cloth abroad, we send shoes abroad. We hope that as our trade abroad prospers, so your trade, even if it is less peaceful than ours, may also be prosperous in the countries where you trade. I consider that much of your warlike exports is as necessary to those countries as wearing clothes, as our more peaceful exports are; for I consider not only is it right for an individual to have an opportunity of doing the best he can for himself, but also independent organisms of the community are compelled to maintain that independence and do their best to maintain and assert their position in the world. I recognise that part of your aims and desires is not only to preserve but to increase the amenities of your city. I am quite certain that very much can be done to improve the amenities of great cities in the north of England. In that connection I hope you as a University city will derive great benefit from the scientific researches of the University and the great manufactures that somehow or other are helped, or ought to be helped, by the University. It has long been the custom to cry up the forms of rule of thumb in dyeing and in tanning, but I hope that, thanks to the researches of the various Universities in England, and the University of Leeds specially, with its leather department and its textile department in particular, as far as those two trades are concerned, that any desire to stick to the rule of thumb will disappear entirely. There is one great problem which assails us all, and that is how to get rid of the terrible pall of smoke that hangs over these cities. We look to the very greatly extended use of gas as a fuel. I would particularly congratulate the metallurgical department of the University of Sheffield upon the researches it has made into fuel and into the composition of metals. I am quite certain of this, that they will lead to great economies, not only of fuel but also of raw material. In the researches into fuel by the sister University of Leeds great advantage is likely to accrue in the use of gas, and I may hope that not only the great gas companies but the great municipalities also will encourage the use of gas for domestic purposes, and that we shall really see before many years have elapsed a very great improvement in the state of the atmosphere above us. Now, I wish success to Sheffield, not only as a trading town, but as a University town also, and I wish to the Lord Mayor of Sheffield and the Lady Mayoress a continuance of health and strength in their arduous duties. I am sure you will all wish to drink with me to the great prosperity of the city of Sheffield and of its

Digitized by Google

enlightened governors and of the Lord Mayor and Lady Mayoress. (Loud applause.)

The Right Hon. the LORD MAYOR OF SHEFFIELD, responding, said: I wish in the first place to thank Alderman Tetley for the exceedingly kind words in which he has proposed this toast, both on behalf of the Lady Mayoress and myself, but also and more particularly on behalf of the great municipality, of which I have the honour of being the head for this year. Sheffield and Leeds stand in both a healthy and a desirable rivalry with each other, and I earnestly hope that the neck-and-neck race may continue for many years to come. It spells good to both of us, and if one lags hopelessly behind in the race the other lacks incentive to progress. I think we have certain advantages in this respect, that when we think of enlarging our borders, we have not many opportunities of running up against other municipal authorities. The policy which I think Sheffield has endeavoured to adopt is this, to make the privileges of the citizenship of Sheffield such that others have been glad to come in under our rule in spite of the cost of such privileges. I hope you have been impressed, as you have gone round our works, with the fine physique of our workmen: as you have gone round our streets, with the healthiness—I will not say the speckless cleanliness—of the children of the city, and that you will notice that we are enjoying a vastly improved period of good health as compared with past years. The municipality of Sheffield has taken a very progressive part in all educational matters, and I was particularly pleased that the proposer of this toast made special reference to the technical department of our University. We realise that it is work that has been of great value to the city of Sheffield in supplying good material for tramway purposes, and we believe that it will continue to be of such service. Throughout the work of our City Council, I think we can claim that the same quality of efficiency rules as obtains in our tramway department, and no one can make a stronger statement than that. It is not for me, ladies and gentlemen, to add anything more. Short speeches should be the feature of such a gathering as this. Again I would thank you on behalf of the municipality of Sheffield for the exceedingly kind way in which you have received this toast. (Applause)

Mr. J. M. MCELROY (Manchester) proposed the toast of "Our Guests," saying: At half-past three on Tuesday afternoon I returned to this country, having travelled some 12,000 miles—at the Manchester Corporation's expense—and heard something about tramways and passenger transportation in other cities. One of the first documents I got on my return was a communication from our esteemed secretary, instructing me that I should be called upon to propose this important toast this evening. I have been considering the best way I could tackle this task of mine, and I approached several important members of the Association and asked them to give me their valuable advice, but after a time I found myself a little mixed. Our secretary has given me a list of our guests here this evening, and it is a comprehensive one. We have honoured guests in members of the Sheffield Corporation; we have representatives of the Tramways and Light Railways Association, a sister association with whom we have been pleased to work in connection with tramway matters, and tackle our many problems jointly, to the benefit not only of municipalities but also of companies and the tramway industry generally, viz., Mr. Harry England and Mr. Sayers; we have in Messrs. Chattock and Fedden representatives of the Incorporated Electrical Association, also a sister association; we have representatives from the Corrugation Committee, Mr. Worby Beaumont and Mr. Howley. We have representatives of several important steel manufacturing firms in Sheffield; we have the technical Press, we have our esteemed hon. member, Mr. Blain, our immediate past-president; and last, but not least, we have with us the ladies. I have not been able to think out how best in a comprehensive way to express to all these guests of ours our sense of happiness in having them here with us this evening. Last night, after dinner and supping with the Lord Mayor, I went home to bed and dreamed dreams. I thought all those who represented other associations had written papers. Mr. Harry England seemed to be poring over a paper on something about the Tramways Act—"A peep behind the scenes," or "How can a tramway manager become a City Councillor." (Laughter.) Then there was our old friend, Mr. Worby Beaumont, who seemed to be very assiduously engaged on "How the Tramway Bubble has been burst." I see there are members of firms and their representatives here, and last night they all seemed to be engaged in trying to find out how to prevent manganese becoming sweet by becoming honeycombed. (Laughter.) I think there would be an advantage to this Association if we could have some of those papers read at some of our conferences. But I am sure that I am only expressing the views of every member of our Association when I say how glad we are to see them here at these annual gatherings; it is the only opportunity we have of meeting them, and we hope they will come every year. We hope when we meet in 12 months' time in Salford we may have the pleasure again of seeing everyone here, and I will ask you to join with me heartily in drinking the health of "Our Guests" this evening, and I couple with that toast the name of Councillor A. J. Hobson, J.P., and Mr. Harry England, who will perhaps tell us something of the paper he wrote last night. (Applause and laughter.)

Mr. Councillor A. J. HOBSON, J.P. (Deputy Lord Mayor of Sheffield), who was received with applause, in responding said: The pleasure we derive from riding in the people's motor car is great, and the pleasure you seem to derive from coming to Sheffield to talk about it appears to be equally great. We hope your deliberations in this Conference will be useful to the cause, that greater facilities even than those you give already will result from the pains, the care, and intelligence, and the great labour you give to trying to study how best to develop the municipal tramway systems. (Hear, hear.) Probably the first half of last century was marked most by the development of steam power in industry, which did so much to improve the wealth, not merely of England, which first of all took it up, but the whole industrial communities of the world. Probably during the next 50 years now elapsing the great feature of human invention was speeding up, and the rapidly increasing facilities, not merely of personal travel throughout the world, but by communications throughout the world, by the development of railways, steamship lines, bringing raw material and food from all parts of the world to the industrial communities of Europe. That again did much to lift the world into a situation of greater comfort and greater happiness, and in that later movement the tramways have taken a share, of which they are entitled in every way to be proud. The progress that is being made in Sheffield, from the old horse car to the modern electric car, is equivalent to the progress that has been made from the small and slow sailing ship of the old days to the great leviathans that cross our oceans with extraordinary punctuality, notwithstanding the conditions of wind or weather. But somehow there seems to be an atmosphere of very considerable unrest and discomfort. I do not think it can fairly be said that the people as a whole are worse off than they have ever been. It must be remembered that many things have been supplied in the way of free education, free compensation for accidents, free old-age pensions, and a contributory health insurance, which have to be weighed in the balance in estimating wages. These things have to be paid for, and the way they have to be paid for is largely worked out by an inexorable economic law in the greatly increased cost of living. I should be glad if someone could find some new equivalent to those great movements of the last century that would do something to lift the people of the world again on to a higher plane. After all, it is right that man should be a creature of continuously progressive desire, and the wide spread of education has only made those who are educated long for greater leisure, greater opportunities of culture and more pleasure. I believe that the only way that that will have to be done in a satisfactory way is to improve the efficiency and comfort of the race, physically and as a matter of care, or to place it in greater command of the natural resources of the universe. Nothing has more deeply interested me than reading lately the reports of the meetings of the British Association at Birmingham, for we see there that the great chemists and the great physicists of the world begin to dream dreams, that they are on the verge of a great step forward in the scientific control of the resources of the universe. Radium appears to have revised the whole ideas of the scientific world as to what is possible. We have all believed up to now that you could never get out of anything more than you put into it, and that there was no method of increasing force. But we are now told that if we can unlock the extraordinary electric power that is found in the association of the smallest atoms in their mechanical construction that we should have a source of power so great that—the statement was made in the chemistry department of the British Association—there is enough atomic power locked up in one pound of coal to send the Mauretania or the Lusitania across the Atlantic. As it takes about 12,000,000 lb. of coal burnt in the furnaces to do that now, the extraordinary extension of human resources that would come from obtaining power of that nature is at any rate something that would lift the whole life and prosperity of the world into a new era of comfort. I do not know whether the scientific men who are trying to discover the key to the structure of atoms will realise the promise of their dreams, but at any rate in the universities that have been founded in the great industrial centres of the north of England, and spoken of so enthusiastically by my friend from Leeds, is the greatest hope of such discoverers to improve our position in relation to the universe that I know of at the present time. It is not the least satisfactory comment that I can offer with regard to the tramways department af Sheffield, that in addition to the handsome relief they have brought to the rates of the city, they have so nobly contributed to the building of the University of Sheffield, and only at the last meeting a vote of £10,000 spread over 10 years was passed to the science department of the University, which will go largely to increasing the laboratories of the chemical department, and from those laboratories great things may come when they have reached the fulfilment that I hope they will reach. To turn for a moment to lighter matters, I would suggest to tramway managers from other towns that there are perhaps directions indicated in those statistics they have not yet pursued. An enterprising gentleman communicated a letter to our Sheffield papers a short time back, and said that when he got into a tramcar he looked round at the ladies who were in the car, and he counted them up by putting down in one category those whom he wished to kiss, and in another category

Digitized by Google

those whom he would not mind kissing, and a third category those whom he would have to be paid to kiss. (Laughter.) That is a subject of investigation that you might perhaps look into when you get home, because when you publish in your statistics of your cities that there is a large proportion in your own city of ladies in the first category, there would be no occasion to do as Leeds proposes to do, and we do probably, and add other districts to our city, because there would be a natural growth within the city from the attractiveness you would reveal in those statistics. At any rate, perhaps it would be a better subject to examine than the vexed one of women's rights. One little story comes to me in relation to tramcars which may interest you, and that is in reference to a lady of severe and matronly mien, who was sitting in a tramcar when a man got in who frankly ought not to have been admitted by the conductor, because undoubtedly he had been indulging too freely. The gentleman smiled a beery smile as the elderly spinster lady, hugely disgusted, in a minute or two said in her severest tone, "If I was your wife I'd give you poison." The man smiled at her back and said, "If you were, mum, I'd take it." (Laughter and loud applause.)

Mr. H. ENGLAND (Tramways and Light Railways Association): When I was asked to respond to this toast I demurred. Most of you know I am very diffident—(laughter)—so when I demurred my friend the secretary said, "We will put you behind the ex-Lord Mayor of Sheffield, and then you will only have to stand up and say, 'Amen.'" Well, after hearing Councillor Hobson's response to this toast, I think you will entirely agree that the secretary's remarks were quite justified. I cannot sit down to-night without thanking the Municipal Tramways Association for what is almost their embarrassing hospitality. I should like to refer to one thing my friend Mr. McElroy said. I went to bed last night. I wrote a paper; the paper was not a vista of tramways, or tramways *v.* motor 'buses during next year, but I wrote a paper on the Tramways Act, and I got the Tramways Act, the Light Railways Act, provision for motor 'buses, trackless trolley cars, etc., on the brain. I believe Mr. McElroy is a seer. I should be only too glad if I, or some other member of the Conference preferably, would write that paper and read it as soon as possible. The tramway industry wants it, and calls for it. I thank you, ladies and gentlemen, on behalf of the visitors. I wish to thank particularly the President and Secretary of this Association; it is not often we get an opportunity of thanking them. I have been the chairman and vice-chairman of the Tramways and Light Railways Association for the past few years, I know that we have a tremendous amount of work to do each year that people do not recognise. The secretary's work is particulary arduous, and we pass it over and say nothing. We should recognise to-night—I believe Mr. Councillor Barrow, of Birmingham, follows me—what the work has been. The toast list was abbreviated by Mr. Fearnley, who did not want a toast to the Association, which should have appeared, coupled with the name of the President and Secretary, but that will come later, and and I hope you will take any remarks of mine on that subject as coupled with that toast, and that you will receive it right heartily. (Applause.)

Councillor H. BARROW (chairman of the Birmingham Corporation Tramways Committee): Mr. England has already told you the toast I am going to propose to-night. The President ought to have a vote of censure for leaving this toast off the list—it was doubtless due to his very great modesty—but the toast I am proposing includes not only Mr. Fearnley, but Mrs. Fearnley—(applause)—who herself has helped so very largely in the entertainment of the ladies during this Conference. Talking of Councillor Hobson, perhaps we are getting a little bit tired of tramways. It seems to me we are a little bit inclined to ride on one horse. Some of us say there is only one girl in the world for us, and that is tramways. And the question of the girl reminds me of Councillor Hobson's three categories. I have been looking round this room and I should place all the ladies here in Mr. Hobson's first category. (Laughter.) That further reminds me that in the old days I remember we used to have a toast to the ladies at these dinners. I do not know whether Mr. Fearnley is less gallant than most of us, but that toast appears to have been left out on this occasion, but I am sure that we are all delighted to have the ladies with us. In reference to the question of tramways, I am rather in an unfortunate position at Birmingham just at present, because the tramways department there have put a tramway through a residential district, Edgbaston, and the people there are up in arms with regard to this having been done. I have got furious letters from people complaining of the running of these trams past their houses. It is perhaps rather interesting, reverting to the motor 'buses, to note that on this route where motor 'buses were running, we were told that the motor 'buses were carrying everybody who could be carried, and we asked the company to take them off, which they did. We started running our tramcars, we put on twice as many tramcars as there had been 'buses, giving three times the accommodation, reduced the fares from 2½d. to 1½d., and our cars have been crowded ever since, although we have given three times as much accommodation. One other point, Mr. Hobson was talking about improving the conditions in our big cities. I do not want this Association to lose sight of a paper which was read by Mr. Baker some time ago in reference to town planning. We in Birmingham have been endeavouring to carry out some town planning for our various districts. In those plans we have in several cases arranged for wide roads, 80 to 100 ft. in width where possible, and to put the tramways on a separate track with sleepers. We have further passed through the Council and are now intending to apply to Parliament for a length of line where we shall be able to do that at once, if it is passed by Parliament. Now I will return to my toast, that of Mr. Fearnley, Mr. Spencer, and the Association. I am sure those of us who know what the work of the Association is know that it is not all play at these conferences held once a year. During the year a great deal of important work has to be got through. We wish to thank Mr. and Mrs. Fearnley heartily for the way they have arranged the Conference at Sheffield. One does not want to be invidious, but I do not think I have attended any Conference that has been better arranged than the Conference at Sheffield this year. (Hear, hear.) We are extremely indebted to Mr. Fearnley for acting as president on this occasion. In the chair we have found him courteous and firm in his ruling, and he has made an excellent chairman and has also carried out all the arrangements extremely well. Further than that, we know all through the year the Association is hard at work on various tramway matters, and Mr. Spencer, our energetic secretary, is always trying to do something to benefit tramways. I am sure we shall all like to thank them most heartily for the work they have done, and therefore I give you with confidence the toast of Mr. and Mrs. Fearnley and Mr. Spencer, the hon. secretary. (Loud applause.)

The PRESIDENT, who was enthusiasticlly received, replied: I desire at once to thank you for the very hearty way in which you have received this toast, both on behalf of my wife and myself. I am glad to have the opportunity of saying how glad we all are in Sheffield that you have accepted our invitations in such good numbers. Further, it gives me the opportunity of saying what I should have had to say in some other way, and that is to express to the Sheffield Tramways Committee and the Sheffield Corporation our heartfelt thanks for the way in which they have offered hospitality to the delegates and our Association during my year of presidency. I have, too, with deep regret to express to a number of ladies my apologies for the way in which they were detained this evening. I should also like to take this opportunity of expressing to the Lord Mayor and Lady Mayoress our deep thanks, not only for the kind hospitality they have offered to us, but also for the way in which they have given their time and graced our proceedings. This has been very highly appreciated. This annual Conference gives most of us an opportunity for an annual meeting with each other, which except for the Conference we should not enjoy, and even if it was not for the business part of the arrangements, I should say I hope that the Conference will long continue, if only from that point of view. I think we have all tried to do our duty from the business point of view, and I hope you will return home on Friday evening or Saturday, when you leave our city, the better in every way for the 1913 Conference. There is one absent friend from Glasgow, Mr. Dalrymple, who in 1911 gave us such a hearty welcome to that city. We hope he will benefit by his long journey, and that his city will benefit from the information he will pick up at Ottawa, San Francisco, and the other places where there are very important tramway systems, and that next year we shall have the pleasure of again welcoming him at our Conference. As you have heard, we also have with us Mr. Blain, who last year gave us such a royal and hearty welcome to West Ham, I am glad to think he is again able to be with us as our guest. I can only now say that your presence here in such numbers has amply recompensed us for any little effort that we have made. If I may say so, what has been to me the most striking and the most satisfactory feature of the Conference, has been to view from the presidential chair the way the members have stuck to the business portion of the meetings all the time they have been in the city. I am sorry that my chairman, Sir William Clegg, is not here personally to add a word of welcome. I know he will return to Sheffield with a good many ideas as to how Continental tramways are run, and in time, at any rate, somebody will have to boost up. I again thank you for the hearty manner in which you have received this toast, and I trust we shall have continued success for the remaining portion of our time. (Loud applause.)

Mr. C. J. SPENCER (general manager, Bradford Tramways, and hon. secretary and treasurer of the Association), who was also received with acclamation, said: I am rejoiced that we have an opportunity, though somewhat unsought, of thanking you all here for your attendance. This has been a very gratifying Conference. I should like to express on my own behalf my gratitude to the Sheffield Corporation and to the President for the very kindly and great hospitality on this occasion. So far as my efforts are concerned, I can only say the whole credit for these arrangements is due to your President and his committee. As secretary, it has been a very great pleasure indeed to work 12 months with an old friend and an old colleague. I am not surprised that with Mr. Fearnley as your president you have had, perhaps, one of the most profitable and successful years in the Association's history. What I have been able to do has been very little, but I am very glad to think that that little has been appreciated. (Applause.)

This concluded the toast list and the company separated after singing the National Anthem

Digitized by Google

**FRIDAY, SEPTEMBER 26.**

## ANNUAL MEETING.

The twelfth annual meeting of the members of the Municipal Tramways Association (Incorporated) was held on Friday, September 26, 1913, at the Royal Victoria Station Hotel, Sheffield. The retiring president, Mr. A. R. Fearnley, took the chair, and was supported by Messrs. A. Baker, J. B. Hamilton, J. M. McElroy, C. J. Spencer, J. Aldworth (past presidents), and by Messrs. W. Clough, P. Fisher, T. B. Goodyer, H. Mozley, Councillors J. H. Rogers and C. F. Spencer, and Aldermen J. Miles and S. Flint, a large attendance of members being present.

The PRESIDENT: The first item is the minutes of the last annual meeting; we usually take these as read. They have been printed in the proceedings, of which every member has had a copy.

The minutes were then taken as read and confirmed.

The PRESIDENT: The next business is the president's remarks. I am glad to see you all looking so well this morning, though some members of the Executive do not feel so well as they look. (Laughter.) The next item is the report of the Executive Council. Copies have been sent to each member of the Association. Will someone move that the report of the Executive Council be received and adopted, and we will then proceed to any discussion, if necessary?

Mr. H. MOZLEY (Burnley): Are we allowed to say anything on the items in the report?

The PRESIDENT: Yes.

Mr. MOZLEY then moved that the report of the Council be received and adopted.

Councillor J. H. RODGERS (Newcastle): I second that motion.

Mr. MOZLEY: Among the items referred to in the report is the width of vehicles used in the public highway. Most of you know there is no limit. On page six of the report there is a reference to the width of vehicles, and this is a matter which troubles us a great deal in Burnley. Under the Motor Car Order Act referred to, there is, in fact, no limit to the width of the load. The width of the vehicle is limited to 7 ft. 4 in. or 7 ft. 6 in., but there is no limit to the width of the load. We have motor cars with loads 10 ft. 6 in. wide, and we have also 9 ft. 6 in. with the overhang of the car, reducing that to 8 ft. 3 in. We have had several accidents in Burnley, and something ought to be done. The Executive Council have considered the matter and have been to the Local Government Board, but nobody seems able to get anything done. I wish to ask you to go into the matter in your own districts and see if something can be done. The town clerk of Burnley is going to take the matter up, but I think we ought to have the assistance of every other tramway undertaker.

The PRESIDENT: We shall be pleased to hear anyone on any item of this annual report. There are a good many matters dealt with, and allusion may be made to any subject referred to. If there are no comments, I must put the motion to the meeting.

The annual report of the Executive Council was then received and adopted.

[The Executive Council's report is given on a later page.]

The PRESIDENT: The treasurer's report and statement is included in the annual report.

On the motion of Mr. W. CLOUGH (Bury), seconded by Mr. T. B. GOODYER (Croydon), the treasurer's report and statement of accounts were received and adopted.

### APPOINTMENT OF OFFICERS.

#### Alderman H. Linsley Elected President.

The PRESIDENT: The first position we have to fill is that of President of our Association. It is an honour usually allowed to the retiring President to be able to nominate his successor, and with your permission I should very much like to submit the name of Mr. Alderman H. Linsley, of Salford. (Applause.) Mr. Alderman Linsley has had a longer experience of our Executive Council work than any other Council member that we have with us. He has been a member of our Council for seven years; further than that, he has been chairman of the Salford Tramways Committee since its inception some 12 years ago; he has assisted us assiduously in the discharge of his duties as a member of the Tramways Association, and he is a gentleman well known, I believe, to have the respect of every member of this Congress. I therefore, without further words, have much pleasure in submitting the name of Mr. Alderman Linsley in nomination for the position of President of the Municipal Tramways Association (Incorporated) for the ensuing twelve months, and I will ask Alderman Miles, of Bolton, kindly to second the motion. (Applause.)

Alderman J. MILES (Bolton): I feel greatly the honour of being allowed to second the nomination of Alderman Linsley. I thoroughly agree with what your President has said with regard to his qualifications. There is another qualification in addition to those mentioned, and that is that he comes from a royal borough, and we know that the members of that Corporation will endeavour as far as in them lies, to do justice to and make our Conference when it is held in Salford, as I presume it will be, a thorough success. I dare say you will all feel that it would be impossible to imitate the example of Sheffield. Well, I know the Salford people will do their best at any rate not to come behind Sheffield, and whether that be so or not, the question that really appertains to us is the capability and qualification of the gentleman who is to occupy this position. With regard to Alderman Linsley, there cannot be anything but high praise as to the interest he takes in his own tramway undertaking; and in tramway undertakings generally, and the capacity he is able to bring to bear on this particular office. He is a gentleman of exceedingly courteous manner, and I know that every member will receive at his hands during his year of office, a kindly welcome, a good handshake, and that they will feel that they have in him a president in whom they can have perfect trust. I have the greatest pleasure in seconding the resolution. (Applause.)

The resolution was then put, and Alderman H. Linsley, of Salford, was unanimously elected President of the Association for the ensuing year.

Alderman LINSLEY: Mr. President, Mr. Alderman Miles, and gentlemen,—It is to me a very great honour for an Association of this size to confer on me the highest position it is in their power to give.

Alderman H. Linsley.

I feel some little diffidence in the matter myself, because I have got such excellent men to follow, and if it had not been for the gentlemen who have occupied the presidential chair in the past promising to give me all the assistance they possibly can, I should not have accepted this position as readily as I have done this morning. But I think with that offer of assistance, and with the assistance of our excellent secretary, Mr. Spencer, upon whom I am going to rely very largely —I shall draw upon him on all occasions—if I have good health I shall be able to get through the year very well. At any rate I will do my best. And with regard to what Alderman Miles has said about Salford entertaining you, I am not going to say we shall go one better than Sheffield, for that would be a difficult thing to do, but I am going to come as near as I possibly can to Sheffield. We have had one short visit from this Association, and what we did on that occasion I think gave satisfaction, and if we do nothing worse than that I think we shall all be satisfied. I thank you very much for the unanimous way in which you have elected me to the chair of this Association. (Applause.)

#### Election of Mr. Peter Fisher as Vice-President.

Mr. H. MOZLEY (Burnley): I rise with very great pleasure to submit to you the name of a very old personal friend for the position of vice-president of this great Association, Mr. Peter Fisher, of Dundee. (Hear, hear.) I have known him as long as any manager in this room,

Digitized by Google

and what is more, he has an intimate connection with Burnley and district, for I think he built most of our permanent way before I reached the town, which he used to visit now and again, so I think my earliest recollections of tramway work are connected with Mr. Peter Fisher, of Dundee. We have other bonds of sympathy. He was a company's manager in charge of a steam tramway system; he was ultimately sold up like myself and handed over to the tender mercies of a municipal authority. I do not think that either of us has suffered in consequence of the change. It affords me peculiar pleasure to submit his name to you as the vice-president for the ensuing year. I ought to say that it is a very natural ambition for the manager of a smaller undertaking that he should attain to this great honour, and I amongst others have looked forward to the position of president. I hope some day that some scheme will be devised by the wisdom of our Executive Council—we have plenty of wisdom amongst us, although you may not know it -(laughter)—which will enable the managers and chairmen of committees of the smaller undertakings to become the President of this Association, and to extend the usefulness of this Association by getting the minds and ideas of the men who are working undertakings of less magnitude than those of the great cities we have hitherto visited. I believe the nomination I have to submit to you will not meet with any opposition or competition, and that it will be unanimously and heartily supported. (Applause.)

Mr. J. B. HAMILTON (Leeds): I rise for the formal purpose of seconding the proposition made by Mr. Mozley. To those of us who are on the Executive Council, it has always been a matter of serious

**Mr. Peter Fisher.**

consideration as to who should occupy the chair, because we recognise that in our Association we have a means of utilising and focussing the work we are all engaged in, which must devolve upon and be influenced a great deal by the work of the President. I think that in the President-elect, your President who has just been duly appointed, we have been exceedingly fortunate. In deciding who should follow him we have had some consideration, and that has been completed in the direction of asking Mr. Fisher to take this post and submit his name to you. I merely refer to that side of it, because I hope you will all recognise in Mr. Mozley's proposition there is a good deal of personal sacrifice on his part, and we all appreciate that, I am sure. I may say, however, that Mr. Fisher's name as the possible occupant of the presidential chair in due course has always been before the Council; his long service in the cause of tramways, an original member of the Executive Council of this Association, of which he has been a member so long, fitted him for the work, and had it not been for that inherent diffidence which is characteristic of his country—(laughter)—I am not sure he might not now have been occupying the ornamental position which some of us occupy as being past-presidents. However, I hope, without making Mr. Fisher blush—he can blush I can assure you—by endeavouring to point out all the many qualities which he possesses, that you will support the nomination which has been made. There is only one point I have to caution you upon. Mr. Fisher says the centre of gravity is near Bradford and in visiting, as we may in due course, Dundee, we shall be a long way from the centre of gravity. Looking at the festive manner in which several members of the Association have been conducting themselves in the past few days whilst enjoying the hospitality of Sheffield, I tremble to think of what will occur when we get so far away from the centre of gravity. But I suppose we must let the future take care of itself, and I think we may safely say under Mr. Fisher's presidency that we shall not go very far wrong. I therefore beg to second the nomination.

The motion that Mr. Peter Fisher, of Dundee, be elected vice-president of the Association for the ensuing year was then unanimously agreed to.

Mr. PETER FISHER: I need not tell you that I appreciate very highly the great honour that this Association has conferred upon me this morning, and I do not want to say any more at this moment than just that I will do everything I can to perform the duties that attach to the office in the best way I possibly can. (Applause.)

Councillor G. A. JOHNSTON (chairman, Dundee Corporation Tramways Committee): Perhaps you will allow me as chairman of the Dundee Tramways Committee to congratulate our manager upon the high honour you have conferred upon him this morning. Like yourself, Mr. President, and other members of this Association, I know that his experience and his abilities are very much appreciated here. Not only are they appreciated here, but I am bound to say they are equally appreciated at home. We know Mr. Fisher to be one of the ablest managers in Great Britain, and what he does not know about tramways is not worth knowing I say we all recognise that, and we appreciate indeed the honour conferred on Mr. Fisher, and we appreciate more the honour that has likewise been conferred on Dundee, and have no doubt he will come up to the standard of past vice-presidents and presidents as well. (Applause.)

Councillor W. H. BUIST (deputy-chairman, Dundee Tramways Committee): May I be allowed also to associate myself with the remarks which have fallen from Councillor Johnston. We in Dundee must congratulate the Association upon getting a vice-president from Dundee. Those who know Mr. Fisher and who know his work appreciate that work. I can hardly understand, however, what Mr. Hamilton meant when he spoke of Mr. Fisher's natural diffidence, because everyone knows that Mr. Fisher is one of the most pushful and boastful men you can come across. In our city he is known as Pioneer Peter. I do not know what he will have up his sleeve for the Association if in due course it does him the honour to elect him president of the Association; but if that time comes, and you pay the city of Dundee a visit, I am quite certain of this, that you will find something new has been devised by one of the pioneers of tramway undertakings. (Applause.)

The PRESIDENT: It will be a very appropriate change from "Pioneer Peter" to President Peter. (Hear, hear, and laughter.)

### The Executive Council.

The meeting then proceeded to elect by ballot members to fill the vacancies on the Executive Council. The retiring members were Councillor Rodgers, Council representative, and Messrs. Aldworth, Goodyer and Hamilton, managerial representatives, there being an additional vacancy in the last class by the election of Mr. Fisher as vice-president.

Councillor Rodgers was returned unopposed as the Council representative.

Alderman H. W. LITTLER (West Ham): Should I be in order in moving that the three retiring members be re-elected?

The PRESIDENT: No, they have to be nominated, and voted on by ballot. That is according to the articles of association.

The following nominations were then made: Messrs. G. W. Holford (Salford), J. B. Hamilton (Leeds), J. Aldworth (Nottingham), T. B. Goodyer (Croydon), A. L. C. Fell (London), W. J. McCombe (Hull).

Mr. J. ALDWORTH: May I ask that my nomination be withdrawn? I have been a member of the Executive since the commencement, and I feel that I should be studying the interests of the Association by retiring, so that one of the newer members can come in, and give you the benefit of his experience and ideas.

Mr. HAMILTON: I desire to move the nomination of Mr. Fell, and I would remind you that a year ago when Mr. Fell was appointed a member of the Executive Council he desired to be allowed to withdraw, and let fresh blood come in. I think we should probably be consulting his own feelings if he was allowed to remain out, but some of you may remember we have a programme before this Executive Council and the Association which involves a very large sum—the question of road maintenance and taxation. I do think that is one of the biggest works we as an Association have ever attempted, and I hope we shall be able to carry it to a successful solution. But if it is going to be successful, I think very distinctly we ought to have a member who is a representative of that great body, the London County Council, with us on the Executive. I especially urge Mr. Fell's appointment for that reason, and I hope it will be carried.

Mr. A. BAKER (Birmingham): I should like to have the pleasure of nominating Mr. McCombe, of Hull. He has been a member of the Association for a number of years, and I think we all remember with

Digitized by Google

very great pleasure the delightful paper he gave us at the West Ham Conference. A good deal has been said about the smaller towns being represented on the Executive Committee or Council, not that I wish to call anything small in connection with Hull, but I do think the Association would be doing a wise thing to send a representative from Hull to help the members on the Executive Council. I have therefore great pleasure in nominating Mr. McCombe.

This was formally seconded.

The PRESIDENT: I do not know whether you will accept Mr. Aldworth's withdrawal. There is nothing in the articles to say a man's consent is necessary. (Laughter.) Do you really wish to withdraw, Mr. Aldworth?

Mr. ALDWORTH: I think I do, Mr. President.

The PRESIDENT: I wish to consult Mr. Aldworth's wishes. He mentioned this matter twice to me before, but I persuaded him not to retire.

Mr. ALDWORTH: It is only because I feel new blood is wanted on the committee. It is quite personal, and I leave myself entirely in your hands.

The PRESIDENT: Under the circumstances, then, we will allow Mr. Aldworth to withdraw his nomination. We shall probably be able to get him back with us shortly.

A MEMBER: I wish to ask if we could not co-opt Mr. Holford; it would not be the first time a manager has been co-opted.

The PRESIDENT: That is not provided for in the articles of association. We must allow this nomination to stand, and I think, if I may take the liberty of saying so, there is no reason to think that it will not be supported, because it is very desirable that the President should have the assistance of his manager.

Alderman Brodie, J.P. (Blackpool) and Alderman Bowes (Manchester) were appointed by the President as scrutineers of the voting papers.

Later, it was announced that the ballot had resulted in the election of Messrs. Holford, Hamilton, Goodyer, and Fell. The members of the Executive Council for the ensuing year are thus as follows:

EXECUTIVE COUNCIL, 1913-1914.

*President:*

Alderman H. Linsley, Salford.

*Vice-President:*

Peter Fisher, Dundee.

*Past-Presidents:*

J. Dalrymple, Glasgow; C. J. Spencer, Bradford; A. R. Fearnley, Sheffield.

*Council:*

| | | | |
|---|---|---|---|
| A. Baker .. .. | Birmingham. | J. B. Hamilton .. | Leeds. |
| Ald. Sir W. Clegg | Sheffield. | G. W. Holford .. | Salford. |
| W. Clough .. .. | Bury | J. M. McElroy .. | Manchester. |
| A. L. C. Fell .. | London. | Ald. J. Miles .. | Bolton. |
| Ald. S. Flint .. | Leicester. | H. Mozley .. .. | Burnley. |
| T. B. Goodyer .. | Croydon. | Coun. J. H. Rodgers | Newcastle |

Coun. C. F. Spencer Halifax.

*Hon. Solicitors:*

E. R. Pickmere, town clerk, Liverpool.
Sidney F. James, town clerk, Ilkeston.

*Hon. Secretary and Treasurer:*

C. J. Spencer, Bradford.

On the appointment of honorary solicitors,

The PRESIDENT: Owing to the large number of occasions on which we had to consult our honorary solicitor, Mr. Pickmere, the Executive provisionally added the name of Mr. Sidney James, of Ilkeston. This year we should like to recommend the appointment of both those gentlemen as honorary solicitors. They are both useful members, and we make constant demands upon their services, and they always respond in a most generous way.

I beg to move that Mr. E. R. Pickmere, town clerk of Liverpool, and Mr. Sidney F. James, town clerk of Ilkeston, be appointed honorary solicitors for the ensuing 12 months.

The resolution was unanimously adopted.

The PRESIDENT: We have next to elect an honorary auditor. The duties of that office are very important and they have been very adequately performed by our friend Mr. Holford in previous years. I think possibly in view of my expression of opinion that Mr. Holford will receive your support for the Executive Council, I may take it for granted that he has received your support and that you have carried out your promises, and therefore I am going to suggest that our friend Mr. Mozley, be asked to take up the position of hon. auditor.

A MEMBER: Is it in order for a member of Executive to be hon. auditor? (No, no.)

Mr. W. CLOUGH (Bury): It is not desirable.

A MEMBER: I move Mr. C. Furness, of Blackpool.

Mr. FURNESS: I desire that my name should be withdrawn. I think it is desirable to have a man outside the Association.

Mr. J. B. HAMILTON: I think the appointment of auditor might very well stand over until after the election of members of the committee. There are five names and four only can be appointed, and if it is my fate not to be one of the four I should esteem it a very great honour to be appointed auditor. (Laughter.) I recognise the spirit of the remark from the gentleman from Blackpool, but I think a member who has spent the money should be the auditor. As I have been on the committee, on the principle that an old mason makes a good labourer, I think you ought to appoint me as auditor.

Bailie ALSTON (Glasgow): I beg leave to submit a name which I think would meet with the approval of all here, the name of one of the past-presidents, who is now out of office, one who has no office at all just now, and one who is an accountant by profession. I submit the name of Mr. J. Dalrymple, of Glasgow.

The PRESIDENT: I am glad to say that Mr. Dalrymple is still a member of the Executive Council, and we should not like to lose his services upon it.

Mr. W. J. McCombe, manager, Hull Corporation Tramways, was unanimously elected hon. auditor.

The PRESIDENT: The secretary reminds me that I have omitted the election of secretary and treasurer.

Alderman LINSLEY: If I may have the privilege, I should be very pleased to move that our friend Mr. C. J. Spencer be nominated for the position again. As I said a few minutes ago, I rely very much on Mr. Spencer being re-elected so as to be able to give me the very valuable assistance he has given to past presidents, and therefore I move that Mr. C. J. Spencer be elected hon. secretary and treasurer.

Alderman J. MILES (Bolton): May I have the pleasure of seconding that, and of expressing the feelings of every member of the Association, that we could not have a gentleman who would perform the duties in a more satisfactory, a more kindly, and a more genial manner than Mr. Spencer does. Personally I should regret very deeply indeed to see Mr. Spencer out of that position, and I do not think there is a gentleman in the whole Association better capable of performing those duties than Mr. Spencer. I hope we shall show that this morning by a unanimous vote, and one carried with acclamation. (Applause.)

The motion that Mr. C. J. Spencer be re-elected hon. secretary and treasurer was unanimously and heartily agreed to.

Mr. C. J. SPENCER (Bradford), who was received with renewed applause: I shall be very pleased indeed to undertake the duties and responsibilities of this office for another 12 months, if you think my past history is sufficiently good.

Dr. A. W. CHAPMAN (Manchester): I have the pleasure to move on your behalf the following vote of thanks:

> "That the best thanks of the Municipal Tramways Association be given to the Sheffield Corporation, to the Lord Mayor, and the chairman and members of the Tramways Committee for the accommodation provided for the meeting of the Conference, for the generous manner in which the members and delegates have been entertained, and for the hospitality extended to them; also to the president, Mr. Fearnley, and the officers of the Tramways Department of the Corporation for their efforts in making the Conference so enjoyable and so successful."

That resolution is so comprehensive that it really saves me making any speech on the matter, besides time is limited, but I would just like to point out that there are two omissions. The Lady Mayoress, I think, should be included by name, and also on behalf of all our ladies who have accompanied us to this Conference, I would desire to express how much they have appreciated all the efforts that have been made to entertain them, and how thoroughly they have enjoyed themselves.

Alderman H. LINSLEY: I have very great pleasure in seconding this resolution.

The motion was carried with acclamation.

The PRESIDENT: That matter I will convey to my Tramways Committee and Corporation, and thank you very much for the hearty way in which you received it. I would also say we thank the Rotherham and Bradford Corporations for sending over their trackless trolley vehicles, which were quite an education. They were sent over at considerable trouble, and we appreciate their efforts very much. I also want to acknowledge the assistance I have received from Mr. Spencer, Mr. Falkingham, Mr. Watson, and Mr Oates and their assistants, without whom I do not know where we should have been. (Applause.)

Councillor H. HEATHER (Leyton): I wish to propose a vote of thanks to the President and Secretary for the work they have done during the year. I think the members of the Association ought to honour those who do the work for us. Nobody knows but those who have occupied a similar position the amount of work imposed by office, and they do it as a labour of love. (Hear, hear.)

The motion was carried *nem. con.* and was formally acknowledged by the President.

The proceedings then concluded.

### REPORT OF THE EXECUTIVE COUNCIL.

The following is the report (slightly abbreviated) of the Executive Council which was adopted by the annual meeting of the Association as reported above.

The Executive Council beg to submit the following report on the work for the past year:

NEW MEMBERS.—Since the last Annual Conference the following local authorities have joined the Association: Belfast, Coventry, Walthamstow.

The following gentlemen have been admitted as members of the Association:

J. Barnard, general manager, Corporation Tramways, Bolton.
L. C. F. Bellamy, borough electrical engineer and manager, Corporation Tramways, Ilkeston.
G. F. Craven, general manager and engineer, Corporation Tramways, Reading.
F. J. S. Hosken, general manager, Corporation Tramways, Darwen.
Wm. Murray, tramways manager, Corporation Tramways, Walthamstow.
H. Pilling, general manager and engineer, Corporation Tramways, Accrington.
W. T. Robson, general manager and engineer, Corporation Tramways, South Shields.
H. H. Saunders, general manager, Corporation Tramways, Lowestoft.
Geo. Webster, general manager, Corporation Tramways, Rochdale.

RESIGNATIONS.—The following have resigned their membership during the year:

W. Binns, engineer and manager, Corporation Tramways, Reading.
H. E. Blain, tramways manager, Corporation Tramways, West Ham.
A. A. Day, general manager, Corporation Tramways, Bolton.
J. H. Ellison, traffic superintendent, Corporation Tramways, Darwen.
C. Mittelhausen, general manager, Urban District Council Tramways, Bexley Heath.

The Council regret to have to state that death is responsible for the loss of one member during the year, viz., Mr. J. H. Ellison, traffic superintendent, Corporation Tramways, Darwen.

VACANCIES ON EXECUTIVE COUNCIL.—The Council also regret to report the loss on the Executive Council of the immediate past-president, Mr. H. E. Blain, West Ham, who has taken up a position outside municipal service, and also of Bailie W. F. Russell, who has resigned his position as chairman of the Glasgow Corporation Tramways Committee. Mr. Councillor C. F. Spencer, chairman of the Halifax Corporation Tramways Committee, has been appointed a member of the Council in succession to Bailie W. F. Russell.

TELEGRAPH AND TELEPHONE WIRES CROSSING TRAMWAY TROLLEY WIRES.—The question of guarding telephone wires belonging to the Post Office has become an important matter for the consideration of tramway undertakings, due to the Government having acquired the business of the National Telephone Company, and with a view of some arrangement being arrived at with the Post Office as to the cost of protection of these wires, the Executive Council, along with representatives of the Tramways and Light Railways Association, obtained an interview with the Postmaster-General in October, 1912, and accompanied by Sir Geo. Scott Robertson, M.P., Sir Wm. Byles, M.P., A. H. Gill, Esq., M.P., attended at the General Post Office for this purpose and interviewed the Postmaster-General. The President (Mr. A. R. Fearnley) dealt at length with the position so far as tramway undertakings were concerned. The Postmaster-General took up the position that the settlement made in 1905, whereby he agreed to pay half when he was second comer, could not be departed from. He pointed out that the National Telephone Company were not a statutory body, and were in a different position from the Post Office. The National Telephone Company were in such a position that they had to accept whatever the Corporations required them to do. He, however, agreed "that where the wires are few in number, up to three circuits—six wires they will be insulated, without prejudice to any further action that may be taken with regard to putting wires underground. The actual cost of the cable itself, or rather the difference in the cost of putting the wires into a cable instead of leaving them bare, would be borne by the tramway authority." The Postmaster-General promised to go into the whole matter, and put forward a general scheme for acceptance in due course. On February 13, 1913, the Post Office put forward in writing the following offer:

"General Post Office,
"London,
"*13th Feb., 1913.*

"With reference to the deputation representing the Municipal Tramways Association which waited upon the Postmaster-General on the 25th of October last, I am directed to inform you that the Post Office engineers have given very careful consideration to the possibility of adopting some method of protecting the telegraphs from tramway power circuits, which, while not less effective than guard wires, shall not be open to the objection referred to by the representatives of the Association.

"As the Association is aware, the erection of aerial cable is impracticable in many cases, and it is always more or less unsatisfactory from an engineering point of view, as well as being expensive, while the construction of underground work at the Post Office expense where the telegraphs were in dangerous proximity to trolley power circuits, as was explained to the deputation, could not be fiancially justified. There is, however, now available an insulating material which will admit of the insulation of each wire crossing a power circuit at a comparatively low cost. While in some ways this method of protection may not prove so satisfactory from the Post Office point of view as the provision of guard wires, the Postmaster-General is prepared to adopt it on certain conditions in view of the representation of undertakers that guard wires interfere with the efficient working of their tramway systems. On the new system the cost of insulating a span of one circuit of two wires will be about 11s. 6d., but the Association will readily appreciate the advantage of avoiding continual applications to undertakers for the cost of insulating such circuits added to a crossing. The average number of wires in a bed crossing a tramway route may be taken as 16, and I am to suggest, therefore, that when a tramway undertaker desires to avoid the erection of guard wires, he should pay a first and final charge for each Post Office crossing (*i.e.*, any arrangement of wires under which all wires are terminated on one side at least on the same support) of £4 10s. 0d. when the Post Office is first comer, and £2 5s. 0d. when it is second comer."

"Of course, when the Postmaster-General is first comer a further initial charge would in each case be made to cover the cost of taking down and re-erecting the circuits already in existence.

"The proposal to use insulated wire cannot for the present apply to trunk wires and wires running parallel to power circuits for considerable distances. Such works, however, are only concerned in a very small number of cases, and cannot materially affect the main question.

"The Postmaster-General cannot admit that the obligation of the undertakers to bear the cost of protection is affected by the fact that the Post Office wires may be erected subsequently to the construction of the tramway.

"As was pointed out to the deputation, Parliament in the interests of the public has conferred upon the Postmaster-General a right to erect and maintain telegraphs upon and over public roads which is prior and superior to the right of any undertaker acting under statutory powers.

"This right is recognised by the insertion in all Tramway Acts and Orders of a clause providing that undertakers shall comply with such reasonable requirements as the Postmaster-General may make from time to time for the protection of his telegraphs. At the conference held at the Board of Trade in 1905 the Post Office contention that the cost of providing protection for the telegraphs should be borne by the undertakers even when the Post Office was second comer was admitted to be reasonable, and it was only as an act of grace that the Post Office agreed to bear one half the cost.

"In view of representations from various bodies that the new methods should be introduced as soon as possible the Postmaster-General will be glad to learn at the earliest convenient date that the proposals are regarded as satisfactory."

This offer was considered by the Executive Council in due course, and it was decided to endeavour to obtain a further interview with the Postmaster-General with a view of getting some modification of the terms. Accordingly a small deputation consisting of the President (Mr. A. R. Fearnley), Vice-President (Mr. Ald. H. Linsley), and Mr. Ald. J. Miles, Bolton, along with Mr. Stephen Sellon, Mr. Harry England, Mr. C. H. Dade, and Mr. A. de Turckheim, representing the Tramways and Light Railways Association, waited upon the Postmaster-General on April 15, 1913, but were unable to get him to deviate from his original position as regards the principle. It was then pointed out that in many country districts the number of wires in a crossing would not average 16, but would probably consist of only three or four wires, and the Postmaster-General agreed that the charge for protection should be varied to 5/9 per circuit in second comer cases, and 11/6 in first comer cases, an annual account to be rendered to the various undertakers for the work actually done over their lines. The result of this further interview was eventually reported to the Executive Council, and they decided that the final acceptance, or otherwise, of the offer was a matter for the whole Association, and accordingly an extraordinary general meeting was held in London on June 18, 1913, when the matter was fully discussed by a representative body of members, and after considerable deliberation the following resolution was passed:

"That this extraordinary general meeting of the Municipal Tramways Association held on June 18, 1913, having heard the report of the Executive Council on the negotiations with the Postmaster-General regarding telegraph and telephone wires crossing tramway wires, recommends the municipalities to accept the offer of the Postmaster-General contained in a letter from the Post Office

Digitized by Google

dated February 13, 1913, and amended at a conference which a special deputation had with the Postmaster-General on April 15 last, as being the best terms obtainable from the Post Office.

"This meeting at the same time desires to record its keen disappointment that the Postmaster-General has not seen his way to reconsider the principle of this matter, seeing the change which has taken place by the taking over of the National Telephone Company's system by the Post Office, which circumstance has, in the opinion of this meeting, entirely altered the condition of things obtaining at the time of the agreement arrived at in 1905."

This resolution was duly conveyed to the Postmaster-General on his being notified of the acceptance of the offer.

WIDTH OF VEHICLES USING THE PUBLIC HIGHWAY.—On account of the remarkable growth of heavy motor traffic, further negotiations have taken place with the Association of Municipal Corporations and the Local Government Board with a view to the promotion of some legislation to remove the disability in regard to the width of vehicles that use the public highway, but particularly as to the width of their loads.

The Association of Municipal Corporations, who recently had a sub-committee considering the amendment of the Motor Car Acts and Orders, pointed out that they were not prepared to make any recommendations with regard to the width of vehicles, but as regards the width of loads, suggested that a by-law might be made, with the sanction of the Home Office, under Section 23 of the Municipal Corporations Act, 1882, provided, of course, that a good case was made out. The Local Government Board stated that they were not in a position to give any information as to the prospect of legislation respecting the use of vehicles on roads.

LIGHT RAILWAYS BILL—TRACKLESS TROLLEY VEHICLES.—As stated in our last report, the Board of Trade promoted in the 1912 session, a bill entitled "The Light Railways Bill," in which they sought to amend the Light Railway Act, 1896, to include trackless trolley vehicles, and thus enable local authorities to obtain powers through the Light Railway Commissioners to equip routes for this system of traction. At a special emergency meeting of the Association held in London it was decided, in view of the objectionable road maintenance clauses tabled by a Standing Committee, that steps be taken to have the clauses deleted, or amended. All reference to trackless trolley vehicles was eventually deleted from the bill prior to its coming before the House of Lords, and although an attempt was made to have the section reinserted when before the Lords it was defeated.

EXPENSES OF URBAN DISTRICT COUNCIL OFFICIALS ATTENDING CONFERENCES.—The difficulty experienced by a number of representatives of Urban District Councils, by reason of the attitude of the Local Government Board in not allowing the expenses of delegates attending conferences of this Association, has had further consideration, and negotiations have taken place with the Local Government Board with a view of getting the obstacle removed, but the Executive Council are informed that the Board is unable to deviate from its usual course. The Council felt, however, that further steps should be taken, and accordingly entered into communication with Mr. A. J. Lees, secretary of the Urban District Council's Association. Mr. Lees pointed out that various attempts had been made to get the Local Government Board to pass an amendment to the Public Health Act, 1885, but this had not been attended with any success. The Executive Council therefore regret to report that they are unable to obtain the reform desired at present.

STANDARDISATION OF RAILS, TYRES, AXLES, AND SPRINGS.—At the request of the Engineering Standards Committee, the President (Mr. A. R. Fearnley) was nominated and appointed as the representative of this Association on the Sub-Committee on Tramway Tyres, Axles, and Springs. Mr. A. L. C. Fell (London) was appointed representative of the Association to attend a conference which would have under consideration the method to be adopted to determine the electrical conductivity of conductor rails which would be acceptable to both user and manufacturer, and their report on the matter is being prepared. As mentioned in the last report, the Association have increased their representation on the Engineering Standards Sub-Committee on Tramway Rails, which now comprises Mr. J. B. Hamilton, Mr. J. M. McElroy, and the Secretary (Mr. C. J. Spencer). It is hoped that as a result of the increased representation of tramway operators on these bodies some increased benefits may be obtained.

BOARD OF TRADE REGULATIONS—GAS LAMP BRACKETS.—The Executive Council have had under consideration certain draft regulations of the Board of Trade relating to the earthing of guard wires by means of insulating cable, in place of bonding the pole to the rails, and also as to triple insulation being used between the trolley wire and poles carrying gas lamp brackets. The views of a number of operators were obtained and submitted to the Board of Trade, and they eventually decided to leave the regulation as to guard wires as it stands, and simply adopt triple insulation as an alternative in the case of poles carrying gas lamps, in accordance with the recommendation of the Council.

INCOME TAX—ALLOWANCES FOR DEPRECIATION (PERMANENT WAY).—The interpretation of the agreement entered into by this Association, the Institute of Municipal Treasurers and Accountants, and the Board of Inland Revenue in 1909, relative to depreciation allowances for income tax purposes, has been the subject of negotiation by your Council with the Superintending Inspector of Taxes (Board of Inland Revenue) and the Secretary to the Institute of Municipal Treasurers and Accountants. Mr. J. M. McElroy, general manager, Manchester Corporation Tramways, who first took the matter up with regard to his own system, contended that the allowance for ordinary repairs per mile, as well as the allowance for cost of renewal per mile, should be multiplied by the number of miles of tramways in use during the year of assessment. The Board of Inland Revenue, however, claimed that the allowance for repairs should be the actual average expenditure for the three years prior to the quinquennial period, nothwithstanding the fact that many additional miles of track might have been added to the system. The Secretary of the Institute of Municipal Treasurers and Accountants, in correspondence with Mr. J. M. McElroy, concurred with the view of the Superintending Inspector of Taxes. Later, however, the Board of Inland Revenue agreed that some alteration was necessary, and submitted the following clauses in substitution of paragraph 5 of the scheme, which were accepted by the Executive Council:

"The amount to be added in respect of ordinary repairs should be determined by taking the actual average expenditure as shown in the accounts of the undertaking for the last three years, *i.e.*, the three years preceding the initiation of the scheme, or such period less than three years as the undertaking has been in existence. If at the beginning of any year of assessment for which the allowance is being computed, the mileage of the track differs from the average mileage during the three years above mentioned, the allowance under this head should be increased or diminished proportionately."

The following sentence to be added to paragraph 7:

"The whole amount to be allowed for repairs in each year of the quinquennium can be varied only with variations in the mileage of the track, *i.e.*, the amount to be allowed per mile of track is a constant quantity."

RAIL CORRUGATION.—The Rail Corrugation Committee are pursuing their investigations, but are not prepared to submit a further report as yet. The committee decided not to retain the services of a consultant in connection with this matter at present. In accordance with a resolution passed at the managers' meeting at Sunderland, the committee are concentrating their investigations on the question of vibration of both rails and rolling stock. Special attention is also being given to the question of the application of microphotography in the investigation of the physical structure of metals.

MEETING OF MANAGERS' SECTION, SUNDERLAND.—Meetings of the Managers' Section were held in the Council Chamber, Town Hall, Sunderland, on Thursday and Friday, June 5 and 6, 1913, when about 40 members attended. The following papers were submitted:

| | Subject. | Introduced by |
|---|---|---|
| 1. | "Description of Sunderland Corporation Tramways System" .. .. .. | Mr. A. R. Dayson. |
| 2. | "Interim Report of Rail Corrugation Committee" .. .. .. .. | Mr. R. H. Wilkinson. |
| 3. | "Petrol and Trackless Trolley Vehicles" | Mr. C. J. Spencer. |
| 4. | "Standardisation of Specifications for Tramcar Equipments" .. .. .. | Mr. J. W. Hame. |

Useful and interesting discussions took place on these subjects, and the Conference proved very successful. The Sunderland Corporation extended a hearty welcome to the members, and the Council Chamber at the Town Hall was kindly placed at their disposal for their meetings. The Sunderland and South Shields Corporations kindly entertained the members during their stay in the district.

SLOW-MOVING TRAFFIC ON TRAMWAY TRACK.—The Executive Council have had under consideration the question of slow-moving vehicles keeping as near the kerb as possible, in order not to impede fast-moving traffic and interfere with the tramway traffic. Information has been obtained from a number of systems as to the by-laws in operation dealing with this matter, and it is hoped that some general legislation will be framed which will enable local authorities to deal more effectively with owners of road vehicles.

ROAD MAINTENANCE.—The attention of the Executive Council was drawn to a resolution of the County Councils' Association passed at a meeting held on Wednesday, April 23, 1913, suggesting that steps be taken to eliminate from private bills clauses proposing to give such powers for the construction of trackless trolley systems, or the running of motor 'buses within administrative county areas. The matter was considered at an extraordinary general meeting held in London on June 18, 1913, when the following resolution was passed:

"That this extraordinary general meeting of the Municipal Tramways Association held on Wednesday, June 18, 1913, having had their attention drawn to a resolution of the Executive Council of the County Councils' Association passed at a meeting held on Wednesday, April 23, 1913, suggesting that steps be taken to eliminate from private bills clauses proposing to give powers for the construction of trackless trolley systems, or the running of motor omnibuses within administrative county areas, desires to record its disagreement with such resolution, and to point out that such action would have the effect of delaying local legislation for the provision of transit facilities by road vehicles in districts where such facilities are now urgently required, and

Digitized by Google

hereby instructs the Executive Council of the Municipal Tramways Association to take such steps as will result in general and more equitable legislation with regard to the whole question of road maintenance, and to act, if and when necessary, with other associations who may be moving in the same direction."

MOTOR OMNIBUS COMPETITION. The question of motor omnibus competition in the metropolitan area has had the consideration of the Executive Council during the year. It was felt, however, that as a Select Committee of the House of Commons was investigating the matter, no action could well be taken at that time. The report of the Select Committee has been issued and is now under consideration by the Executive Council. Resolutions urging the Government to pass such legislation as will place motor omnibus companies on terms of equality with regard to public obligations with the municipal tramway authorities in the metropolitan area have been passed by a large number of the metropolitan authorities.

MR. J. W. COURTENAY (*Deceased*).—The Executive Council regret to report the death of Mr. J. W. Courtenay, who for many years has been closely connected with tramway undertakings. Mr. J. B. Hamilton, of Leeds, attended the funeral on behalf of the Association, and a vote of condolence was passed when the members were in conference at Sunderland and conveyed to Mrs. Courtenay and family.

LONDON AND SOUTH-WESTERN RAILWAY BILL, 1913. The Executive Council have to report that during last session the London and South-Western Railway Company promoted a bill in which they sought power to own and operate road vehicles and to convey persons' luggage, parcels, and goods to and from any of their stations. It was decided that the Council should give every assistance to the town clerk of Croydon, whose Corporation was petitioning against the bill, and endeavour to get the railway company to delete the clauses, or, alternatively, adopt the model clause which the Association has been successful in getting inserted in similar bills. As a result of negotiations between the town clerk of Croydon and the railway company, the provisions were subsequently withdrawn.

RATING OF TRAMWAYS.—The Executive Council note, with regret, that as a result of appeal to the House of Lords (the Lord High Chancellor, Lord Shaw, and Lord Moulton), the decision of the Divisional Court in the case of the Tottenham Urban District Council *v.* the Metropolitan Electric Tramways, Limited, has been upheld. It will be remembered that the Divisional Court formally affirmed the decision of the justices, being of the opinion that they were bound by the Swansea judgment. The company appealed, and when this case was before Lords Justices Farwell and Kennedy and Mr. Justice Warrington it was held that the tramways were "land used as a railway," and fell within the partial exception from rating as such, conferred by section 211 (1) (b) of the Public Health Act, 1875, and accordingly the Swansea judgment of 1892 was reversed. The recent decision, however, of the House of Lords will have the effect of tramway undertakings again being rated on the full net annual value.

L.C.C. (TRAMWAYS AND IMPROVEMENTS) BILL, 1913.—The London County Council, in the last session, promoted a bill under which power was sought by clause 30 for the Council to work, when purchased, certain short lengths of tramway in London which are not covered by its general powers to work tramways. These short lengths include about one mile of the London United Tramway Company's system. The company opposed clause 30, with the result that clause 31, conferring on the London United Tramways Company compulsory running powers over the whole of the lines of the company in London (about 5¾ miles) now being purchased by the Council, was inserted in the above bill by a Select Committee of the House of Commons. It was felt that some effort should be made to endeavour to get the clause conferring compulsory running powers on the London United Tramways Company deleted, and the members of the Association directed their efforts towards this end by approaching their respective members of Parliament, with the result that the clause was removed when the bill was before the House of Commons. The London County Council have expressed their appreciation of the valued assistance of the members, and the Executive Council take this opportunity of expressing their thanks to the town clerks and members of the Association for their assistance in securing this result.

By order of the Executive Council,

A. R. FEARNLEY, *President.*

C. J. SPENCER, *Hon. Secretary and Treasurer.*

## A LADY'S IMPRESSION OF THE CONFERENCE.

No longer shall we hesitate to pass the salt, never again shall we mind walking under the most formidable looking ladder, for the "City of Steel" has dealt the final blow to superstition—an unwelcome legacy of the dark ages. It has proved in a convincing and uncompromising manner that number 13 can no longer inspire the fear, even the secret terror we entertained for it. This last Conference one might have expected to be an unlucky one; instead Sheffield has set tradition at nought and scoffed at the tales of old wives.

Not only in its tramways is Sheffield up-to-date, but the Corporation have clearly demonstrated their belief in the equality of women; not an invitation or function was there to which we were not asked. It would require a Dr. Johnson adequately to describe the hospitality the Conference received. It may have been out of compliment to Mrs. Pankhurst, who leaves an explosive shell in preference to her visiting card, that on more than one occasion we received "bombes" of a type pleasant to the eye and taste. It would be interesting to know, by the way, if any of the tramway managers have nightmares—one could not say dreams—of a time when women might try to oust them from their posts. In the meantime, however, most of us, I expect, are content to leave the managing of tramways alone and seek a more successful sphere, in managing the managers.

The Tramways Conference is an ideal gathering for those of us who are interested in studying characteristics. One does not require to stare pointedly at their subject, but no one could blame us for just taking a cursory glance or two at some interesting face, and with the different peeps we get of people attempt to read their character. This glancing may be conveniently done at meal times, and for this reason it is not wise to choose a chair at breakfast that faces the wall. At present there is no distinctive type of face amongst tramway managers such as would stamp them as such, in the same way that members of the legal profession can be detected. Perhaps this is not to be wondered at when we remember that there have been lawyers since the time of Moses, whilst tramway managers are the outcome of modern ages—only slightly older than the controversial "'bus they have now to tackle."

The question of "where and when" to wear the Conference badges has yet to be solved. Some sport it from the informal reception until the last good-bye has been said. Others wear it in their pockets or bags. This savours of cowardice, but may really be the outcome of a superabundance of modesty. Of course one does not like to pass as a temperance reformer or trade unionist, if one is neither of the two; and this reminds me of a passenger in the train coming back from Welbeck who, after peering suspiciously at the badge, and then at its wearer, said questioningly to him "Out on strike?" "Out on holiday!" was my friend's reply to the short-sighted one.

Space does not permit me to catalogue all the arrangements so hospitably planned for the ladies during the Conference, but mention must be made of the delightful drive to Haddon Hall. The romantic story attached to it greatly added to the charm of the outing, for happily romance is not yet dead—not even tramways nor motor omnibuses can kill it. It may not have been an easy matter for Dorothy Vernon to escape from Haddon Hall—we did not inquire too closely into the truth of the story—but we found it rather a difficult matter to get in at all. The keeper, fearful lest there should be any among the party who had bombs or hammers, insisted on collecting all handbags. In these "hammer and tongs" days one can hardly blame him, but I think if we had been "put on our honour," there would have been no cause for regret. The afternoon at Haddon Hall was all too short. Hours could have been spent at the gorgeous garden at Gridleford, yet minutes had to suffice. It needed but little time to feel the graciousness of our hostess, the Lady Mayoress, and partake of the delightful tea provided for us. We resumed the journey to Sheffield in a Corporation motor omnibus, which glided along like a billiard ball. Some of us who journeyed by motor car were not quite so fortunate as the passengers by omnibus, but "all's well that ends well"; and we reached our hotel in time to prepare hurriedly for the annual dinner. The excursion on the following day to Welbeck, the palatial seat of the Duke of Portland, released the men from their strenuous attendance at the Conference, and they seemed to enjoy the excursion as much as the ladies.

Time warns me that I have exceeded the limit, but before finishing there is one regret I would like to mention, and that is having to say "good-bye" to Sheffield.

L. P.

**The Arbitration Difficulty at Sheffield.**—It will be remembered that the Sheffield tramways employees, although willing to submit to an arbitrator their difference with the Tramways Committee as to time and a half pay for Sunday duty, were unable to agree to the terms of reference drawn up by the town clerk for consideration by Judge Benson. The general manager has now received a letter from the Association of Tramway and Vehicle Workers stating that they would prefer to leave the case in the hands of the Tramways Committee, but they asked the committee to consider an application on behalf of certain employees not already in receipt of time and a half pay for Sunday after five years' service with the department. The general manager has been directed to report on the request.

## THE LACK OF A TRAMWAY ("CONFERENCE") BELL.

By An Irresponsible Member.

The "bell" is a very conspicuous factor in the economy of public and private life. On all hands we see its usefulness demonstrated, and, as a matter of fact, we should find it very difficult to get along without this humble instrument or without some substitute for the same. One of the most useful and indispensable adjuncts to public comfort and convenience is the tramway conductor's bell. It is a necessary part of the tramway conductor's work; does not "strike" except in the legitimate sense of the term; is, as a general rule, absolutely to be relied upon, and when for some reason or other it goes out of order, we find ourselves at once inconvenienced to an extent out of all proportion to the intrinsic importance of the instrument concerned.

There are other bells, of course. They have varied duties to carry out; and, if one tried to understand the psychology of the case, one would be tempted to endue the differing bells with differing qualities according to the functions which they are called upon to perform. One might, for instance, endow the tramway conductor's bell with the quality of "imperiousness"; the motor bell or horn with the same property as that popularly supposed to be possessed by the "Last Trump"; the church bell with notes of "persuasiveness"; the dinner bell with tingles of "joyful anticipation"; the mistress's bell to the kitchen with the tone of mere "suggestiveness" (at least from the maid's point of view); the telephone bell with the "Come, or I'll make you" attribute, and so on. The list might be extended indefinitely.

One is led to reflections such as these by the fact that the conductor of our Conference entirely lacks such an indispensable adjunct to the dispatch of Conference business. We have capable as well as ornamental figures in the chair who wish to see the proceedings carried on with promptness and dispatch. Then we have an exceedingly valuable and illuminating paper read, containing material for four or five hours' discussion. Then, by arrangement, we have an opener of the discussion who appears to misunderstand his function and regales us with another paper, dotting the "i's" and crossing the "t's," and saying "ditto" to the first paper. When he is not doing this he is bringing in extraneous matter of doubtful interest, followed by wearisome details. Following this another speaker gets up and takes about twenty minutes to inform the audience that he does not agree with the writer or the paper. He does not deign to bring forth any facts or figures to prove his contention, probably having the feeling that to do so would unduly tax the mental capacities of his hearers. By this time the period allotted to the discussion of the important subject has been exhausted, and although member after member gets up in a vain effort to be heard, and interjects cross words to "cross benches," the session has to be brought to an end, there having been no real discussion and of necessity no reply.

Where is that Conference bell? Oh! for a bell which has the quality of "remorselessness" in its clang, and which would have the calculated effect of frightening a speaker into his seat when his allotted time had passed. If I were a president and I had to deal with about 200 men, and only a short space of time in which to allow a subject to be ventilated, my right-hand bell would be my right-hand "man." At the outset I would say "Gentlemen, the opener of the discussion will have ten minutes and no longer, the next four speakers will have five minutes each, and all the following speakers will have three minutes, and ten minutes will be allotted to the reply, and you will all kindly keep to the point. Gentlemen, the fiat has gone forth; the bell is in good order, and I wish you to take notice that it will be put into strenuous operation."

By this means the "dreary drip of dilatory declamation," from which we have all at times suffered, would come to an end, and the "hot-air" merchant would be compelled to restrict his output or to change it at short notice into a volume of "compressed" air.

Only in the above way can we economise our time, save our tempers, ventilate a subject, deal out contentment to the listeners, please the person who takes the trouble to write a voluminous paper on a specified subject, and generally give satisfaction all round. May I recommend to the Association, before the next Conference, the purchase of a high-toned instrument calculated to give the utmost satisfaction in the discharge of its duties?

## PREPAYMENT ADVANTAGES AT BRADFORD.

Mr. C. J. Spencer has been interviewed concerning the criticism evoked by the local system of securing payment of top-deck fares before passengers enter the cars. He said that to go "the whole hog" by introducing cars with special platforms would entail in the first place heavy expenditure, and next—in cities which have a complicated system of fares and overlapping stages—the overcoming of a great many technical difficulties. Mr. Spencer added: On being convinced of the success of the Sheffield experiment, both Leeds and Bradford decided to adopt the system, for the purpose of easing the work of the conductor, and to reduce the number of accidents occasioned by people alighting while the cars were in motion, and while the conductor was on the top deck collecting fares. The system came into operation on June 1. Taking the period of 10 months previous to that date, the average number of cases of passengers receiving injuries—mostly of a slight character—while alighting from the cars was 56 per month. Since June 1 up to date the average number of such cases has been reduced to 33 per month—a decrease of 41 per cent. With regard to the suggestion that had been made that the system lent itself more easily to fraud, Mr. Spencer observed that arrangements were made to prevent this, but that, of course, was a managerial matter. The reports from ticket inspectors as to finding passengers without tickets or riding over the stage had very considerably decreased since the scheme came into operation—from which the fair inference to draw was that the scheme was more effective in the prevention of fraud. He had not had a single complaint yet of a passenger being delayed in arriving at his destination as a result of the new method of collecting fares. Even if a car did leave the terminus half a minute or a minute late it would gain the time in shorter stoppages on the journey. Conductors were allowed discretion within reasonable limits as to whether they would allow passengers to go on the top deck without first paying their fare.

## MAZDA LAMPS IN RAILWAY SERVICE.

The most necessary quality which is required in lamps used in railway work is mechanical strength. That this quality is possessed by Mazda drawn-wire lamps is well shown by the instructive diagram reproduced below. This diagram is self-explanatory, and it is interesting because it translates the improved strength of the Mazda lamps into the pounds, shillings, and pence of reduced maintenance costs. The curve was prepared by the Chicago and Rock Island Railway of America, and shows the average maintenance costs per car per month for lamps, renewals, and labour over a period of four years.

**Mazda Lamps in Railway Service.**

In the first year the ordinary "pressed" filament tungsten lamps were used, and the average monthly cost per car was 18s. 6d. In the second year so-called "wire" lamps were used, and the maintenance cost was 26s. 3d. Mazda drawn-wire lamps were employed in the third and fourth years, and the average monthly maintenance cost per car was 14s. 5d. and 6s. 9d. respectively. The lower figure in 1912 was due to the improved strength of the Mazda lamps used in that year. Information in regard to the special types of Mazda lamps which have recently been developed for railway service, can be obtained from the British Thomson-Houston Company, Limited, Mazda House, 77, Upper Thames Street, London, E.C.

**New St. Petersburg Car Depots.**—When the first series of tramways was constructed in St. Petersburg new depots were not built. The old horse car depots were used. It was quite impossible to effect many of the repairs that became necessary, and cars more than slightly damaged had to be sent to the factories. But with the second series of tramways new car sheds are being built, the largest of which is the Rozhdestvenski depot, which occupies a surface of 102,900 square feet. The car sheds will accommodate 200 cars so disposed as to be examined on all sides, with pits between rails for their inspection from below. The buildings are mainly ferro-concrete. Administrative offices three to six stories high are being added. This establishment is expected to be opened in November, when the second series of tramways is to be inaugurated. A second depot, occupying 72,030 square feet, is under construction in Bulfovoi Ulitz for 120 cars.

**More Omibuses for Liverpool.**—Proposals are under consideration by the Tramways Committee for purchasing additional omnibuses in order to extend the services to districts not at present provided with means of locomotion. On October 6 the type of vehicle in use by the Sheffield Tramways Committee was inspected at Liverpool and tested on a route which included the Erskine Street hill. Other types of vehicle are also to be inspected.

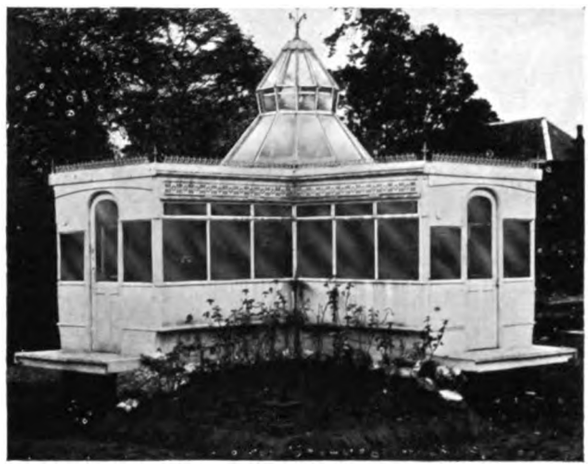
## A NOVEL USE FOR OLD CARS.

The Glasgow Tramways Department are disposing of the old horse cars which, in 1901, were converted into electric cars. These cars are, of course, much smaller than the present standard cars, and are no longer suitable for the traffic. The bodies of the old cars have been sold for different purposes, and a resident of Glasgow, who has a summer home on the banks of Loch Lomond, recently purchased two

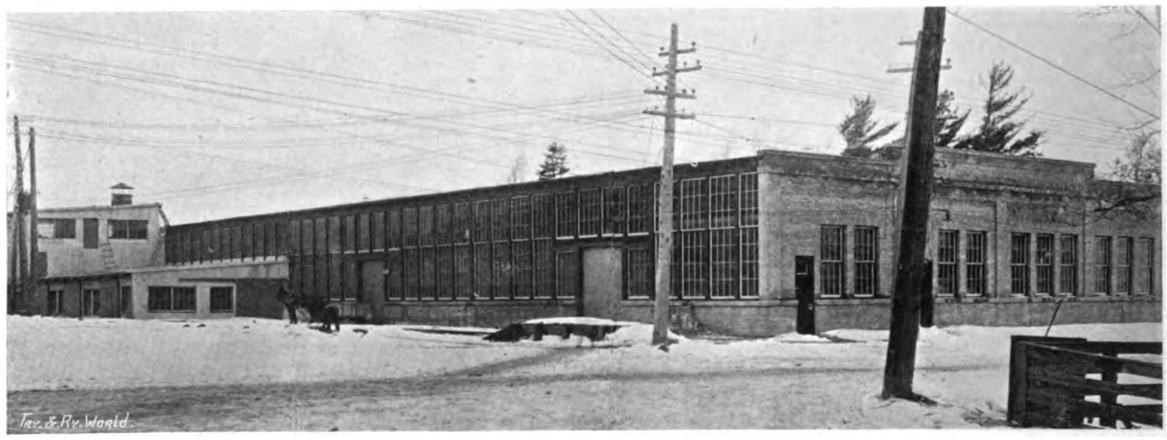


Summer House Made of Old Cars.

car bodies. Each car was cut in two, and from them the summer house shown in the accompanying illustrations has been constructed. By the embellishment of the glass cupola, the architect has constructed a somewhat ornate building, without by any means concealing the origin of the design.

## THE MANUFACTURE OF BRAKE BLOCKS IN CANADA.

The accompanying illustration shows the works which have been erected in Sherbrooke, Canada, by the National Rail and Tramway Appliances Company, of Liverpool. The National Company's steel back block is now largely adopted by the principal tramway and electric railway companies, and the works which have been established in Canada are calculated to spread the knowledge and use of the firm's specialties in that country. The Canadian works, which are capable of turning out 70 tons per day of iron, steel, and brass parts, are managed by Mr. P. McCullough, who was formerly with the company at Liverpool. It is intended to establish works in other important centres, in order to cope with the increased demand for the steel back brake blocks.



National Rail Appliances Company's Works in Canada.

**Birmingham Resisting Overhead Telephone Wires.**—The Birmingham stipendiary magistrate is hearing a series of test cases brought by the Corporation against the claim of the Postmaster-General to erect overhead wires for the development of the suburban telephone service. It is understood that the matter will be carried to appeal if necessary. An offer was made that when the number of overhead wires on a route exceeded 32, the service for 16 subscribers, underground communication would be substituted.

## ILLUMINATION OF STOPPING PLACE SIGNS.

The illustration below shows a pole fitting for illuminating the notices of tramcar stopping places which is supplied by the Equipment and Engineering Company, of 2, Norfolk Street, London, E.C. This fitting has been supplied to some of the largest tramway systems in the United Kingdom, and the special claims put forward for it are that it is simple in construction, effective in use, low in initial cost, and is easily erected on the poles. The apparatus consists of a lamp fitting and high-tension switch box, the switch gear of which is specially insulated for use on from 500 to 550 volt circuits, and it is operated by mechanism outside the box. The lamp fitting and the switch gear are enclosed in a cast-iron water-tight case of massive design. The utility of such an arrangement, especially from the passengers' point of view, is obvious.

A Light for Stopping Place Signs.

**Penalty for Catching Hold of a Tramcar.**—A cyclist has been summoned at Lambeth for catching hold of the side of a tramcar ascending Dog Kennel Hill, East Dulwich. A police-constable informed the magistrate that one section of the Police Act, 1839, provided that any person who caused himself to be carried or drawn by any carriage within the Metropolitan Police district without the consent of the driver was liable to a fine of not more than 5s. The magistrate dismissed the summons on defendant paying costs.

**Tramway Rail Welding.**—Mr. Fearnley's remarks before the Municipal Tramways Association at Sheffield, that the mechanical joint was "fast being superseded," is amply borne out by the list of contracts which Messrs. Thermit, Limited, have on hand at the present time. These include Bradford, Bristol, Burnley, Brighton, Bournemouth, Dublin, Dundee, Huddersfield, Leeds, Liverpool, London County Council (fourth contract), London United Tramways, Manchester, Sheffield, Southampton, etc. No better proof of the popularity and efficiency of the joint could be asked for. We understand that arrangements can be made to see the process in operation at any of these places, by communicating with Messrs. Thermit, Limited, 27, Martin's Lane, Cannon Street, E.C.

## FINANCIAL REPORTS.

**Winnipeg Electric Railway Company.**—A quarterly dividend of 3 per cent. is announced, payable October 1.

**Lima Light, Power, and Tramways Company.**—The board announce a dividend of 1 per cent. for the second quarter of the year.

**Hurst, Nelson, and Company.**—The accounts for the year ended July, 1913, will permit of the arrears of preference dividend being paid up on November 11, 1913, together with dividend for the half-year ending on that date.

**Gateshead Tramways.**—An interim dividend at the rate of 5 per cent. per annum for the half-year ended June 30 has been declared on the ordinary shares. The interim dividends on the 5 per cent. and 6 per cent. preference shares will also be paid.

**Oldham Tramways.**—The accounts of the Corporation tramways for the year ended March 31 last show a net balance of £4,549, while last year there was a deficiency of £2,413. The revenue was £108,000, and £15,458 has been placed to sinking fund. Over 21,000,000 passengers were carried, and the average traffic revenue per car-mile was 12·645d. The average fare per passenger came to 1·19d. There are 92 cars. The gross capital expenditure has been £442,000, and £111,417 has been applied in the reduction of debt.

**Dumbarton Tramways First Dividend on Ordinary Shares.**—At the general meeting on September 1 the directors recommended a dividend on the ordinary shares for the first time of 1½ per cent. per annum on the issued and paid up ordinary share capital. A dividend on the preference shares at the rate of 6 per cent. per annum was also declared. Mr. George Balfour, the chairman, said the receipts for the year amounted to £22,952, an increase of £578, against which increased expenses had been incurred amounting to £1,015.

**Continued Progress at Preston.**—The annual accounts of the Corporation tramways show an increase of £2,609 in the traffic receipts as compared with the previous year, in which those of 1911 had been exceeded by £2,581, the earnings per mile being 10·50d., as compared with 10·34d., while the working expenses per mile remained at 5·96d. The surplus is £9,023, of which £3,648 has been expended in three new cars, top decks to five others, new shelter on the Garstang road, etc., leaving £5,374 to be carried to the reserve fund, which now stands at £36,840. The tramway sinking fund amounts to £42,001.

**A Portsmouth View of Municipal Tramway Deficits.**—The accounts of the Portsmouth Tramways Committee for the year ended March 31 show that a balance of £10,657 has been allocated as follows: £4,000 to the Borough Fund, £3,000 to the Fire and Insurance Fund, £350 for depreciation, and £3,306 for carrying forward. During a discussion on the advisability of halfpenny fares, Councillor Pink said the time was not opportune to take any risk by revising fares. At Glasgow, where there were halfpenny fares, there were 11 non-paying routes. Out of 94 Corporation systems he pointed out that 54 were failures owing to the fact that they tried to give too much for the money.

**Automatic Route Indicators.**—There are being introduced to the Stock Exchange the shares of the Route Recording Advertiser, Limited. The company are dealing in an automatic device for use in tramway cars and omnibuses to indicate the route. A street plan indicating all turnings and points of interest along the route moves automatically in accordance with the progress of the vehicle, about half a mile of the route being visible at a time. The company have a capital of £12,000 in five shilling shares, and the directors include Mr. Edward R. Soames, who is a director of the London Suburban Traction Company, which controls the Metropolitan Electric and London United Tramways and the M.E.T. Omnibuses.

**Ayr Tramways.**—In his annual report on the working of the Ayr Corporation electric tramways the general manager (Mr. W. Grant) states that the total revenue for the year amounted to £16,295, being the highest in the history of the department. The passengers numbered 3,880,850, an increase of 3·62 per cent. Halfpenny fares represented 55·33 per cent. of the passengers and 28·63 per cent. of the receipts, penny fares 17·86 and 18·49, and twopenny fares 12·29 and 25·46 respectively. The net balance amounted to £3,378, of which £2,040 was carried to the depreciation and renewals fund and £1,337 transferred to the burgh general assessments. The depreciation and renewals fund amounts to £9,918, while there is also a reserve fund of £5,000.

**Halifax Tramways.**—The annual report states that the amount expended on capital account at March 31 last was £412,762, and the mortgage debt stood at £299,480. The net profit was £12,680, or 1·41d. per car-mile, compared with £18,020, or 2·06d. per car-mile in the previous year, and £11,514, or 1·45d. per car-mile in 1911. The revenue was £105,973, or 11·82d. per car-mile, and the working expenses £69,661, or 7·77d. per car-mile, compared respectively with £101,893, or 11·63d. per car-mile, and £62,890, or 7·18d. per car-mile in the previous year. The route mileage was now equal to 54 miles 1,549 yards of single track, and the average energy consumption per car-mile run was 1·81 units as against 1·69 units the year before. The gross profit is equal to 8·94 per cent. on the capital expenditure, and the net profit equal to 3 per cent.

**Dick, Kerr, and Company, Limited.**—The report states that the profits earned during the 12 months to June 30 last amount to £30,092, which, added to £10,016, the sum forward, makes a total of £40,108. Out of this sum the debenture interests have been paid, and there has been reserved the sum required to provide for the premium payable on the redemption of the present debenture stock. These items absorb £11,483, leaving £28,624 available. The general meeting held on October 9 approved of the payment of a dividend of 6 per cent. per annum on the preference shares, and to carry forward £10,324. Whilst the profits for the year are sufficient to cover the payment of the debenture interest and the preference dividend, leaving the profit to be carried forward slightly larger than the amount brought forward from last year, the directors regretted that they were unable to recommend a dividend on the ordinary shares. A report of the meeting is given on page 363.

**Blackpool's Record Receipts per Car-Mile.**—The annual report of Mr. Charles Furness, general manager, Blackpool Tramways, states that the year's receipts were £74,166, and the gross profit £34,484. Compared with the previous year the receipts increased by £8,826, gross profit by £9,378, net surplus by £8,278, passengers by 1,083,491, and mileage by 107,286. Working expenses showed a decrease of £552. The receipts increased on all routes, the largest being on the circular tour, which amounted to £4,857. The average receipts per car-mile reached the record figure of 16·93d. Mr. Furness points out that the expenditure on the permanent way is an increasing factor, and, therefore, it was desirable that not less than £10,000 be allocated annually to the fund for the next five years. Since the adoption of car meters and the keeping of a complete record, a considerable saving had been effected in the energy consumption per car-mile, which was 1·33 units.

**United Electric Car Company.**—The report of the United Electric Car Company, Limited, Preston, for the year ended June 30, states that after paying debenture interest amounting to £1,783, and charging £5,950 for depreciation, the profit for the year was £10,809, to which was added £4,249, brought forward from last year, making a total of £15,058. After deducting £3,000 for preference dividend for the six months ended December 31, 1912, there was an available balance of £12,058. The directors recommend its allocation as follows: £3,000 to pay the preference dividend for the half-year ended June 30 last; £7,500 to pay a dividend of 5 per cent. on the ordinary shares for the year; and £1,558 to carry forward.—The annual meeting was held on September 17. Mr. Robert L. Barningham, the chairman, said the year's working was not so satisfactory as that of the previous year. The net profit on that occasion was the best since 1907, viz., £15,267. The past year had certainly not been a boom year in the demand for tramcars, and in the circumstances the directors considered the net profits of £10,809 satisfactory. The keen competition had mainly affected them for foreign work, and had come chiefly from American and Continental firms. The order books and prospects were slightly better than 12 months ago. They should take the earliest opportunity to build up their general reserve to provide for the loss in the realisation of the Hadley and Trafford Park works. The report was adopted, and it was decided to pay a dividend of 5 per cent. on the ordinary shares, and to carry forward £1,558. Messrs. R. H. Prestwich (Manchester) and John Kerr were re-elected directors.

**Sound Finance at Bradford.**—Interesting additions have been made by Mr. C. J. Spencer, general manager of the Bradford Corporation Tramways, to his annual report on the working of the undertaking to March 31 last, as issued in booklet form. The financial details of this, the fifteenth yearly report, were noted in the issue of this journal for July 10 last. "The operating difficulties of the Bradford tramways system," Mr. Spencer says, "are of a rather extraordinary character. From a commercial point of view the heavy operating expenses, due to steep gradients and constant wear and tear, are unavoidable, as is also the disadvantage of a very low density of population per route-mile." Having regard to these difficulties the Corporation may congratulate themselves not only on having a good service of cars, but that in addition to meeting all dues and demands they are able to contribute annually a substantial amount to the relief of rates, pay good wages, and possess a reserve and renewals fund amounting to about £90,000. Only two fatal accidents have occurred during the 15 years. The outstanding feature of the accounts is the very gratifying increase in total revenue, notwithstanding the heavy decrease in fares for early morning traffic. "The tramways department has arrived," the report says, "at what may be termed the half-way house, inasmuch as the loans for tramway purposes were granted generally for 30 years, and, as will be seen from a perusal of the accounts of the city treasurer, nearly half the capital borrowed for tramway purposes has been repaid." On the Bradford railless trolley car installation, one mile 460 yards in length, there is a loss shown on the face of the accounts. Whether this is a real loss or whether it is more than made up by increased tramway traffic it is impossible to say. The vehicles are of the pioneer type, and are to be replaced by cars of later design.

## PERSONAL.

**Mr. C. H. Chester,** traffic superintendent of the Salford Corporation Tramways, has obtained an appointment in New Zealand.

**Messrs. Merz and McLellan,** of London, are acting as consulting engineers to Perth Council (Western Australia) in connection with the scheme for erecting a new power-house.

**Mr. W. N. Brooks,** traffic superintendent, Brighton Corporation Tramways, has been granted an increase in salary. He was appointed in March, 1909, and has since received two increases.

**Mr. E. Seckington,** traffic superintendent of the Bath Tramways Company, was presented with a silver cigarette case, suitably inscribed, by the passengers who took part in the first of the six-day motor tours.

**Sir John Courtis,** chairman of Cardiff Tramways Committee, spent the vacation in America. On attending a meeting of the Tramways Committee on October 7, Sir John was heartily welcomed.

**Mr. C. W. Shepherd,** general manager of the Edinburgh Tramways, recently underwent an operation for appendicitis at the Isle of Man, while on holiday. The operation was in every way successful.

**Mr. R. W. Willis** has resigned his position as chief assistant electrical and mechanical engineer to Swindon Corporation, in order to become principal assistant to Mr. R. A. Smith, consulting engineer, Westminster.

**Mr. H. G. Matthews,** who is referred to by a local journal as the popular manager of the Quebec Railway, Light, and Power Company, has reported that the company are making record profits, and that this year will prove to be the most successful on record.

**Mr. Stanley Dudman,** late manager of the Dartford tramways for Balfour, Beatty and Company, Limited, has been appointed to take charge of the firm's new tramways between Ripley and Nottingham. Mr. D. N. R. Bruce, late of Stroud (Glos.), has become manager at Dartford.

**Mr. A. J. Pembery,** of the india-rubber department of Siemens Brothers, Limited, Woolwich, on the completion of 50 years' service, has been presented by the firm with a purse of gold, and by the staff and employees with a gold watch and chain, and a gold mounted umbrella for Mrs. Pembery.

**Mr. J. P. Tierney,** general manager of the Dublin and Blessington Steam Tramways Company, was complimented, at the general meeting of the shareholders, in respect to his energetic efforts to improve the company's affairs. It was decided to pay a dividend at the rate of 5 per cent. per annum for the half-year.

**Mr. H. F. Friederichs,** electrical engineer to West Hartlepool Council, has had his salary increased, without application for an increment, from £450 to £500, in recognition of the great amount of work which had fallen upon him in connection with the scheme for utilising waste heat from the local blast furnaces.

**Mr. E. P. Grove** arrived at Melbourne about the middle of September to supervise the works in connection with electrification of the suburban railways on behalf of Mr. C. H. Merz. Mr. Stone, the electrical engineer to the Victorian Railways Department, will not take charge until the electrification has been completed.

**Mr. Henry Mozley,** general manager of Burnley Corporation Tramways, has accepted nomination to the position of vice-president of the Burnley and District Chamber of Commerce. He also represented that Chamber at the annual autumn meeting of the Association of Chambers of Commerce of the United Kingdom, held at Antwerp on September 16 and 17.

**Mr. Leonard Johnston,** general manager and electrical engineer, Gloucester Corporation Tramways, was on September 12 appointed tramways manager at Southampton out of 38 applicants, and entered upon the appointment about the middle of October. The salary is £400 per annum. Mr. Johnston has been at Gloucester since January, 1909, and under his management considerable improvement has been made in the service, while the financial position has also improved. He was formerly connected with the Blackburn tramways.

**Mr. J. M. McElroy,** general manager of Manchester Corporation Tramways, during September paid a visit to the Continent to study traffic conditions, in continuation of the attention which he gave to the question during the recent visit to America. Among other places he visited were Paris, Vienna, Berlin, and Hamburg. Mr. McElroy proposes to make a thorough inspection of the traffic position in London, and eventually will make a full report to the Corporation as to methods adopted in various cities, and on the question of how best to deal with the traffic problem in Manchester.

**Mr. F. J. S. Hosken,** general manager and engineer, Darwen Corporation Tramways, was the subject of a complimentary notice in a local journal in connection with his proposal (adopted by the Tramways Committee) for the issue of a return ticket on the Bolton Road section, and a penny return dinner-hour ticket on all sections to or from the Circus. The writer observed that since Mr. Hosken was appointed to the position of manager with full control he has introduced many reforms which have worked well and been appreciated.

**Mr. Alex. Hannan,** of the general office staff, Wallasey Corporation Tramways, after 12½ years' service, has left to take up an important position in Chile, and the occasion has been marked by three presentations. Mr. Hannan received from the general manager (Colonel R. R. Green, V.D.) a leather morocco lined attaché case; a silver cigarette case from the office staff; and a travelling trunk from the Tramways and Electricity Departments' Social Club, of which club Mr. Hannan had acted as hon. secretary. The presentations were made by the general manager.

**Mr. R. L. Horsfield,** tramways manager to Walsall Council, was recommended by the Tramways Committee for an increase in salary from £400 to £500 by half-yearly increments of £25. The General Purposes Committee disapproved of the recommendation, but at the September meeting of the Corporation Ald. J. Cope, chairman of the Tramways Committee, moved an amendment that his committee's recommendation should be approved, and observed that the manager had earned their confidence during the 10 years he had been with them. The amendment was lost by 12 votes to 15, the report being approved.

**Mr. W. German,** who for 14 years has been connected with the engineering and traffic departments of Blackpool Corporation Tramways, has been presented with a gold watch by his colleagues on the occasion of his departure to fill another local appointment. In making the presentation, Mr. Charles Furness, the borough electrical and tramways manager, said he was glad to learn that Mr. German had improved his position. It was on such occasions as applying for new positions that character counted, and he was happy and proud to say that the men of the Blackpool tramways department had a very high standard of character.

**Bradford Tramways Committee** have received a resolution from the local branch of the Amalgamated Association of Tramway and Vehicle Workers tendering to the chairman and members their thanks for the generous manner in which the committee dealt with an application for an advance of wages for conductors and others. Acknowledgment is made of the unfailing courtesy and consideration with which the tramways manager (Mr. C. J. Spencer) has at all times met the men, and the hope is expressed that the better conditions of service now prevailing may result in an even higher standard of service than that which has obtained in the past.

**Presentations to Mr. H. E. Blain.**—At a largely attended gathering of employees of the West Ham Corporation Tramways and their friends, Mr. H. E. Blain, who vacated the position of tramways manager recently, received further presentations on behalf of the staff. The gifts of the Employees' Social and Athletic Club were a handsome French gilt drawing-room clock with two painted china ornaments, whilst presents from the inspectors' staff were a crocodile cigar case and a gold-mounted amber cigar holder. Mr. Blain has also been the recipient of a very artistic illuminated and framed testimonial under the seal of the West Ham Corporation over the signatures of the Mayor and Town Clerk, testifying the appreciation of the Council of his services during his 10 years in West Ham.

---

**Mr. C. T. Hargreaves** was killed by electric shock on August 23, at Santos, Brazil, where he was engaged with the Santos City Improvements Company. Mr. Hargreaves, who was 29 years of age, was formerly an electrician in the Blackpool tramways department.

**The late Mr. Anthony N. Brady,** the tramway, gas, and electric power promoter, who died suddenly in the Carlton Hotel, London, on July 22, left a will, which, after making ample provision for the support of the widow, divides the balance of the estate, which is estimated at £14,000,000, among five children and one grandchild.

**Mr. Frame Thomson,** who on September 28 was found dead in his house at Highgate, was to have sailed on October 3 for South America. Mr. Thomson was a director of the following companies: Alliance Investment, Anglo-Argentine Tramways (deputy-chairman), Cordoba Light, Power, and Traction (chairman), La Plata Electric Tramways, and United Electric Tramways of Monte Video (deputy-chairman). At the inquest it was stated that the deceased was extracting a cartridge from a gun he kept for shooting pigeons when the charge entered his body. The jury found that the occurrence was accidental.

**Mr. James Farley,** whose death was announced on September 13, at the age of 36, at New York, was a specialist in breaking down street car strikes. He was originally a tramway man in Philadelphia, and, it is said, came out on strike. The strike failed, and Farley's wife died from the hardships she had to endure. From that day Farley devoted his life to fighting the trade unions. At first he offered only his own services, but he soon saw the commercial possibilities of strike-breaking. He organised a staff of men who were at the same time skilled workmen and were armed with revolvers, and paid them a retainer of 4s. a day. It is stated that he has left a fortune of £100,000.

## CONTRACTS AND ORDERS.

**Crompton and Company** have obtained a contract from Doncaster Council for the supply of feeder panels.

**Wigan Council** have given the contract for painting the tramway standards to Messrs. Dawber and Cheetham.

**Stalybridge Joint Tramways and Electricity Board** have ordered a second motor wagon from Fodens, Limited, at £521.

**Bacup Council** have given a contract to W. T. Glover and Company, Limited, for the supply and laying of 4,000 yards of cable.

**The Dunlop Rubber Company** have received a contract for the supply of solid tyres to the Sheffield Corporation's motor omnibuses.

**British Insulated and Helsby Cables** have received from the Victorian Railways Department a contract for the supply of rail bonds.

**British Westinghouse Company** have received an order for 24 gear wheels for tramcars, at £2 13s. 6d. each, from Yarmouth Council.

**The Canadian Westinghouse Company** have received a contract for the supply of three generators for the Winnipeg municipal power-house.

**Derby Council** have been recommended to make a new contract with the Bell Punch and Advertising Company for the supply of tramway tickets.

**J. W. Courtenay, Limited,** have been reappointed sole advertising contractors to the Liverpool Corporation Tramways for a long term of years.

**Babcock and Wilcox, Limited,** have received a contract for the supply of a boiler, superheater, and mechanical stoker at Southampton electricity works, at £1,661.

**Walthamstow Council** have accepted the tender of W. T. Henley's Telegraph Works Company for the supply of 550 yards of 3-core l.t. cable, at £200 10s.

**Ilford Council** have placed an order with the British Insulated and Helsby Cables for a mile of tramway trolley wire at 9$\frac{1}{16}$d. per lb., less 2½ per cent. discount.

**Siemens Bros. Dynamo Works, Limited,** have been awarded the yearly contract for the supply of "Tantalum" traction lamps for Rotherham Corporation tramways.

**An Electric Tower Wagon.**—Ilford Council have decided to purchase a motor tower wagon, equipped with the Edison storage battery, at £689, from the Edison Accumulators, Limited.

**Dundee Council** have given contracts to Bruce Peebles and Company, Limited, for converting machinery, at £1,500; and to the British Insulated and Helsby Cables, Limited, for cables.

**Bexley Council** have accepted the offer of the Hart Accumulator Company, Limited, for renewing and enlarging the battery, at £500, and a tender by Siemens Brothers for a motor-generator, at £300.

**Hobart Council** are buying a six months' supply of tramway tickets in England The estimated cost is £123, and it is declared that it would cost four times as much to have the tickets printed locally.

**Westinghouse Machine Company** have, according to American engineering journals, received a contract for the supply of three turbo-generating units, each of 30,000 KW. capacity, for the New York subway extension.

**Melbourne Municipality** have accepted the following tenders: Spare armature for 500-KW. motor generator, British General Electric Company, £200; insulated copper cables, British Insulated and Helsby Cables, Limited, £1,361.

**Salford Council** have placed contracts as subjoined: Ferranti, Limited, three-phase to two-phase switch gear, including static transformers, £1,085; Switchgear and Cowans, Limited, regulators for above switch gear, £283 10s.

**Plymouth Tramways Committee** have accepted an offer by the contractors for the supply of clothing to the tramway employees to extend the period of the contract from one to three years, and to allow a reduction of 2½ per cent. in price.

**Halifax Tramways Committee** have allotted a contract to Bolckow, Vaughan, and Company, Limited, for the supply and delivery of 200 tons of steel girder rails and 7 tons of steel fish plates, at £7 per ton, subject to the rails being made in this country.

**Mr. John Taylor,** of Strand Street, Liverpool, has recently received the following orders for his patent tubular sanding devices: County Borough of Rotherham, for 100; the Brush Electrical Engineering Company, Limited, for 20, for the Salford Corporation cars.

**Lincoln Council** have allotted contracts as appended: Willans and Robinson, Limited, turbo-alternator; Howden Boiler Company, water-tube boiler; George Robson and Company, coal elevating and conveying plant; Thornhill Brothers, extensions to the electricity works.

**Burnley Council** have placed a contract with the British Insulated and Helsby Cables, Limited, for the supply of 1,000 yards of lead-covered cable, and with the British Thomson-Houston Company for the supply of electric motors required by the Electricity Committee up to March next.

**Thermit, Limited,** have on hand at the present time tramway rail welding contracts at Bradford, Burnley, Brighton, Bournemouth, Dublin, Dundee, Huddersfield, Leeds, Liverpool, London County Council (four contracts), London United Tramways, Manchester, Sheffield, Southampton, etc.

**Wimbledon Council** have accepted the following tenders: British Thomson-Houston Company, 1,500-KW. turbo-alternator, condensing plant, pipework, and auxiliaries, £8,711; Herbert Morris, Limited, overhead travelling crane, £258; British Electric Transformer Company, one 75-KW. and one 50-KW. electric transformer, £123.

**The Albion Motor Car Company, Limited,** have received an order from the South African Government Railways for 12 32-H.P. Albions. This is the largest order ever placed by the South African Government, and is the result of the previous satisfaction they have had with the Albion vehicles which they purchased some years ago.

**Sheffield Council** have allotted contracts to Stuart and Moore for the installation of 50 patent telephonic street alarms, £4,097; Blasberg Engineering Company, supply and direction of two natural draught cooling towers, £8,779; Royce, Limited, supply and erection of three electric capstans, together with three fairleads, wire ropes, motors, etc., £1,128.

**Bournemouth Council** have placed a contract with W. Griffiths and Company, for reconstruction of tramways in Wimbourne Road, Charminster Road, and from Park Gates West to Poole terminus, including Thermit joints on each section, at £14,621 15s. There were seven tenders. The tender of Walter Scott, Limited, has been accepted for the supply of rails and fastenings, at £6,067 10s.

**Accrington Council** have placed contracts as appended: Armoured cable, W. T. Glover and Company, Limited; switch panels at Clayton-le-Moors sub-station and Rishton paper mills terminus, British Thomson-Houston Company; 250-KW. motor converter, Bruce Peebles and Company; one 100-K.V.A. and one 200-K.V.A. static transformer and one oil switch, British Westinghouse Company, Limited.

**Manchester Council** have awarded the following contracts: Water softening plant at Stuart Street Station, Kennicott Water Softener Company, Limited; construction of new meter repair workshop at the Polygon Stores, Messrs. J. Gerrard and Sons, Limited; cables, W. T. Henley's Telegraph Works Company, Limited, Callender's Cable and Construction Company, Limited, and Messrs. Johnson and Phillips.

**Warrington Council** have accepted the following tenders: Premier Accumulator Company, battery, booster, and switchboard plant for the tramways department; British Thomson-Houston Company, Limited, feeder panel, £84; Albion Clay Company, Limited, annual supply of conduits; Underfeed Stoker Company, Limited, patent underfeed stoker, with forced draught fan and motor, £258; Veritys, Limited, motor generator, £52 10s.

**Perth (W.A.) Council** have placed the following contracts: Power-station buildings, complete boiler-house equipment, and other plant, Babcock and Wilcox, Limited, £124,424; turbo-alternators, transformers, and motors, Willans and Robinson, Limited, £30,982; traction rotary converters, British Westinghouse Electric and Manufacturing Company, Limited, £9,863; condensing plant, pumps, and piping, Willans and Robinson, Limited, £23,251.

**Glasgow Tramways Committee** have accepted the following tenders: Sheet mica, Micanite and Insulators Company, Limited; armature binding wire, W. N. Brunton and Sons; scrap, zinc, lead-covered cable, brass turnings and borings, brass dust, copper and mica turnings, dry cells, J. Jackson and Company; scrap lead, brass, copper, motor field coils, armature coils, P. and W. McLellan, Limited; scrap vulcanised rubber cable, Ballardie, Holden, and Company; scrap rubber and motor tyres, City Waste India-Rubber Company; scrap old bagging, George Cunningham; altering superheaters for Pinkston power-station, Babcock and Wilcox, Limited.

**Petrol-Electric Tramcars for Hastings.**—W. A. Stevens, Limited, 26, Victoria Street, London, have received an order from the Hastings and District Tramways Company to fit several of their cars for petrol-electric propulsion as an experiment, with a view to establishing through running from Hastings to Bexhill. If the vehicles are found to run satisfactorily, 20 such cars will be required. Readers will remember that the use of the surface-contact system on two miles of the Hastings sea front has been forbidden by the Board of Trade, whose licence expired on September 6. In order to enable the test of the petrol-electric cars to be satisfactorily carried out, the company have applied to the Board for an extension of the licence, and this application has been supported by the Town Council. Three petrol-electric cars by Messrs. Stevens are now running on the East London lines of the London County Council.

## TRAMWAY AND LIGHT RAILWAY NOTES.

**ABERDEEN.**—The Tramways Committee have adopted a recommendation of Mr. R. S. Pilcher, general manager, that six additional top-covered cars be provided to cope with the increased traffic in the city. Authority has also been given to order Brill trucks.

**BELFAST.**—Indignation has been created by the action of an auditor of the Local Government Board of Ireland in having surcharged three members of the Corporation, who, by their signatures, authorised the payment in May, 1912, of the sum of £2,800 to the tramway employees as a bonus out of the profits of the undertaking. Before adopting the plan the Corporation obtained the opinion of Mr. Stephen Renan, K.C., an eminent member of the Irish Bar, as to the legality of the step, and on his advice the Corporation felt that they were entitled to regard the step as perfectly legal. In recommending the Council to adopt the system, Mr. Nance, the general manager, said he was of opinion that profit-sharing would give the men a stronger interest in their work, increase *esprit de corps*, and promote unity between the Corporation and their tramway employees. It is said that the effect of the surcharge will be that practically every worker in the service of the tramways in receipt of a weekly wage will have his allowance reduced by an average of about 1s. 9d. per week, which will be regarded as a real grievance. The Corporation hold that the bonuses are a perfectly legitimate charge, and that a similar scheme is, in fact, pursued in some Government departments. It is stated that the surcharge will doubtless be the subject of legal proceedings.

**BEXLEY.**—The Council have agreed to a recommendation made by the tramways engineer and manager, Mr. H. P. Stokes, for 15 of the cars to be equipped with trucks of the type selected by him, at a cost of £48 per car. Of this sum £20 has been sanctioned by the Board of Trade as being necessary for the provision of electro-mechanical track brakes. It is estimated that the new trucks will effect a saving in cost of maintenance of trucks (this item at present costs £120 per annum), a saving of at least 10 per cent. in current consumption on the cars, a saving in maintenance of cars and permanent way in consequence of the easier running of the cars, and the scrap value of old material superseded. The question of placing top covers on six cars at a cost of £115 per car has been deferred for three months.

**BURNLEY.**—At the September meeting of the Council complaint was made that in July the tramways earned 11·85d. per car-mile, as against 13·16d. in the same month last year. A member also urged that they had overdone the extra service of cars altogether. Councillor Heap admitted that the figures quoted were correct, but still the Council would notice that the receipts for July were £1,000 more than in July of last year. He was satisfied, along with the manager, that when they found traffic on the road it was a mistake not to try to pick it up. The rule amongst tramway managers, when they get to a revenue of a shilling per car-mile, is to put more cars on. They carried 1,451,313 passengers, as against 1,277,764 in July of last year.

**COVENTRY.**—The Corporation have commenced the extension of the tramway depot at a cost of £20,475. The scheme provides not only for the enlargement of the depot, but also for the provision of new cars, additional cables, and signals. The new car shed will be erected alongside the existing building, and will accommodate 18 cars on six tracks, with inspection trenches. A feature of the depot will be the mess room, with a bathroom, for the employees. Much has lately been done to improve the service, but the undertaking is hampered by the narrow streets, and much of the tramway is only single track. Out of the total length of 14 miles only about two are double tracked.

**DARWEN.**—The Tramways Committee have decided to give a three months' trial from October 1 to a scheme submitted by Mr. F. J. S. Hosken, the manager and engineer, for the issue of a 2d. return ticket on the Bolton Road section, and a 1d. return dinner-hour ticket on all sections between 12 and 1 o'clock on the outward journey, the return portion to be available not later than 2 o'clock.

**DONCASTER.**—The saloon of a new car at Doncaster contains a new type of seat, the invention of Mr. E. S. Rayner, the tramways manager. It rests on legs, and can be tipped back, thus facilitating the cleaning of the floor. The space underneath gives room for

5.258 BRAKES SOLD IN 90 DAYS!

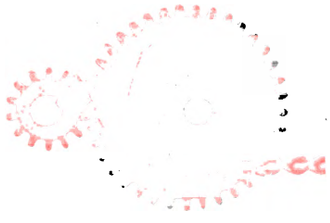
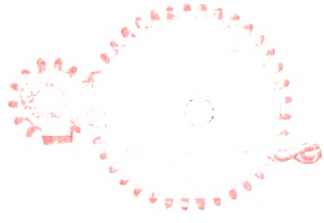
IMPROVED BRAKE

(Patent),

and prevent the drum from over-running on release.



READY TO WIND.



WINDING.

Metropolitan Building,
New York City, August 26, 1913.

J. McI. Cater, Manager,
Peacock Brake Co.,
London, England.

Dear Mr. Cater:

It affords me pleasure and is only fair to inform you that the Peacock Improved Brake, shipped by you from England last Fall, was tested under the supervision of the Public Service Commission of this State, and was awarded the highest percentage for efficiency over all other hand-geared brakes - and, rest assured; they were all there. The outcome of this test resulted in the National Brake Co., of Buffalo, N. Y., immediately purchasing the rights from me to manufacture and sell the Peacock Improved Brake in the United States.

We have thus far only shown it to the companies mentioned below who have purchased the following number of brakes within the last ninety days.

| | |
|---|---|
| The Brooklyn Rapid Transit Co. | 4036 |
| Second Avenue Railway Co. | 550 |
| New York Street Railways Co. | 440 |
| Third Avenue Railway Co. | 102 |
| Belt Line Railway Co. | 80 |
| Manhattan & Queens | 50 |
| Total Number Brakes Sold | 5258 |

To my mind your success in Europe, and the initial sales in the United States, speak well for the future of the Peacock Improved Brake.

Yours sincerely,

For full particulars of the "Peacock" IMPROVED Brake write for new catalogue to

THE "PEACOCK" BRAKE CO., 27, Clements Lane, LONDON, E.C.

Digitized by Google

parcels. Mr. Fearnley, of Sheffield Tramways, has adopted the seat for future use.—A car of unusual length for Doncaster has been introduced into traffic. It seats 74 passengers, the body being mounted on a Peckham radial truck, which passes round curves with greater ease than an ordinary single-truck car, while the latter seats only 52 persons. Six other cars for which an order has been placed will have the Peckham pendulum truck. The makers of the trucks are the Brush Company, while the bodies are the work of the United Electric Car Company.

**GLASGOW.**—For the first quarter of the financial year of the Glasgow Corporation Tramways ended on August 31 the traffic receipts are £19,000 above the corresponding period of last year. The number of passengers carried increased by 6,000,000. At the tramway works new cars are being made at the rate of about 10 each week in an order for 100 vehicles. The department are also busily engaged placing vestibules on the whole stock. Already 300 have been thus dealt with. There are now only some 50 of the old converted horse-drawn cars in the service, and they are used only at times of pressure.

**LEEDS.**—The Tramways and Electricity Committee have arranged to purchase 4,625 square yards of land, at Guiseley, for the purpose of an additional depot and sub-station, at the price of 2s. per yard. £45,000 is to be expended on new cars and installing side life-guards.

**LIVERPOOL.**—By the construction of three new curve junctions, without the addition of any straight line, a new circular and alternative route is to be instituted. This will connect the centre of the city with Netherfield Road and the north docks, forming practically a duplicate track. For the round journey of five miles twopence will be charged. The route will probably be opened before the end of the year, Mr. J. A. Brodie, the engineer, beginning the work as soon as possible.

**MANCHESTER.**—Although hardly more than a third of the people who signed the memorial in favour of the all-night hourly service have made use of the cars, Alderman Bowes, chairman of the Tramways Committee, states that they intend to go on with the facilities for three months, keeping an accurate account of the cost and use. The committee did not expect a profit, but did not want a serious loss.

**NEWCASTLE-ON-TYNE.**—In his annual report Mr. Ernest Hatton, general manager of the tramways, indicates that this year the reserve and renewals fund will be heavily drawn upon, it being imperative to renew considerable lengths of track and several junctions. Additional plant has been provided at the power-station to meet the increasing demand for power. Mr. Hatton says that the undertaking has now reached a stage when renewals must be encountered annually and not occasionally, as in the past. While there was no occasion for doubt and uneasiness as to whether the undertaking could meet these expenses, so long as a firm policy was pursued in resisting all attempts to deplete the net annual revenue by saddling it with still heavier charges than it now carried, on the other hand, if that policy were not pursued, the undertaking might eventually have to be supported out of the rates.—Portions of the permanent way are being renewed with Sandberg rails weighing 110 lb. per yard. To prevent water from finding a lodgment under the rails a packing is being utilised of steel slag broken to 1¼ in. gauge and combined with a pitch mixture. A large number of central standards are being replaced with span wire overhead equipment.

**OLDHAM.**—In connection with track maintenance, the annual report on the Oldham tramways mentions that a number of steel paving blocks have been laid in Union Street for experimental purposes. The net working expenses of the Oldham undertaking per car-mile were 6·084d. as compared with 4·528d. five years ago. Maintenance and equipment were more costly than a few years ago, being 2·11d. per car-mile.

**SHEFFIELD.**—The "Tudorweld" is being applied to rails which are worn at the joints, but which are otherwise in a good condition. The welding of rails by other processes has been carried on in Sheffield during the last three years, and although many of the welds were done during the hot summer of two years ago, and there are now some thousands of welded joints in use, there has not been a single breakage.

**SOUTH YORKSHIRE.**—Wath, Bolton, Wombwell, and Thurnscoe Councils are combining in the consideration of a joint municipal tramway scheme, with possibilities of extension in the direction of Mexborough and Barnsley. Mr. J. L. Hawksworth, clerk to the Bolton-upon-Dearne Council, has been appointed clerk to the joint authorities. In connection with the scheme, Messrs. Bury and Walkers have been appointed solicitors. A well-known Westminster engineer is acting as adviser to the authorities.

**STIRLING.**—The Town Council on September 16 received a letter from Mr. G. Balfour, of Messrs. Balfour, Beatty, and Company, regarding his proposals for the electrification of the tramways. He was prepared to pay the sum of £28,642 for the electricity undertaking to cover the unredeemed debt on the undertaking, an additional sum of £2,250 to refund the Council the difference in accumulated debit balances, accumulated up to the year 1908, and the credit balances carried to reserve since that date; and, in addition, a sum in cash of £2,000, making a total of £32,892. Mr. Balfour also promised a reduction in the charges for current. The matter was adjourned for consideration.

## PATENT LIST.

**Specially abstracted for "The Tramway and Railway World" from the Official Journal of Patents.**

*** If the inventions have been communicated the names of the communicators are given below in italics.

### APPLICATIONS.

Applications for Letters Patent have been filed:

19,218 Life-guards for motor omnibuses—P. C. Sarapata.
19,289 Apparatus for preventing the derailing of locomotives—W. H. Pickles.
19,303 Hanger-straps for interior of tramcars, motor omnibuses, etc.—J. Whitehead, sen., and H. J. Whitehead, jun.
19,334 Superheaters—H. A. Stenning and Schmidt Superheating Company (1910), Limited.
19,414 Tramcar seat—H. Barrow.
19,528 Reversible seats for tramcars, etc.—J. W. P. Page.
19,585 Car trucks—M. E. Curwen (*J. G. Brill Company*).
19,586 Life-guard for motor omnibuses—G. Norris.
19,603 Insulative rail joints—B. R. Wills and J. C. Sykes.
19,640 Electric railways—A. L. Simon.
19,691 Seats for tramcars, motor omnibuses, etc.—A. L. Barber.
19,702 Seat cover for omnibuses and tramcars—W. J. Hickman.
19,842 Automatic brake adjuster for tramway vehicles—E. Peckham and S. Thomas.
19,935 Brake blocks—E. C. Harmes.
20,025 Construction of omnibuses, tramcars, etc.—C. F. Newman.
20,045 Rail and road vehicles—C. W. Mallins.
20,046 Rail and road vehicles—C. W. Mallins.
20,062 Automatic seat cover for motor omnibuses—J. M. Walsh.
20,125 Route indicators—P. Bobichon.
20,127 Car trucks—H. H. Hewitt.
20,149 Life-saving device for omnibuses and tramcars—P. Berry.
20,284 Trolley poles—C. C. Wallace and C. A. Macey.
20,296 Brake shoes—W. C. Fisher.
20,436 Rail joints—E. A. Byrde.
20,494 Guard for motor omnibuses—F. Tanner.

19,851 Elevated suspension railways—Paelman.
19,852 Cars for elevated railways of the suspension type—Paelman.
19,887 Track sanders for tramcars—Carroll, Chilton, Brown and Edmiston.
20,275 Fixing of rails on permanent way—Henry.
21,507 Detonator apparatus for signalling on railways—Hosker.
26,344 Electric railway systems—Purvis and Gritman.

1913.

2,377 Sanding apparatus for power-driven vehicles—Douglass.
9,778 Rail joints—Yordon.
14,002 Fluid-pressure braking and rail-sanding apparatus—Turner.
4,190 Automatic signal system for railways—Perry.
5,464 Railway sleepers and fastening for rails—Baughman.
9,066 Braking contrivances for tramcars—Van der Straeten.
10,063 Railway signalling—Tarrant and Sykes.
374 Railway sleepers—McLean.
7,535 Car journal boxes—Berry.
14,001 Fluid-pressure brakes—Turner and Donovan.
14,155 Means for uniting adjacent ends of railway rails—Wentz.
16,920 Railway signals—Stockdale.

## DICK, KERR AND COMPANY, LIMITED.

The annual meeting of this company was held in Cannon Street Hotel, London, on October 9, Mr. Claud T. Cayley presiding.

The Chairman, in moving the adoption of the directors' report (a summary of which appears among our financial paragraphs), said he was glad to be able to meet the shareholders with a better showing of results than was the case last year, although they were not yet in the position in which they would all like to be. In a business such as theirs, with interests in many varied branches and all over the world, he would be a bold man who predicted results in advance, especially in view of the labour, financial, and political complications existing at the present time. In the balance sheet the item of "capital expenditure at the works, including goodwill and patents," showed a reduction of over £7,000, which represented the amount by which the depreciation exceeded the additional capital expenditure for the year. No doubt they would regard that as a satisfactory feature in the accounts. Although they had been obliged to face a considerable diminution in their profits in recent times, the directors had consistently adhered to what they believed to be a sound and conservative policy in regard to depreciation at the works. Then "stocks on hand and work in progress," which referred only to the manufacturing side of the business, showed an increase of £31,000 over last year. This was the high-water mark on this account in the history of the company, and it might be regarded as a favourable sign. Taking the "debtors," "bills receivable," and the outstanding balances on contracts together, these assets had increased to the extent of £71,753 as compared with last year. Turning to the liabilities side the only change of importance was the "loan from bankers, £100,000." In order to arrive at an explanation they must look at the other floating liabilities, and they would see that the creditors, bills payable, and loans (other than bankers' loans) showed an increase of about £12,500 on last year, as against the increase of £71,753 in the corresponding assets on the other side—namely, debtors, bills receivable, and contract balances. There was, therefore, a net increase of assets over liabilities on these accounts of nearly £60,000. Then they had to take into consideration the increase in the value of their stocks and work in progress—namely, £31,000. The demand for extra working capital was the result of expansion in their manufacturing branches. He knew of no branch of the heavy engineering trades in which the custom in respect to payments was so severe. They were extremely busy in the works; in fact, they had never had more work than at the present time, and he hoped and believed that it would prove to be more satisfactory work than they had had for a very long time. With such a large amount of work in hand and under contract the weekly expenditure in wages and material was very large, and a large amount of capital was consequently locked up. The board considered that the business as a whole was most satisfactory.

Mr. R. H. Prestwich seconded the motion.

The Chairman, replying to questions, said that the item of capital expenditure at the works, including goodwill and patents, £611,393, £226,000 represented goodwill and patents. The directors of the company probably held one-half of the ordinary share capital, and they regretted extremely the fact that they were not receiving a dividend. As a result of hard work, they had succeeded in increasing the profit from £2,000 or £3,000 last year to nearly £30,000 this year, and if the ordinary shareholders exercised patience he hoped that some day they would be able to pay them a dividend. The report was adopted.

### TRAMWAY DIRECTORIES.

A useful feature of this issue is the directory of electric railways and electric tramways which will be found among the advertising pages. This directory contains the names of the chief officals and the principal particulars relating to each undertaking.

The directory is revised as occasion requires, and is the most up-to-date and comprehensive list published.

Now that the Development Commissioners have been more than three years in office and have made no progress with one of the most important enterprises for which the Commission was established—the improvement of rural transport—the suggestion might be put forward that that portion of their task should be allotted to the Light Railway Commissioners, whose powers should be widened so as to include railless mechanical road vehicles. The blame for the three fruitless years rests upon the Chancellor of the Exchequer. Although when he introduced the Development and Road Improvement Act, 1909, Mr. Lloyd George was profuse in acknowledging the need for improved means of rural transport, he imposed a restriction that has prevented any progress being made. The Commissioners admit that much, not only in regard to transport but to afforestation, land drainage and reclamation, and the improvement of inland navigation. The fatal blemish is that no advances can be legally made to individuals or companies trading for profit. This obstacle, however, may not in some quarters be deemed a sufficient excuse for the Commissioners allowing their third year of office to arrive before taking steps to examine one of the main questions in relation to transport, namely, the relative merits of light railways and the various forms of motor transport by road. During the past year only three applications were received, one relating to the establishment of a motor car service and two for light railways. Before giving their decisions on the applications the Commissioners appointed Mr. G. A. Burls, an engineer familiar with commercial motor transport, and formerly of J. I Thornycroft, Limited, to report in a specific case on the relative merits, particularly from a financial point of view, of light railways and motor transport, but his report had not been received by the end of the year. It is improbable that the contents will be made public, though its importance is enhanced by the statement in the Commissioners' report that they have reason to think that important schemes are likely to be brought forward shortly. This statement no doubt has reference to the steps that have been taken in Aberdeenshire, Banff, and Kincardine to form a Development Association in order to meet the defect in the Act and to promote light railways with the aid of one of the principal railway companies.

---

In their present report the Development Commissioners urge that the difficulty might be to some extent overcome by the formation of national associations (not trading for profit) to receive and administer advances from the fund. Furthermore, they feel that the position ought not to be left unaltered without an effort to change it. Perhaps the best and most speedy remedy would be for the Government to hand over the transport work to the authority who are acquainted with the light railway side of it, and also to amend the Act in the direction of allowing grants to be made to companies already in existence or which might be formed. The amount of the grants allotted to the Commissioners for five years appears to be £2,900,000, and up to March 31 last the sum of £725,988 had been advanced to enterprises other than transport schemes. With a reasonable amendment of the Act, there ought to be no more illegality in assisting company projects than is the case when local authorities agree to pay an annual sum to another authority or company for an extension of tramways to their districts, or to recoup a loss on the working. The latest example of this is to be seen in the recommendation of the Finance Committee of Kidderminster Town Council, to make good any deficiency up to £200 on a motor omnibus service, proposed to be instituted at a cost of £4,000 by the Kidderminster and Stourport Tramways Company, for one year between the former town and Bewdley. There are to be cheap fares for workpeople, and the Council are not to grant facilities to anyone else in respect to a service of motor omnibuses in the borough. Various points were raised when the matter was discussed by the Council, and these are to be reported upon by the Committee. Probably the failure two years ago of five Irish Councils to secure aid from the Development Board for the establishment of motor services and for improving light railways built under the Tramways (Ireland) Act, 1883, was responsible for only three applications having since been received from local authorities in Great Britain. Before making loans the Development Board require a local contribution to be forthcoming of a reasonable proportion of the capital sum required, and full provision must be made for putting in order (where necessary) and for maintaining the roads upon which the motor service is to be run. This latter requirement should not be difficult to satisfy in view of the aid that ought to be forthcoming from the Road Board. Provided that battery vehicles can be run as cheaply as petrol machines, the advisability of directing attention to the Development Commission's powers might be considered by the Electric Vehicle Committee recently formed by the Municipal Electrical Association.

# MOTOR TRAFFIC.

Commendation is due to the Army Council for making a new departure by advertising the institution of the subsidies of £110 to owners of petrol motor vehicles carrying 3-ton and 30-cwt. loads exclusive of heavy bodies, provided their prototypes have passed the official trials. The adoption of this method of publicity has been urged for some time, not only in the interest of the nation but of those manufacturers who have constructed such vehicles and passed the tests, in which the chassis has borne loads of 4 tons 10 cwts. and 2 tons 10 cwts. respectively. In return for the subsidy the owners contract to place their machines at the disposal of the Army in case of a national emergency, but not on the occasions of manœuvres. For the latter work a scheme of registration is in force under which a miscellaneous collection of wagons and lorries is utilised with their drivers. Under the subsidy scheme practically any type of body allowing of end loading is accepted, and a commendable feature of the advertisement announcing the subsidy is an invitation to owners to write and explain their difficulties in order to see if they can be met in the event of the subsidy type conveyances not appearing to meet their requirements. By this means it is possible that the scheme will be made to fulfil its purpose more thoroughly than would otherwise be the case. If, instead of announcing that a list of makers who have obtained the subsidy certificate can be supplied on application, the War Office were to advertise the names and addresses of those firms the department would be doing no more than justice to the manufacturers, for they have incurred considerable expense to produce vehicles suited to military requirements, besides the cost of trials extending over 21 days. To make good the foregoing shortcoming on the part of the Mechanical Transport Committee at Whitehall, we may mention that the first makers to pass the trials were Leyland Motors, Limited, whose success was achieved about a year ago. In the first month of the current year J. and E. Hall, Limited, and J. I. Thornycroft and Company, Limited, were added to the list. How much more advantageous motor traction proves compared to horses or heavy traction engines is shown by the average speeds in the trials on hilly and heavy roads exceeding 10 miles an hour, the highest average speed recorded being 12 miles per hour on main roads in a heavy condition, while the fuel consumption was considered to be as good as the standard specified.

---

For the third series of trials, which are taking place this month, and also in November, the entrants are more numerous than on previous occasions, thus showing that the small entries received hitherto have not been due to anything fundamentally objectionable in the regulations. The new aspirants are Clayton and Company, Limited, Dennis Brothers, Limited, Maudslay Motor Company, Limited, Walker Brothers, Limited, and the Wolseley Tool and Motor Car Company, Limited, their vehicles all being of the 3-ton class, but the Wolseley Company will also run a 30-cwt. chassis. The Lacre Motor Car Company have entered an engine made by W. H. Dorman and Company in order to test its suitability for use in subsidised vehicles. That the scheme is increasingly claiming the attention it deserves is shown by the announcement that the War Office have passed the designs for a number of other vehicles, which cannot be completed in time for the present trials, and that the fourth series of trials will be arranged for the spring of next year. That the subvention type of vehicle is suited for civil work in this country as well as for the Colonies was made evident by the examples staged at the recent exhibition at Olympia, but in view of the suggestions put forward in the course of the papers submitted to the Imperial Motor Transport Conference, the War Office might now consider if their specifications cannot be improved, either by instituting a class for chain-driven vehicles or by adopting some of the pointed suggestions put forward by Mr. Hamilton Grapes, an engineer whose public service and commercial motor vehicle work for ten years in Australia should enable him to speak with some authority regarding the design of vehicles, whether for commerce or military work overseas. It is mainly in countries other than Great Britain that the type will be required for service with an expeditionary force. As the result of the experience gained at this year's army manœuvres it will not be surprising if the authorities give consideration to the question of supplanting some of the horsed regimental transport and cooks' carts with motor vehicles. This year's operations proved so severe a test that the horsed transport did not perform its portion of the work of taking supplies to 40,000 men and 13,000 horses altogether satisfactorily, after receiving them from the hired motor transport, which brought the food for distances of 40 miles and upwards from the rail head. By a system of grouping regimental units it should be possible to keep motor vehicles fully employed all the year round, and if provision were made for the proper training of Army Service Corps officers and regimental quartermasters in the maintenance of motor vehicles, there would be a better guarantee that the new equipment would be intelligently and carefully handled. At present the War Office, on account of financial considerations, is proceeding very cautiously in providing motors for the A.S.C., but the increasing dearth of horses which is experienced each year, combined with the experience gained at the manœuvres, may lead to an announcement of great interest to commercial motor vehicle makers when the Army estimates are introduced next year.

## STOPPING PLACES OF CARS AND 'BUSES.

### An Admirable Arrangement in West Ham.

Representatives of the West Ham Corporation Tramways Committee, and of the London General Omnibus Company, have met and agreed to a list of places at which the tramcars and omnibuses shall respectively stop, thus doing away with the danger to the public which exists while the two classes of vehicle use the same stopping places. Acting upon this agreement between the two parties, Sir E. Henry has decided to embody the arrangement into regulations to be observed by all tramcars and omnibuses running through West Ham.

### Agreed By-Laws for Glasgow.

In consequence of complaints made against motorists in Glasgow of endangering persons entering and leaving tramcars, a conference has been held between the Magistrates' Committee of the Corporation and representatives of the Scottish Automobile Club. As the result two by-laws have been agreed to, subject to the approval of the Corporation and confirmation by the sheriff, under which every driver of a vehicle when passing a tramcar proceeding in the same direction is to pass on the left or near side, except in cases of sufficient reason for deviation. When a tramcar is standing at a stopping-place, every driver of a vehicle who intends to pass on the left or near side of such car is to draw up immediately before arriving at such stopping-place, until the roadway is clear of passengers entering or leaving a car.

## AVELING WEATHER SCREENS.

The three illustrations on this page show the Aveling patent weather screen in use, both open and closed, on a Daimler omnibus belonging to the Birmingham Corporation Tramways department, and on an

Aveling Weather Screen Fitted to L. & N. W. 'Bus.

omnibus belonging to the London and North Western Railway Company. As the result of a trial of the invention, Mr. Alfred Baker, the general manager, has given an order for the supply of similar

Aveling Weather Screen—Open.

Aveling Weather Screen—Closed.

screens for the whole of the omnibuses of the Corporation. The makers are Messrs. T. C. Aveling and Company, Limited, New Canal Street, Birmingham.

## "THE UNOFFENDING OMNIBUS."

London Coroner's Suggestion for Preventing Accidents.

Mr. S. I. Oddie, coroner for Westminster, has put forward a suggestion for preventing accidents caused by motor omnibuses in the city of Westminster, which extends roughly from the Thames on the south to Oxford Street in the north, and from Kensington Palace in the west to Chancery Lane in the east. Here are to be found most of the taxi cabs, the large motor cars, and the motor omnibuses. Here also are the crowds of shoppers, the theatre goers, and the country and foreign visitors, but there are practically no tramcars.

"As coroner for Westminster," Mr. Oddie says, "my experience of fatal accidents in this area has led me to the conclusion that a considerable saving of life might be effected in a very simple manner. A common cause of fatal accidents is to be found in the overtaking of one swift vehicle by another at crossings provided at dangerous points for the safety of foot passengers. Take the case of a pedestrian who leaves the pavement at such a place to cross to a refuge in front of an advancing motor omnibus. He would be perfectly safe from the omnibus, but he finds, when he has crossed in front of it, that a taxi cab or motor car is overtaking the 'bus on its off side. He is now in a perilous position. He has no time to go forward and reach the refuge, and perforce he steps back to avoid the taxi cab and is knocked down by the unoffending omnibus.

"If a certain number of the principal crossings and refuges were marked by a distinctive sign or colour, and if no overtaking of one vehicle by another were allowed at such crossings, I feel confident that many lives would thereby be saved. Another suggestion that occurs to me is that at certain bewildering crossings, such as Trafalgar Square, there should be a refuge between all lines of traffic proceeding in opposite directions. The effect of this would be that the pedestrian, as he passes between pavement and refuge, or refuge and refuge, would only have to look out for and to deal with one line of traffic at a time."

## RAILLESS TROLLEY CAR v. MOTOR 'BUS.

Before putting into operation the powers which they acquired last year to install a railless trolley car system and to run motor omnibuses, the Hove Town Council have decided to acquire the fullest information regarding the two methods of traction. For this purpose two members of the Corporation and Mr. H. H. Scott, borough engineer, have visited various railless trolley installations in England and also received reports from experts in motor omnibus traction. In his report Mr. Scott points out the difficulty of instituting a reliable comparison between the cost of working the two kinds of 'buses, as local conditions play an important part in the calculation. He is inclined to take the operating cost of trolley 'buses at 7d. per mile, and for motor 'buses as applicable to Hove at 9d. per mile. In speed the vehicles were about equal, and the wear in roads might be the same in each, but the trolley 'bus would run in the same groove. The motor 'bus would not be rated, except on the assessment for the buildings and garage connected with the undertaking. In this respect it differs from the trolley 'bus, which, he assumes, would be assessed on similar methods to tramways—*i.e.*, on its revenue-earning capacity. In considering the 2d. per mile extra cost of the motor vehicle, it must be remembered that charges for interest and sinking fund would be lower by reason of the absence of capital expenditure upon overhead equipment, which might make a difference of from 0·25d. to 0 5d. per car-mile, according to the number of vehicles in the service. Taking the 2d. as a basis of calculation, it is estimated that on a fleet of 25 'buses running an average of 100 miles per day during 300 days of the year, the cost would be an extra £6,250 per annum for motor 'buses as compared with trolley vehicles. Notwithstanding the difference in cost of running in favour of the trolley vehicle, he suggests for consideration whether in the event of the Town Council deciding to proceed with the matter at once, it would not be wise to limit the erection of overhead wires to the routes set out in Clause 16 of the Hove Corporation Act, 1912, leaving the other routes named in the Act to be dealt with as experience may determine.

## INTERNAL COMBUSTION ENGINES APPLIED TO RAILWAYS.

In a paper on the above subject before the Engineering Section of the British Association meeting on September 12, Mr. F. W. Lanchester discussed various systems by which the internal combustion engine was applied to railway traction, and by process of elimination the author deduced that for the conditions of British railways, at least, the most promising solution was found in a straightforward piece of engineering, in which all the main elements, the petrol motor, the gear box, the jointed transmission shaft, and the right-angle drive, also the auxiliary electrical equipment, were taken *mutatis mutandis* from motor car practice. The paper described a recent development of the self-propelled railway coach in the form of a vehicle built by the Metropolitan Wagon Company and equipped with its power installation by the Daimler Company. The general lines of the coach—a 60 ft. bogie—were described, and the installation was given as being furnished in duplicate, each power unit comprising a 6-cylinder sleeve-valve Daimler engine of 6 in. bore and 6 in. stroke, a triple-tandem 6-speed epicyclic gear box, in which the speeds are grouped as three low-gear ratios, whose function is mainly in starting and giving high acceleration, and three high-gear ratios, which are exclusively used for running at speed. The whole of the gears are actuated by clutches of the magnetic type. The right-angle transmission is fitted to a prolongation of one of the bogie axles, and consists of a bevel drive, in which the pinion on the tail shaft gears simultaneously into two crown wheels on the axle, an alternative dog clutch being arranged to bring one or the other into positive connection. By this means the reversal of the car is effected. The two units are disposed symmetrically on opposite sides of the vehicle, and drive on to opposite ends, so that the job is entirely symmetrical. The vehicle can be controlled from either end. The electrical equipment consists of dynamos coupled direct to the tail ends of the respective engine crank shafts and an accumulator battery, and serves both for starting the engines and for lighting purposes and driving an electric air compressor to operate the air brake.

In a brief discussion, Professor H. S. Hele-Shaw described his system of hydraulic transmission, which has been applied to a motor coach now in operation in America, and suggested that the future developments upon the lines indicated by Mr. Lanchester would lie between these two systems.

## INSTITUTION OF AUTOMOBILE ENGINEERS.

The new session commenced on October 8, when Mr. J. S. Critchley gave his presidential address, in which he dealt broadly with the whole subject of fuel for internal combustion engines. The presentation of the Crompton Medal of the Institution was made to each of the past presidents, by the retiring president.

The ordinary monthly meetings will be held as usual at the Institution of Mechanical Engineers, on the following dates: November 12, December 10, January 14, 1914, February 11, March 11, April 8, May 13, and among the authors will be: Dr. W. R. Ormandy, Mr. A. Ludlow Clayden, Mr. A. E. Bennett, Prof. J. Goodman, Mr. F. W. Lanchester, Mr. H. E. Wimperis, and Dr. E. G. Acheson. It is probable that the subjects to be dealt with will include the following: Results of Tests on Alcohol, The Economics of Design, Balancing, Commercial Vehicles, Lubrication, Ignition Magnetos, Accelerometer Tests, and a lecture on Bearings. Mr. Basil H. Joy, the secretary, informs us that a register is kept at the Institution of members who are seeking employment, and enquiries for those who are seeking for men to fill vacancies will be welcomed.

It is hoped that a paper will be read at the November meeting of the Institution embodying the result of the observations of the various members of the party who visited America this summer, and it is expected that a number of members of the American Society of Automobile Engineers, who will be in London on a visit to the Motor Show, will be present at that meeting to take part in the discussion. It is also hoped that as a result of the interchange of ideas a number of members of the S.A.E. will join this Institution also.

The Birmingham and Coventry Branches of the Institution have now been definitely amalgamated under the title of the Midland Centre.

NEW USE FOR MOTOR OMNIBUSES.—During the recent army manœuvres in France a number of motor omnibuses were utilised as meat vans. The windows and door were removed and wire gauze substituted. The seats were also taken out and meat hooks were affixed to the roof.

## LECTURES TO COMMERCIAL MOTOR DRIVERS.

With a view to giving drivers of commercial motor vehicles an opportunity of improving their knowledge of the construction and working of commercial motors, the Commercial Motor Users' Association has made arrangements for Mr. G. W. Watson to deliver a series of lectures to drivers in the employ of members. The lectures will be given at the Royal Automobile Club, Pall Mall, London, S.W., from 8 to 9 p.m., on alternate Wednesdays in the months of October, November, December, and January, and commenced on October 8. In order to prevent overcrowding of the lecture hall, a registration fee of 1/- per driver is being charged. Application for lecture membership should be made to Mr. F. G. Bristow, secretary, 89, Pall Mall.

## AN ALBION MOTOR TOWER WAGON.

Subjoined is an illustration of a motor tower wagon recently supplied to the Doncaster Corporation tramways department by the Albion Motor Car Company, Limited, Scotstoun, Glasgow. The engines

develop 32 H.P., and as the chassis is designed for only two tons, the vehicle in an emergency can be driven to the place where it is required at a speed as high as is reasonable with solid rubber tyres.

## PARAFFIN FUEL FOR COMMERCIAL VEHICLES.

Mention was made at the first annual meeting of the G.C. Vaporiser, held at Winchester House, London, E.C., by Mr. N. O. Walker, the chairman, that although there were other carburettors on the market, he believed that there were none doing the work so well as the G.C. vaporiser, and, indeed, if there were one or two other successful vaporisers or carburettors, instead of injuring this company, it would, in his opinion, help it, because it would show that the public were getting over their prejudice. In a War Office trial for lorries using paraffin their vaporiser was the only one submitted for trial, though others were entered. This vehicle ran on any paraffin the War Office choose to supply, and at the end of the trial Messrs. Pickford, whose van was used, were informed that the War Office were agreeable for the subsidised vehicles to be fitted with this device.

COVENTRY'S PURCHASE OF OMNIBUSES.—Coventry Corporation, on the advice of the Tramways Committee, have purchased six motor omnibuses at a cost of £4,434 from the Maudslay Motor Company, Coventry.

Digitized by Google

# MOTOR TRAFFIC.

## WAR OFFICE SUBSIDY TRIALS.

The fourth trial of petrol lorries under the War Office subsidy scheme is now in progress, the entrants being Clayton and Company, Limited; Dennis Brothers (1913), Limited; Maudslay Motor Company, Limited; Walker Brothers, Limited; and the Wolseley Tool and Motor Car Company, Limited. Their vehicles are of the 3-ton type, and the Wolseley Company have also entered a 30-cwt. vehicle. The Lacre Motor Car Company, Limited, have submitted a Dorman engine, as manufactured by W. H. Dorman and Company, Limited. The preliminary examination of vehicles on the road and in the neighbourhood of the entrants' works commenced on September 15, and between that date and October 8 runs at the rate of 200 miles per week took place in the neighbourhood of the entrants' works, though not under War Department observation. On October 8 the vehicles were presented for examination and weighing at the Army Service Corps training establishment at Aldershot. During 21 days in October and November the vehicles are being tested on five main and two hilly routes at Aldershot, and four main and seven hilly routes at Woolwich. The route between the two places named will be traversed twice, and the last running day on November 3 is set aside for a Brooklands speed trial or a 100 miles run over a special route. Finally, the machines will be examined as to their condition.

As a result of the trials of subsidy type vehicles, held in January last over roads in southern counties, the War Department certificate, enabling vehicles built entirely to the same design to be subsidised under the provisions of the subsidy scheme for petrol-driven motor lorries, has been awarded to the following firms: J. and E. Hall, Limited, London and Dartford, and J. I. Thornycroft and Company, Limited, London and Basingstoke.

Owing to the weather and road conditions, the test was a severe one. Both of the certificated vehicles were entered in Class "A" to carry a load of 3 tons, exclusive of heavy body. The actual load carried on the chassis throughout the trial was in each case 4 tons 10 cwts. The certified chassis weights, with all fuel and water on board, and including lamps and acetylene generator, are: Hall, not exceeding 3 tons 2 cwts.; Thornycroft, not exceeding 2 tons 19 cwts.

Certificates for both Class "A" and Class "B" vehicles have already been granted to Leyland Motors, Limited, Leyland, as the result of previous trials. Appended is a table showing the averages of the daily results obtained by all competitors:

AVERAGE RESULTS OF ALL COMPETITORS.

| Date. | Route. | Class of Road. | Condition of Roads. | Average Speed. M.P.H. | Fuel Consumption. Gross Ton-miles per Gallon. |
|---|---|---|---|---|---|
| Jan. 10 | A | Main | Very fair | 11·5 | |
| „ 11 | D | „ | Heavy | 11·8 | 41·4 |
| „ 13 | E | Hilly | Very good | 11·8 | |
| „ 14 | J | „ | Fair | 11·3 | 43 |
| „ 15 | B | Main | „ | about 12 | |
| „ 16 | C | „ | Good | „ 12 | 49·1 |
| „ 17 | To Woolwich | Hilly | Very fair | 11·3 | |
| „ 18 | T | „ | Heavy | 10·5 | 40·5 |
| „ 20 | L & N | Main | Wet and heavy | 11·7 | |
| „ 21 | L & M | „ | Good | about 12 | 46·5 |
| „ 22 | U | Hilly | „ | 10·9 | |
| „ 23 | V | „ | Fair | 10·1 | 42·3 |
| „ 24 | L & O | Main | Very fair | about 12 | |
| „ 25 | P | „ | Heavy | „ 12 | 50 |
| „ 27 | U | Hilly | Good | 11·3 | |
| „ 28 | T | „ | Very fair | 10·9 | 43·7 |
| „ 29 | U | „ | Heavy | 10·9 | |
| „ 30 | V | „ | „ | 10·5 | 40·7 |
| „ 31 | To Aldershot | „ | Good | 11·2 | |
| Feb. 1 | D | Main | Heavy | about 12 | 43·2 |
| „ 3 | E | Hilly | „ | 10·2 | |
| „ 4 | J | „ | Very fair | 10·9 | 40·5 |

The fuel consumption was considered to be at least as good as the standard specified, namely, 50 g.t.m. per gallon under normal road conditions, when the heavy state of the roads is taken into consideration.

LOCAL AUTHORITIES AND ROAD MAINTENANCE.—The Executive Committee appointed at a recent conference at Guildhall of local and road authorities in the Metropolitan Police area on the subject of the motor omnibus traffic met again at the Mansion House on September 30. The Lord Mayor presided. It was decided to prepare statistics in regard to the contributions which, it was suggested, should be paid to the highway authorities by the Road Board to cover the cost of the reconstruction of roadways caused by the increased wear and tear and damage set up by the motor omnibuses. When these and other details have been collated, the Prime Minister will be invited to receive a deputation and hear the views of the authorities.

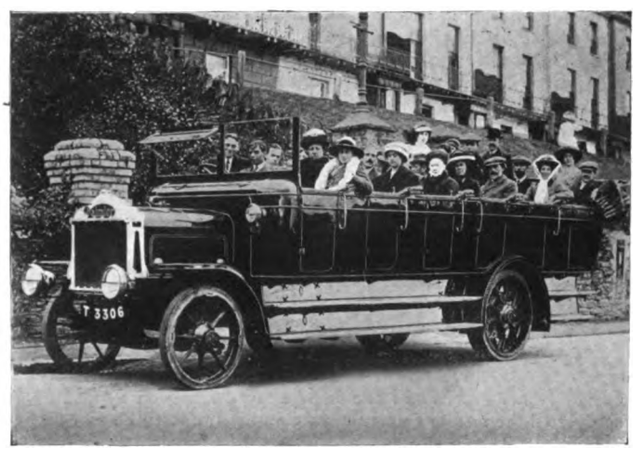
## OMNIBUSES FOR COLONIAL USE.

A report on the question of using motor omnibuses as feeders to the tramways has been presented to the Pretoria Council by the tramways manager. The cost of two vehicles, with spare parts, is put at £2,400, and with one on the road and one in reserve the total cost is given as £260 per month. The manager also considers that the motor omnibuses would be useful in testing routes suggested for tramway extensions. The Tramways Committee recommended the Council to purchase two vehicles.

Wellington (New Zealand) Council have authorised the Tramways Board to purchase three motor omnibuses as feeders to the tramways. The Board will present an estimate of the cost before purchasing the vehicles.

## DAIMLER TOURING CHARS-A-BANC.

The accompanying photograph shows the 40-H.P. Daimler chars-a-banc in use by Autocars, Ilfracombe, Limited, for touring purposes. Several long-distance journeys are made during each week, one being across Dartmoor—a tour of 157 miles through Torrington, Okehampton, Tavistock, Princetown, and Moreton Hampstead. Another is



from Ilfracombe to Bude in Cornwall, a distance of 112 miles. An average distance of 500 miles per week has been run, and the vehicle is giving the greatest satisfaction.

EFFECT OF TRAFFIC COMPETITION ON LONDON RATES.—At the last meeting of the London County Council before the summer recess, Mr. J. D. Gilbert asked the chairman of the Local Government Committee whether he could state (1) how many assessment appeals had been made against Borough Council valuations of tramway tracks for rating; (2) could he inform the Council if railway companies were also appealing against their local assessments on account of loss of revenue owing to motor 'bus competition; (3) would not the effect of the Council's and railway companies' appeals, if successful, be to increase considerably the rates of Borough Councils; (4) was it possible to give the Council any illustration of what any one Borough Council would lose over the reduction of tramway and railway rates, and what increase there would be owing to increased road charges? Mr. E. L. Meinhertzhagen (chairman of the committee) replied that no appeals had yet been lodged, but objections to the assessment of the Council's tramway lines had been served in 23 boroughs. He understood that at least one railway company was objecting to its assessments, on account of reduced revenue owing to motor 'bus and tramway competition. Any considerable reduction of assessment must necessarily result in an increase in the rates. The loss would not fall eventually wholly upon the borough in which the reduction took place, but would be shared partly by the whole of London. There was one case which he hoped had been settled with a certain Borough Council, though it was not finally settled. The reduction in that case would probably involve an increase in the rates of the first year of less than one-third of a penny in the pound, which would be reduced in subsequent years to about a farthing.

A PETROL TRAMCAR IN SCOTLAND.—The Lanarkshire Motor Company, of Glasgow, have fitted a tramcar with a petrol engine for the Stirling and Bridge of Allan Tramway Company.

# MOTOR TRAFFIC.

## MOTOR TRAFFIC NOTES.

AN INQUIRY FROM GOLCAR.—The Urban Council of Golcar have decided to obtain particulars as to the cost of running single-deck omnibuses similar to those at Halifax.

LANCASTER COUNCIL'S ENTERPRISE.—Parliamentary powers are to be sought to enable the Council to provide and run motor omnibuses. Six vehicles are being purchased for £2,600.

FROM MANCHESTER TO CENTRAL CHESHIRE.—Motor vehicles are to take the place of the horse 'bus service between Cheadle and South Manchester, linking up Handforth, Wilmslow, Alderley, and Macclesfield.

LICENSING OF MOTOR OMNIBUSES.—The Gravesend and Northfield Electric Tramways, Limited, have been fined a nominal sum at the instance of the Dartford Urban Council, for plying for hire with two motor 'buses between Gravesend and Dartford without licences.

CREWE MUNICIPAL OMNIBUS SCHEME.—A sub-committee of the Crewe Town Council has been appointed to consider the matter of applying for powers to enable the Corporation to provide and own omnibuses. A draft of the proposed bill has been prepared by the Town Clerk.

LINCOLN'S REQUIREMENTS.—The Electricity Committee of the City Council have been in negotiation with two firms in regard to supplying motor 'buses in the city, but have failed to arrive at an arrangement. The chairman of the committee stated on October 7 that it was possible the Corporation might themselves establish a service.

QUESTION OF TRAMWAY EXTENSION AT DURBAN.—The Mayor of Durban, in referring to the deferred decision of the Council in regard to a proposed important extension of tramways, said that recent developments appeared to him to indicate that motor and electric 'buses would ere long supplant the tramcar equipment.

AN OXFORD PETITION FOR MOTOR OMNIBUSES.—Residents of Banbury Road have petitioned the Council against the proposal to adopt overhead tramways in that thoroughfare, and to substitute either motor omnibuses, which the Corporation have approved of for Woodstock Road, or petrol-driven tramcars, which have been selected for High Street.

MOTOR WAGON COMPETITION WITH CANALS.—Bearing in mind the competition of motor wagons the chairman of the Leeds and Liverpool Canal, in his remarks at the half-yearly meeting on September 19, considered the result of the past six months' traffic to be satisfactory. Taking a series of 10 consecutive half-years, the average receipts were slightly in excess of the past half-year.

MOTOR SPIRIT FROM PEAT.—It is claimed for a new invention known as the Del Monte process that Irish peat can be made to yield a high percentage of oil, the residue being a high-grade coke. Other by-products include sulphate of ammonia. It is stated that recent tests yielded an even average of 40 gallons of oil per ton of dry peat, the quality being so high that 20 gallons of motor spirit was obtainable from it.

RAILWAYS AND ROAD MOTOR WAGONS.—The Great Western Company have for some time past, in different parts of the country, been utilising and are still experimenting with various types of motors in the delivery and collection of traffic carried by goods train. The results are being examined carefully in order to ascertain the advantages derived over horse traction. Two 5-ton Maudslay cars are working between Paddington goods station and the London docks.

CROYDON COUNCIL DEMAND TRAFFIC LEGISLATION.—On September 22 Croydon Corporation passed a resolution urging the Government speedily to legislate upon the lines of the recommendations of the Select Committee on Motor Traffic, owing to the dangerous and congested state of the streets, the serious accidents and loss of life, through the influx of 'buses. It was stated that five persons have been killed in Croydon this year by these vehicles, but none by tramcars.

A POSSIBLE OPENING FOR OMNIBUSES.—A Weymouth newspaper has bewailed the fact that the winter is approaching, when "the intolerable nuisance of having to detrain at Melcombe Regis, and walk through storm and rain to Weymouth Station is necessitated" in order to reach Portland. The Great Western Railway Company have informed Portland Council that they cannot increase the facilities. The neglect of Easton, with its 7,000 inhabitants, is also lamented, and the Portland Council are urged to install a railless trolley car service.

ADVERTISING FOR TRAFFIC.—Timely and persistent advertising in the newspapers has apparently done much to increase the pleasure traffic of the London General Omnibus Company this summer. The pleasures of blackberry gathering, and of witnessing the harvesting were two of the subjects which have been utilised to attract attention to the Sunday travelling facilities. Nearly 30 special services are now in operation on Sundays. The parks and commons and the omnibus lines by which these may be reached on any day are dealt with in a handbill enclosed with the monthly map and guide.

THE MALAY STATES AND MOTOR VEHICLES.—Following on the revolution in China, and the adoption of European dress by the Chinese, the Federated Malay States, which are under British supervision, are showing increasing preference for Western comforts. In 1912 motor cars, cycles, and accessories were imported to the value of £184,254, as against £154,542 in 1911. American makers took advantage of the strikes in England to flood Malay with cheap and serviceable pleasure cars. The pre-eminence of the British public passenger car, if its claims are made known, should count for something in the awakening.

PROPOSED PURCHASE OF THE BIRMINGHAM OMNIBUS UNDERTAKING.—It is understood that the Tramways Committee have agreed to recommend the Corporation to purchase the Birmingham and District Motor Omnibus Company's rights in the city for £30,600, inclusive of 30 omnibuses, garage and works. The Corporation on September 30 decided to include in their Parliamentary bill for next session a clause to enable them to provide and run omnibuses. When this power is obtained the Corporation will have control of both forms of public passenger transport, and the 'buses will be used for developing new routes as well as for traffic in those central streets where the Council have refused to construct tramways owing to the congestion.

CHOICE BETWEEN RAILLESS TROLLEY CARS AND MOTOR OMNIBUSES.—The terms offered with a demonstration motor omnibus being considered prohibitive, York Tramways Committee recommended the City Council at their September meeting to apply for powers to run railless trolley cars along two routes to Heworth and Haxby Road, but the Council referred back the recommendation for further consideration.—The directors of Aberdeen Suburban Tramways Company have received authority from the shareholders to work trolley cars or other mechanically-propelled vehicles, and the chairman has stated that it would not be wise to say definitely what vehicles would be best. There was, he added, a strong feeling in favour of motor 'buses among the directors.

NORTHERN COMMERCIAL MOTOR USERS' ASSOCIATION.—Although only inaugurated at the end of June last, the Manchester, Liverpool, and Counties Commercial Motor Users' Association has reached a membership of 71. The organisation is affiliated with the London Association and the Royal Automobile Club. The officers have now been appointed. Mr. R. C. Reynolds, of the Bleachers' Association Limited, is the first chairman; Mr. Leo Swain (Messrs. Leo Swain and Company, and the Polack Tyre and Rubber Company, Limited) is the vice-chairman; Mr. John Faulkner (C. T. Faulkner and Company, Limited) is the hon. treasurer; and a representative committee have been elected. The secretary is Mr. Ellis Green, Cromwell Buildings, Blackfriars Street, Manchester.

MEA MAGNETO.—This magneto possesses many novel and important differences to any other on the market, and for ignition purposes on internal combustion engines is claimed to be the most satisfactory. In place of the usual horse-shoe magnet, the Mea is fitted with a bell-shaped magnet so arranged that it can be rotated with the contact breaker. The natural result of this design is that whether advanced or retarded an equally good spark is given. Also a good spark is given at quite low speeds. The first two cars (Peugeots) in the Grand Prix Motor Car Race were fitted with Mea magnetos. No other magneto, or system of ignition was fitted. This seems to indicate the confidence placed in the Mea magneto by the manufacturers of the Peugeot car. The Mea is sold in England by Mea Magneto Company, Limited, Gresse Buildings, Stephen Street, S.W.

FRENCH COMMERCIAL VEHICLES.—Presiding at the annual meeting of Delahaye and Company, Limited, at the Great Eastern Hotel, London, Mr. A. A. Campbell Swinton stated that the business in heavy vehicles for 1912 showed a large increase over that for the preceding year, and their sale of vehicles for public passenger services and for the conveyance of goods had also considerably augmented. Messrs. Hobson were now their agents in this country for commercial vehicles, and were at the present time supplying the War Office with a number of Delahaye travelling workshops and aviation lorries. The 170 postal vans, of which he spoke last year as being all simultaneously put into use in Paris at two o'clock on the morning of December 1, 1911, without any interruption of the regular service, had continued to give entire satisfaction to the company which was running them.

THE

# Tramway & Railway World

Vol. XXXIV. No. 20. ] LONDON, SATURDAY, OCTOBER 18, 1913. [Established in 1892.

ANNUAL SUBSCRIPTION (Postage Prepaid)—in the United Kingdom, 25s.: for all places abroad, 30s.

Including sixty-four issues, of which twelve are large illustrated numbers, printed on fine art paper.

## NOTICES.

**All Communications and Advertisements for next Saturday's issue should be received not later than 3 p.m. on Friday.**

**Advertisements for the next issue of which proof is desired should reach us by the second post on Wednesday.**

**The Editorial and Publishing Offices of "The Tramway and Railway World" are at Amberley House, Norfolk Street, London, W.C.**

**Telegrams: "TRAMIGRO, LONDON."**

**Telephone: No. 2948 GERRARD.**

# WEEKLY LIST OF TENDERS INVITED.

### CITY OF BIRMINGHAM.

TRAMWAYS DEPARTMENT.

TENDERS FOR UNIFORM CLOTHING AND CAPS.

The Tramways Committee are prepared to receive tenders for the supply of Uniform Clothing and Caps for the Inspectors, Motormen, and Conductors.

Forms of tender may be had on application to the undersigned at the Tramway Offices, The Council House, Congreve Street, Birmingham. Tenders must be made on the form provided, and must be handed in not later than 12 o'clock noon on Monday, the 10th day of November, 1913.

The Committee do not bind themselves to accept the lowest or any tender.

Persons tendering must at the time of tendering and at all times during the execution of the works be paying all their workpeople not less than the standard rate of wages in the districts where such workpeople are actually engaged in the execution of the work, and must be observing the hours and conditions of labour recognised by the Associations of Employers and the local organised bodies of workers in the various trades in such districts. The contractor will be held responsible for the observance of these conditions by any sub-contractor employed by him.

The contractor must also agree to comply with and conform to the provisions of the Trade Boards Act, 1909.

ALFRED BAKER,
General Manager.

The Council House,
Congreve Street, Birmingham.

### THE GREAT INDIAN PENINSULA RAILWAY COMPANY.

The Directors are prepared to receive tenders for the supply of the following Stores, namely:—

| | |
|---|---|
| Points and Crossings. | Brass Hinges, Handles, etc. |
| Cast Iron Chairs. | Wood Handles. |
| Cranked Fish-plates. | Fire-bricks and Clay. |
| Cast Iron Sluice Valves. | Metals. |
| Plumbago Crucibles. | Stationery, etc. |
| Platelayers' Tools. | Galvanised Corrugated Sheets etc. |
| Galvanised Wrought Iron Water-tubes, etc. | |

Specifications and forms of tender may be obtained at this office on payment of the fee for the specification, which payment will not be returned.

Tenders must be delivered in sealed envelopes, addressed to the undersigned, marked "Tender for Points and Crossings," or as the case may be, not later than 11 o'clock a.m. on Thursday, October 23, 1913.

The Directors do not bind themselves to accept the lowest or any tender.

R. H. WALPOLE,
Secretary.

Company's Offices,
48, Copthall Avenue, London, E.C.,
October 15, 1913.

### CORPORATION OF MANCHESTER.

The Electricity Committee of the Manchester Corporation are prepared to receive tenders for the supply, delivery, and erection at their Dickinson Street Generating Station, of

One Storage Battery, Battery Booster, and Switchboard.

Specifications, etc., may be obtained on application to Mr. F. E. Hughes, Secretary, Electricity Department, Town Hall, Manchester, on payment of a deposit fee of £2 2s., which amount will be refunded on receipt of a *bonâ-fide* tender.

Further particulars and information can be obtained from Mr. S. L. Pearce, Chief Electrical Engineer, Dickinson Street, Manchester.

Tenders, duly endorsed and addressed to the Chairman of the Electricity Committee, must be delivered at the Town Hall not later than 10 a.m. on Wednesday, October 29, 1913.

The Corporation do not bind themselves to accept the lowest or any tender.

THOMAS HUDSON,
Town Clerk.

Town Hall, Manchester,
October 13, 1913.

### BURGH OF LEITH.

TRAMWAYS DEPARTMENT.

The Town Council invite tenders for the supply of a Motor Tower Waggon.

Copy specification and general conditions of contract may be obtained from the Tramways Manager, 165, Leith Walk.

Tenders, marked "Tower Waggon," must be lodged with me not later than 28th inst.

The lowest or any tender must not be necessarily accepted.

D. ROBERTSON.
Town Clerk.

Town Clerk's Office, Leith,
October 14, 1913.

### PORTSMOUTH CORPORATION TRAMWAYS.

CONTRACT.

The Tramways Committee invite tenders for the supply and delivery of Uniforms for Tramwaymen for two years. Specification and conditions, and form of tender, may be obtained, and sample garments may be seen, on application to the Office of the General Manager, Town Hall, Portsmouth.

Sealed tenders, endorsed "Tenders for Uniforms," to be delivered to the Town Clerk, Town Hall, Portsmouth, not later than 12 noon on Monday, November 10, 1913.

The Committee do not undertake to accept the lowest or any tender, and reserve the right to accept the whole or any portion of the tender.

W. R. SPAVEN,
General Manager.

Town Hall, Portsmouth,
October 18, 1913.

### COUNTY BOROUGH OF WEST HARTLEPOOL.

TRAMWAYS DEPARTMENT.

Tenders are invited for the supply and delivery of Five Car Trucks. Specification, general conditions, and form of tender may be obtained from the undersigned.

Sealed tenders, endorsed "Car Trucks," must be delivered to Higson Simpson, Esq., Town Clerk, West Hartlepool, not later than noon on Monday, October 27.

The Corporation do not bind themselves to accept the lowest or any tender.

CHAS. BURGESS,
General Manager.

Tramway Depôt,
Greenland, West Hartlepool,
October 14, 1913.

Digitized by Google

## URBAN DISTRICT OF RATHMINES AND RATHGAR.

ELECTRICITY SUPPLY DEPARTMENT.

The Council invite tenders for the supply, delivery, and erection of :—

One 400 kw. Generating Set, consisting of a High-speed Steam Engine direct coupled to two Continuous Current Dynamos in Tandem.

Copies of the specification, general conditions, and form of tender may be obtained from the Township Electrical Engineer on payment of one guinea, which sum will be returned on receipt of a *bonâ-fide* tender.

Tenders, endorsed "Tender for Engine" or "Tender for Dynamos," as the case may be, must be addressed to the Chairman of the Council, and delivered at my office on or before 10 a.m. on Tuesday, November 4.

The Council do not bind themselves to accept the lowest or any tender.

F. P. Fawcett,
Clerk to the Council.

Town Hall, Rathmines, Co. Dublin,
October 16, 1913.

## RHYL URBAN DISTRICT COUNCIL.

ELECTRICITY DEPARTMENT.

The Council invite tenders for the following plant :—

One 160 kw. Diesel Engine Set.

Specification and form of tender may be obtained on application to the Electrical Engineer, Mr. E. H. Wright, Electricity Works, Rhyl, on payment of a deposit of one guinea for each copy, which sum will be returned on receipt of a *bonâ-fide* tender. Sealed tenders, endorsed "Diesel Engine," to be addressed and delivered to me not later than November 19, 1913.

The lowest or any tender will not necessarily be accepted.

Arthur Rowlands,
Clerk to the Council.

Council Offices, Rhyl,
October 15, 1913.

## EGYPTIAN GOVERNMENT.

MINISTRY OF PUBLIC WORKS.

Tenders are invited for the supply, delivery, and erection of :—

6 3,950 KVA Vertical Generators, 3-Phase, 5,000 Volts.
5 875 KVA Horizontal Generators, 3-Phase, 5,000 Volts.
Power House Switchboard.
3 Complete Sub-stations.
40,000 Volt Transmission Line.

Two copies of specification, general conditions, form of tender, etc., can be obtained on and after October 10 from

Messrs. Harper Bros. and Co.,
Consulting Engineers,
13, St. Helen's Place,
London, E.C.,

on payment of £1, which sum will be returned on receipt of *bonâ-fide* tender.

Tenders, sealed and endorsed as instructed, must be delivered to the above address on or before noon of the 10th November, 1913.

(*Continued on page* 379.)

Advertiser wishes to dispose of his copies of the illustrated issues of Tramway and Railway World from August, 1904, to September, 1909; perfect condition. Box 61, Tramway and Railway World, Amberley House, Norfolk Street, W.C.

## IMPROVEMENTS IN EMPLOYEES' CONDITIONS.

During this disturbed year no tramwaymen in Great Britain have been so foolish as to withdraw their labour in support of requests which have been made for improved conditions. Some weeks ago we gave a list of municipal and company tramways which had granted concessions, and in view of the general labour unrest throughout the country it is not surprising that a number of additions have now to be chronicled. It has to be recorded to the credit of the Leeds tramwaymen that they recently refused to strike in support of demands made by the municipal gasworkers and labourers. The union men decided to honourably carry out their agreement which lasts until February next, but they are engaged in formulating an application for improvements on the expiration of the agreement. The Liverpool men, who had an unhappy experience of striking at the time of the railway strike in 1911, are to be given increases of pay at the instance of the manager, eighteen hundred employees sharing advances which will amount to between £6,000 and £7,000 per annum. At Manchester one shilling per week advance has been given, together with payment for overtime at the rate of time and a quarter for the first two hours and time and a half after eleven hours a day. A request for a full nine hours' day for the spare men has not been granted, but the Tramways Committee conceded a claim for seven days' holiday, with pay, instead of six days as at present, though when it came before the Workmen's Committee of the Council it was rejected. Subsequently the latter Committee granted this application in consideration of the exceptional circumstances of the tramwaymen's employment, such as working on bank-holidays when other workmen of the Corporation are free. The position of men engaged in the engineering departments is now to be considered. Ashton and District tramwaymen have gained advances of a farthing and a halfpenny per hour, while at Rochdale time and a-quarter is to be given for all work over eleven hours. Southend Corporation Tramway Committee, after considering returns relating to wages paid in 75 towns, have appointed a sub-committee to frame proposals for increases to all grades. Apparently, efforts are being made to secure further discussion of the badge question at Nottingham, although the men were content to allow it to subside for the present in consideration of the withdrawal of the bonus system and a concession as regards wind screens. At the instance of a Salford alderman, who acts as secretary to the national executive of the union, the Tramways Committee have been asked to receive another deputation, probably because of the fact that there are towns in which badge wearing is permitted. Similar agitations are now going forward at Birmingham and in connection with the Metropolitan Electric Tramway Company's employees. The latter were apparently not affected by the concession on the part of the "General" omnibus section of the London traffic combine, after the British Automobile Traction Company and the National Steam Car Company had led the way in return for a promise of freedom from the strike which then appeared imminent in other cases. Wearing of the badge should be permitted only on the understanding, as in the case of the L.G.O. Company, that any interference with non-union employees is to be regarded as an offence.

## THE MOTOR OMNIBUS AS AN ALLY.

One result of the recent Tramway Conference at Sheffield will be a renewal of interest in motor omnibuses as an adjunct to tramway services. What the delegates saw in Sheffield could not fail to impress them with the advantages of omnibus services as extensions of existing routes; while Mr. Fearnley's remarks on the subject encourage further study of the uses to which omnibuses may now be put by the operators of tramways. Hitherto the tramway man has had at least a latent feeling that the motor omnibus was an enemy rather than a friend, and that he ought to have nothing to do with the vehicle which he has so often been assured by the superficial critic is to supplant his cars. After Mr. Hamilton's paper on "Urban Passenger Transport," the tramway manager will, however, probably have little fear of the outcome of competition between the car and the omnibus in any case where a tramway service is justified. This being the case, he should the more readily appreciate the advantages that the omnibus has as a supplementary means of transport. Much of the prejudice against the omnibus was due to experience with them in the comparatively early days. The machines then were largely experimental, and they caused much trouble, entailed considerable loss, and gave rise in several instances to great disappointment. All that is happily now a thing of the past, and motor omnibuses of the latest types can to-day be bought with as great a sense of security as electrical tramway-car equipment. The working costs are well known to be within certain definite limits, and managers may purchase them without running serious risks. It is, no doubt, true that omnibuses of greater efficiency will be obtainable later, but that is not a sufficient excuse for putting off the use of them. As Mr. Fearnley said at Sheffield, it is most advisable that all our tramway systems should make some experiments with the motor omnibuses without delay. The experience will be useful in a variety of ways. It is fortunate, we think, that such large and successful tram-

Digitized by Google

way undertakings as those of Newcastle, Liverpool, Birmingham and Sheffield are making use of omnibuses on a comparatively large scale. Earlier experiments with a few vehicles have not given sufficient opportunity to obtain reliable details, but with such fleets as those mentioned the results will be put beyond question. Already the vehicles in Sheffield have run over 100,000 miles, and have proved their reliability to the satisfaction of those responsible for their working. Most of the experience has been obtained in the summer, when the service is less exacting, but we have little doubt that the winter's performance will be relatively as good. It will, of course, be understood that in these remarks we have in mind services outside of the Metropolis. There the conditions are special, and there the motor omnibus has achieved a great success. That success has been enhanced by the peculiarly favourable circumstances that provide a free permanent-way for the use of the omnibuses—a condition that cannot be expected to continue indefinitely. But, even allowing for this fact, the London omnibus is an astonishing success financially, while it is an immense boon to the public. In the provinces the conditions are vastly different, but the experience in London and its vicinity augurs well for success further afield. Tramway committees must recognise the fact that motor omnibuses will have, sooner or later, to come into their area. The question for the committees to determine is whether they shall introduce the new-comer or whether they will decline to receive it until forced to do so. Birmingham has set a good example.

## THE RATING APPEAL IN THE HOUSE OF LORDS.

We have received from the Tramways and Light Railways Association the following correspondence which has passed between the Chairman of the Association and the Lord Chancellor with regard to some remarks made by Lord Moulton when delivering judgment in the House of Lords in the rating appeal case of Tottenham U.D.C. *v.* Metropolitan Electric Tramways Company in June last. The judgment was reported in our issue of August 14, 1913.

The Right Honble. Viscount Haldane, K.T.

My Lord,—The attention of the Tramways and Light Railways Association has been drawn to the expressions used by Lord Moulton in his judgment in the case of the Tottenham Urban District Council and Metropolitan Electric Tramways, Limited.

This was an appeal case on the question of the rating of tramways, and while my Association holds very strong views both on the judgment itself and the manner in which Lord Moulton arrived at the decision and announced it, I only desire on this occasion to draw attention to a complete misrepresentation by Lord Moulton of the action of tramway promoters under the Light Railways Act due to his ignorance of the history of the Act itself.

Lord Moulton in his judgment said—

"Tramway promoters were astute enough to see that undertakings which were purely and simply schemes for the construction of tramways in the ordinary sense of the word might be put forward under the guise of being schemes for the construction of light railways, and that *if they could successfully elude the vigilance of the authorities*, they would thereby gain for the tramways the exceptional privileges intended only for undertakings of a widely different character. In this attempt they were only too successful, and by reason of *what I have no hesitation in regarding as an abuse of the Act*, schemes were sanctioned under the authority of the Light Railways Act, 1896, for the construction of what ought to have been regarded as tramways, and subjected to the carefully considered conclusions of the Legislature in respect thereto which are embodied in the Tramway Act."

This statement is both offensive and unjust. Mr. Ritchie, President of the Board of Trade, in introducing the Light Railways Bill, said—

"Under this Bill a scheme for the construction of Light Railways might be proposed by Local Authorities such as a County, *Town*, or District Council, or by a Railway Company, a *Tramway* Company, a company *ad hoc*, or a combination of these."

He went on further to say—

"It was, perhaps, not generally known that local authorities could not at present make *tramways* without obtaining Parliamentary powers in some form or other, and even when such powers were obtained, they could not work the tramways except in special cases. This Bill sought to remove those disabilities."

Mr. Ritchie also said—

"The Bill of the Government would . . . afford facilities for making branches of existing railways upon a large scale, but with a different gauge if it were desired, and also for making such railways as in Belgium."

These Belgian railways are practically the same as our tramways.

Lord Dudley, in introducing the Bill into the House of Lords, said—

"The Bill included not merely all tramways, but all railways which the Board of Trade thought might justly be brought within its scope.

"*It certainly included tramways in towns*, and it might include trunk lines throughout the country."

If Lord Moulton had studied the history of the Light Railways Act, he would at least have refrained from making offensive remarks about those who have built up a great and beneficial industry under great difficulty and discouragement, and a knowledge of the real facts might have prevented him from adopting the biassed and prejudiced attitude which he thought fit to maintain throughout the hearing of the appeal.

I am, my Lord, your obedient servant,
(Signed) Arthur Stanley, Chairman.

September 24, 1913.

My Dear Stanley,—The Lord Chancellor has read your letter of the 24th inst. on behalf of the Tramways and Light Railways Association, and wishes me to write you in answer.

I am afraid that if the Judge in a cause, after the judgments were delivered, were called upon to hear the criticisms of unsuccessful suitors, there would soon be an end of all legal decisions. The inconvenience of such a practice would be specially obvious in the case of the Final Court of Appeal, whose judgment is accepted as the final settlement of the law.

Believe me, yours truly,
(Signed) A. G. C. Liddell,
Private Secretary.

September 30, 1913.

The Right Honble. Viscount Haldane, K.T.

My Lord,—I beg to acknowledge the receipt of your reply to my letter of the 24th ult.

Mr. Liddell states that you read my letter, in which case I fear I must have expressed myself badly, as you have evidently misunderstood its meaning. If you will kindly refer to it again you will see that I did not criticise or find fault with the judgment in the case of Tottenham U.D.C. *v.* Metropolitan Electric Tramways Company, but that I thought it right, on behalf of those interested in the tramway industry, to point out to you that the statement of your colleague, Lord Moulton, to the effect that tramway promoters had made a wrong use of the Light Railways Act (constituting according to him, "an abuse of the Act") was absolutely unwarranted, and I further pointed out that even a cursory study of the history of the Act would have saved Lord Moulton from making a statement—in which you presumably concurred—which was both unfounded and unfair.

The judgment is irrevocable, and the only way in which we can make known our emphatic protest against the manner in which we have been treated by Lord Moulton and yourself is by publishing this correspondence, which I propose to do, after a few days' delay in case you should wish to reply to this letter.

I am, my Lord, your obedient servant,
(Signed) Arthur Stanley, Chairman.

October 6, 1913.

House of Lords, S.W.,
October 11, 1913.

Dear Stanley,—I am desired by the Lord Chancellor to acknowledge the receipt of your letter of the 6th inst.

I am, yours truly,
(Signed) A. G. C. Liddell.

Hon. Arthur Stanley, M.P.

## TRAMWAY AND RAILLESS PROPOSALS.

Bolton.—A Bill is to be promoted for the carrying out of tramway extensions.

Bournemouth.—A considerable length of track is to be doubled and relaid, and the manager has been directed to report generally on the subject of providing omnibuses in connection with the tramways services.

Burnley.—The manager has been asked to report on the question of providing a tramway between Stoneyholme and Brunshaw Bottom.

Cardiff.—For the purpose of preventing congestion the track in Ninian Road is to be doubled at a cost of £6,010.

Dunfermline.—In connection with the Council's town planning scheme at Rosyth, the naval base, Mr. Balfour, of the Dunfermline and District Tramways Company, has stated that when the tramways are extended to the dockyard, the company would pay £1,000 per mile of double track and £500 for single track for road making on all sections of the roads where the tracks could, without detriment, be laid on ballast instead of on granite setts.

Edinburgh.—A proposal for using the self-propelled car on the city tramways and for its working in connection with the existing cable service will be submitted to the Corporation by the Tramways Committee. The new route will begin at the Craiglockhart cable terminus, proceed to Fir Hill, and thence to join the existing

Digitized by Google

tramway at Comiston Road, traversing a pleasant route of 5½ miles. Another scheme provides for an extension to Corstorphine, passing the Zoological Gardens, a distance of 1 mile 660 yards.

NEWCASTLE-ON-TYNE.—By the Tramways Committee a recommendation is to be brought forward in favour of promoting a Bill to extend the tramways to Benton, in the district of Longbenton; Council, and to run motor omnibuses from the terminus to the various centres of the Longbenton Council's area.

NEWPORT.—A scheme for running railless trolley cars within and, without the borough, in the lower part of the Western Valley, is before the Tramways Committee.

NORTHAMPTON.—In February next the work of extending the tramways to Far Cotton and doubling the Kingsthorpe Road section is to be begun, the Corporation arriving at this decision at their October meeting. The Tramways Committee were instructed to consider the question of erecting shelters at various points on the present system.

NOTTINGHAM.—There is to be an extension of the tramways along Derby Road. It is not expected that the work will be started until March next.

PLYMOUTH.—It is proposed to apply for a Provisional Order for tramway extension to Crownhill at an estimated cost of £24,700, inclusive of four cars, and to Laira at an estimated cost of £30,348, inclusive of five cars. Owing to the cost which would be involved in obtaining an Act for running railless trolley cars, as against the small cost entailed by a Provisional Order for tramway extensions, the committee regretted that they were unable to submit reliable estimates relating to the former system.

PRESTON.—The Tramways Committee recommend the promotion of a Bill for powers to extend the tramways on three routes.

WALSALL.—It is proposed by the General Purposes Committee that steps be taken to promote a Bill both for extending the tramways by means of trolley vehicles and also motor omnibuses.

WEST BROMWICH.—At the October meeting of the Town Council a memorial was received asking the Corporation to avail themselves of the powers conferred by the Corporation Act in respect of the provision of vehicular conveyances to and from the Old Church district. The Highway Committee presented a report stating that they were considering the question. The Borough Surveyor had been to Leeds, Bradford, and other places where trackless trolley systems were in operation.

YORK.—Powers will be sought next session for an extension of the tramways through Walmgate to Hull Road, and to the centre of Acomb Village, together with railless trolley car installations to Heworth; from Nessgate along Huntington Road to Haxby Road; to the Leeman Road district via Bootham and Clifton, and into the Burton Road district. Alderman Meyer, chairman of the Tramways Committee, has stated that the extensions proposed would mean practically the doubling of the present mileage, which cost £130,000, at an expenditure of only £72,000. Probably the actual cost to the city would be a ¾d. rate, and if that were so, there was no risk to the city, because the tramway assessment produced that amount for the rates. Motor 'buses as a permanent service would be more expensive than tramways, though the inclusion of such powers in the Bill would be extremely useful for testing new routes.

## L.C.C. TRAMWAY MATTERS.

The London County Council resumed their meetings after the summer recess on Tuesday last when the agenda contained numerous reports of the Highways Committee relating to the tramway undertaking.

### ADVERTISING THE TRAMWAYS SERVICES.

In regard to advertising the tramways, the Highways Committee stated that for some time copies of the tramway map and guide had been distributed in the Council's schools, and the following arrangements had now been agreed upon in connection with the education service:—A tramway map to be arranged in 12 sections and the blocks for these sectional maps to be provided by the education officer at actual cost and to indicate evening institutes and polytechnics, this map to be part of the booklet of trade classes, etc., circulated each year. A special tramway map to be prepared, showing the schools of art, polytechnics, secondary schools, etc., this map to be published with the hand-book of classes for teachers dealt with by the secondary school section. Reference to be made to the tramway service where applicable to secondary and special schools advertised in the local press. Posters proposed to be exhibited in respect of secondary schools to indicate, where applicable, the tramway routes which might be used with advantage, 500 whole side spaces on the cars to be used during September and October for advertising the education service if spaces are available, and 1,000 ventilator glaciers (if available) to be used in addition to the 280 ventilator glaciers already provided for advertising secondary schools. The chief officer of tramways to arrange for the printing and issue of a leaflet giving a list of universities, polytechnics, and other educational institutes, and the appropriate tramway services. The tramway routes serving the different districts to appear on the posters advertising the schools.

It was further recommended that a resolution of July 8 last authorising the invitation of tenders for the provision of illuminated signs in connection with the advertising of tramway service on tramway buildings and other sites should be rescinded.

### GREENWICH POWER STATION DEVELOPMENT.

The Committee reported that under arrangements which had been made the Anglo-Swedish Electrical Welding Company had repaired defective flanges on the steam pipes of Greenwich generating station at a cost of £785 16s.

Tenders had been received for the provision of foundations required in connection with the substitution of turbines for reciprocating engines at the Greenwich station, and the Committee had accepted the tender of Kerridge and Shaw. The amount according to the priced schedule was £7,230, but this did not represent the value of the work, which would be measured and valued on the detailed prices in the accepted schedule. After the receipt of the tenders it was ascertained that the delivery of the first turbine might be expected towards the end of November, and it had been arranged that Kerridge and Shaw would complete the foundation work for the first turbine in three months instead of four, subject to the payment of an additional sum of £375.

The under-mentioned tenders for the provision of high tension switchgear, etc., required for Greenwich station were opened during the recess:—

| | | |
|---|---|---|
| Bertram Thomas ... ... (incomplete tender) | £10,823 | 0 0 |
| British Westinghouse Co. ... ... ... ... | 17,915 | 5 8 |
| British Thomson-Houston Co. ... ... ... | 2,112 | 10 0 |
| Siemens Bros. Dynamo Works ... ... ... | 20,073 | 13 8 |
| Ferranti, Limited ... ... ... ... ... ... | 22,304 | 8 0 |
| Johnson and Phillips ... ... ... ... ... | 22,886 | 0 0 |
| A. Reyrolle and Co. ... ... ... ... ... | 24,351 | 2 6 |

The estimate of the chief officer was £18,000. In submitting his tender Mr. Bertram Thomas stated that as he had been unable to obtain a quotation for the coupler switches of the special make called for no figure had been included therefor in his offer, but that he was prepared to quote for an alternative switch. The Committee decided to accept the lowest complete tender, and acting on authority given them they accepted that of the British Westinghouse Company, with power to sublet as follows:—(1) Johnson and Phillips, cables; (2) British Thomson-Houston Company, coupler switches and regulators; (3) Morgan Crucible Company, carbon resistances; (4) Everett, Edgcumbe and Company, relays.

The Committee had accepted an offer by J. Cochrane and Sons for the laying of condensing water pipes in the bed of the River Thames at Greenwich station, on the basis of the actual cost of labour and materials, together with a percentage of 13.05 not exceeding £2,750 for general charges and contractor's profit.

The Committee had accepted the offer of the British Westinghouse Company to supply for £5,043 thirteen reactance coils and two steel valve chests required for the provision of protective devices for the existing plant at Greenwich station.

### WIRING OF CAR SHEDS.

The Council on March 4 last accepted the tender of Williams and Bach amounting to £2,139 11s. for the wiring of the Camberwell and Cressy Road car sheds. During the summer recess the firm asked to be released from the contract. The Committee agreed, and decided to accept the tender of Electrical Installations, Limited, amounting to £2,146 0s. 11d.

### SHOREDITCH SUB-STATION.

The Committee had accepted the tender of H. L. Holloway, Deptford, for the provision of foundations for rotary converters to be installed in Shoreditch sub-station and for additional workshop accommodation, etc., the cost to be based on a schedule of prices.

### REFERENCES TO CONCILIATION BOARDS.

The Committee had before the recess considered a request made by trade unions that the rate of pay for fitters, turners, millwrights, tool-makers, slotters, planers, blacksmiths, hammermen, and the various classes of machine workers of the tramway department should be increased by 1d. an hour. They decided not to accede to the request. So far as regarded hammermen, the rate of pay was fixed by agreement arrived at by the Conciliation Board on February 19 last, and was accepted by the Council on March 4. Under the terms of the Conciliation Boards scheme a decision of a board which had been accepted by the Council and the employees might not be re-opened until after the expiration of twelve months. Considerable correspondence took place during the recess, and conference had been held with representatives of the trade unions affected, with the result that it had now been agreed that the application for increased pay (including that of hammermen) should be referred to the appropriate Conciliation Board. A petition had been received from the car-washers employed in the tramway department asking for an increase of 3s. a week in their rate of pay. There were at present 735 regular washers and 115 spare washers. The rate of pay commenced at 27s. 6d. a week, rising to 30s. Spare washers were paid 4s. 7d. a night. The Committee were of opinion that the request should not be agreed to. The men had been informed of this decision, and had now asked that their application should be referred to the appropriate Conciliation Board, and the Committee recommended that this should be done.

All the recommendations were adopted.

### TRAILER CARS.

Replying to questions, Mr. G. H. Hume, on behalf of the Highways Committee, said that the Council were at present operating eight trailer cars. The results had been satisfactory. The certificate of the Board of Trade was only provisional; when the final certificate was received the extension of the trailer car system in London would be fully dealt with. The Committee were alive to its importance. He could not say when the final certificate of the Board of Trade would be received, but the Committee were moving.

**Additional P.A.Y.E. Car at Gateshead.**—The Gateshead and District Tramways Company have recently placed a new P.A.Y.E. car on the Low Fell route.

Digitized by Google

## MISCELLANEOUS NEWS AND NOTES.

**The British Electrical and Allied Manufacturers' Association.**—The annual dinner of this Association will take place on Wednesday, January 21, 1914, when Lord Ampthill will preside.

**Rejection of the Sydney Underground Scheme.**—On October 14 the Legislative Council rejected the Bill, already passed by the House of Assembly, authorising the construction of an underground railway and tramways in Sydney, at an estimated cost of £4,800,000.

**Southport's Railless Trolley Powers.**—The Tramways Committee have directed Councillor Richardson, Alderman Griffiths, and the tramways manager to investigate the question of running cars on the trackless trolley system, as authorised by the new local Act, and have authorised them to visit Leeds in order to see Mr. J. B. Hamilton, the Leeds tramway manager, and report to the committee.

**The Position of Tramway Standards.**—In reply to a deputation from the Lancashire and Cheshire branch of the Roads Improvement Association respecting the erection of tramway standards in Manchester, the tramways manager stated that it was usually found impossible to erect the poles far from the edge of the kerb owing to the numerous gas pipes and electric wires that run under the footpath. He, however, promised always to do his best to meet the Association's wishes.

**Trail Cars in London.**—In reply to an inquiry from the Board of Trade, the Woolwich Council have stated that they have observed no undue interference with the ordinary traffic consequent on the running of trail cars by the London County Council between Beresford Square, Woolwich, and Eltham, and between Nile Street, Woolwich, and Abbey Wood. A number of trail cars are also working most satisfactorily on the route between Embankment and Tooting.

**Return of Dublin Strikers.**—On October 10 the majority of those tramway employees who went on strike applied for reinstatement. Men with a good record were re-engaged, and the full service of cars is now in operation. Mr. W. M. Murphy, chairman of the Tramways Company, in an interview, said that the fight was not against the trade unions at all. It was the fight of the masters to protect themselves against the ruin of their businesses. He went so far as to say that he would not object to the Irish Transport Union if it could only keep agreements like other bodies. For all practical purposes, he said, he is now out of the dispute as far as his concerns are affected.

**Leicester Tramway Employees Praise the P.A.Y.E. Cars.**—At a well attended meeting of the Leicester branch of the Amalgamated Association of Tramway and Vehicle Workers, the advantages of the P.A.Y.E. system over that of the old type of car were discussed, and the following resolution was adopted:—"That we deeply regret the attitude taken by the Town Council, and a small section of the public, with regard to the proposal of Alderman Flint to extend the P.A.Y.E. system in Leicester. Those of us who have had the experience of working both systems, claim that we should know something of the advantages of the P.A.Y.E. over the old cars, and we are unanimous in our approval of the P.A.Y.E. system. We are also unanimously of the opinion, that, viewed from every standpoint, the system is far superior to the old one."

**Liverpool's Separate Entrance and Exit Cars.**—Reviewing the work of the past year on October 10, Alderman F. Smith, chairman of the Tramways Committee, mentioned that on February 16 they decided to have a sample car built of the new type designed by the general manager, with a separate entrance and exit both from the lower and upper decks. The car was found to be very popular, and the committee decided to build six more of the same type, two of which were already in the service and had proved most satisfactory, the remaining four being in course of construction. The committee on January 17 decided to try experimentally automatic point controllers. Two of these appliances were put into service, and one had proved very satisfactory, whilst the other had not proved quite so satisfactory. The system of collecting the fares from passengers as they enter the cars had been tried experimentally for three months, but at the time of the maximum traffic it was found impossible to carry it out to the full extent. The general manager, however, was of opinion that it was helpful to the conductor to collect as many fares as possible on the platform without causing delay.

## PERSONAL.

**Mr. A. T. Goward,** manager of the British Colombia Electric Railway Company at Victoria, has left that city on a visit to the directors in London.

**Mr. J. R. Taylor,** chief clerk, Ashton tramways department, has resigned consequent upon having been appointed to a similar position at Walsall, his native town.

**Alderman Linsley,** chairman of Salford Corporation Tramways Committee and the new President of the Municipal Tramways Association, is the first President elected from outside the ranks of tramway managers.

**Mr. J. Dalrymple,** Glasgow tramways manager, and Mr. Nisbet, master of works, on October 1 had reached Vancouver in the course of their tour to inspect tramway systems and bridges. They were greeted by many former employees of the Glasgow Corporation, nearly a hundred Glasgow tramwaymen now being employed on the Vancouver tramways and in other positions. The travellers are expected to reach Glasgow at the end of October.

**Sir Maurice Fitzmaurice** was a passenger by the P. and O. steamer "Mongolia," which left the Thames on October 3 for Australia, where he is to advise the Government on the question of constructing naval bases.

**Mr. G. C. I. Stuart,** of the Manchester Council's electricity works, and formerly resident engineer at the Brakpan power station of the Victoria Falls and Transvaal Power Company, has been appointed superintendent of the Buenos Ayres power station of the Central Argentine Railway.

**Alderman Fred Smith,** whose accession to the chair of the Liverpool Tramways, Electric Power and Lighting Committee last year was marked by considerable discussion, was, on October 10, at the closing meeting of the Committee for the municipal year, accorded a vote of thanks on the motion of Major Clarke, seconded by Mr. Hutchinson, and supported by Councillors Clancy, Gates, and Robinson. In responding, he remarked that he was in his fifteenth year of service on the Tramways Committee. He had every reason to be thankful for the help that had been given to him by every member of the Committee and all the officials attached to the Committee. He moved a voted of thanks to the deputy-chairman, Major Clarke, who, he said, had been very helpful to him in the work of the Committee. He had never seen a member of the Council who had taken more work in hand. Councillor W. J. Bailes was thanked for his services as chairman of the Electrical Sub-Committee.

**Mr. G. F. Milnes,** whose death at Birkenhead is announced, was for many years connected with the firm of G. F. Milnes and Co., which ultimately became absorbed in the United Electric Car Company, Limited. Mr. Milnes was afterwards the resident representative of that company in London. His son, Mr. G. C. Milnes, who is now in Alberta, and Mr. Voss established the firm of Milnes, Voss and Co., of which Mr. Voss is now the head.

**Mr. J. H. Cawthra,** who, during the past two years had been chief mechanical engineer to the Victoria Falls and Transvaal Power Company, died on October 8 from injuries received while he was motoring near Johannesburg, the car colliding with a train at a level crossing. Mr. Cawthra was from 1901 borough electrical engineer at South Shields, and he had also held a similar position at Swansea. He had also held the appointment of chief assistant electrical engineer at Leeds electricity works.

## CONTRACTS AND ORDERS.

**Ramsbottom Council** have accepted the tender of the Polack Tyre and Rubber Company, Limited, Manchester, for tyres for the railless trolley cars for twelve months, and of Mr. Rawlinson for a tower wagon.

**Bradford Corporation** have ordered 20 Dick Kerr standard 40 h.p. motors, at £104 each, for the tramcars running between Bradford and Leeds. Tenders for supplies to the tramways department have been placed as follows:—Tangyes, Limited, armature winding machine, £88, wheel-turning lathe, £808; Leeds Engineering and Hydraulic Company, Limited, two sets hydraulic jacks, £230; J. Keith and Blackman Co., Limited, smiths' hearths (two single and one double), £81; Carrick and Ritchie, travelling crane, £535.

**London County Council** have entered into contracts as under:—Kerridge and Shaw, provision of foundations required in connection with the substitution of turbines for reciprocating engines at Greenwich power station; British Westinghouse Company, high tension switchgear, etc., for Greenwich power station, £17,915; J. Cochrane and Sons, laying condensing water pipes in the bed of the River Thames at Greenwich power station; Electrical Installations, Limited, wiring of Camberwell and Cressy Road car sheds, £2,140; H. L. Holloway, foundations for rotary converters to be installed at Shoreditch sub-station, and additional workshop accommodation, etc.; British Westinghouse Company, thirteen reactance coils and two steel valve chests required in connection with the provision of protective devices for the existing plant at Greenwich power station, £5,943; Hadfield's Steel Foundry Company, special trackwork for junction lines at Tooting Broadway, £1,800; Ashworth, Son and Company, Dewsbury, 20-ton weighbridge for Belvedere Road depôt, £136; National Rail and Tramway Appliances Company, five hydraulic pit-jacks, £35 10s. each; Carborundum Company, rail grinding blocks for the next 12 months, 4s. 6d. per block, less 2½ per cent. discount, total amount about £270; J. G. Ingram and Son, repair of 196 india-rubber plough bases burnt, etc., estimated cost £196 13s.; John Brown and Co., 18 tons special hard rolled steel plates, £219 (approximately); John Brown and Co., 45 bars of insert steel, £192 (approximately); R. R. Todd, High Holborn, 520 copper bonds, £127; Anderston Foundry Company, 200 cast iron extended arm yokes and 200 cast iron short yokes, £290 15s.; Brecknell, Munro and Rogers, 1,500 trolley wheels, £193 15s.; Imperial Light, Limited, Westminster, 36 acetylene lamps, 1,000 c.p., £135; Bayliss, Jones and Bayliss, 2,000 tie rods for extended yokes, £193.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 60 of the principal undertakings of the United Kingdom for the week ended October 11 amounted to £231,519, or £12,468 more than in the corresponding week last year, while the track mileage was 2,802, or 80 more than for the corresponding week. The receipts were at the rate of £80 17s. 10d. per track mile, an increase of £2 2s. 6d. per mile as compared with last year.

## FINANCIAL REPORTS AND MEETINGS.

**Record Nine Months at Liverpool.**—At the last meeting of the expiring municipal year of the Liverpool Tramways Committee, Alderman Fred Smith reported the first nine months of the present year had proved a record over all previous years, both as regarded total receipts, number of passengers carried, and receipts per car mile. The receipts amounted to £505,016, compared with £469,016 in 1912, an increase of £36,000, or 7.67 per cent. The passengers numbered 107,457,935, against 99,903,672, an increase of 7,554,263, or 7.56 per cent. The mileage was 10,034,045, against 9,349,669, an increase of 684,376, or 7.32 per cent.; and the earnings per car mile were 12.07d., against 12.04d., an increase of .03d.

**The British Electrical Federation.**—The traffic statement for the week ended October 10, 1913, shows that the receipts from tramways and railways amounted to £40,008, as compared with £37,205 in the corresponding week last year, and from omnibuses £11,920, as compared with £1,221, making a total of £51,928, as compared with £38,426. The tramway and railway route mileage was 429.82, as compared with 428.46. The Federation now have 514 omnibuses, an increase of 422 within the year. Upon such of the services as were working, both last year and this year, the receipts show an increase of £2,858 upon the week.

**Manchester's Half-Yearly Results.**—Mr. J. M. McElroy has presented his summary of the results of the working of the tramways department during the first half of the financial year. The mileage run was 9,769,574, an increase of 324,047, as compared with the corresponding period of 1912, and the passengers carried numbered 102,144,962, an increase of 9,920,230. The electrical energy used was 726,927 units fewer—14,673,871 as compared with 15,400,798—and the units per car mile were reduced by .128—1.502 as compared with 1.630. The revenue per car mile was at the same time increased from 11.369d. to 11.561d., but the working expenses per car mile were only increased from 7.002d. to 7.036d.

## COPPER AND ALUMINIUM MARKET.

October 17, 1913.

## WEEKLY LIST OF TENDERS INVITED.

### BOMBAY, BARODA, AND CENTRAL INDIA RAILWAY.

The Directors are prepared to receive up to noon on Tuesday, November 11, tenders for the supply of :—

CLASS A.

(1) Steel Tyres for Carriages and Wagons.
(2) Wheels and Axles.

CLASS B.

(1) Axles for Carriages and Wagons.

Tenders must be made on forms, copies of which, with specifications, can be obtained at these offices on payment as follows :—

For Class A, 20s. each; and for Class B, 10s. each (which will not be returned).

The Directors do not bind themselves to accept the lowest or any tender.

C. CROMMELIN,
Secretary.

Offices : Gloucester House,
110, Bishopsgate, London, E.C.,
October 23, 1913.

### BOURNEMOUTH CORPORATION TRAMWAYS.

The Tramways Committee of the County Borough of Bournemouth are prepared to receive tenders not later than November 17, 1913, for :—

Supply and Delivery of 10 Bogie Electric Tramcars.

Specifications, conditions, drawings, and forms of tender may be obtained on application to the undersigned on payment of a deposit of £2, which will not be returned except on receipt of a *bonâ-fide* tender.

Additional copies may be had on payment of £1 1s. each, which will not be returned.

The Committee do not bind themselves to accept the lowest or any tender.

I. BULFIN, B.A., A.M.I.C.E., M.I.M.E., M.I.E.E.,
General Manager

Tramways Offices, Bournemouth.

### WALSALL CORPORATION TRAMWAYS.

TICKETS AND TICKET REGISTERING PUNCHES.

The Corporation of Walsall invite tenders for the supply to the Tramways Department of Passenger Fare Tickets, with advertising rights; and Ticket Registering Punches (on hire), from January 1, 1914.

Copies of specification, general conditions, and form of tender may be obtained on application at the General Manager's Office, Birchills Depôt, Walsall.

Tenders, sealed and endorsed "Tender for Tickets and Punches," must be delivered to the undersigned on or before Saturday, November 15.

The Corporation do not bind themselves to accept the lowest or any tender, and they will not accept the tender of any firm or person paying their workmen less than the standard rate of wages.

(Sgd.) R. L. HORSFIELD,
General Manager.

Birchills Depôt, Walsall,
October 21, 1913.

### CORPORATION OF LEICESTER.

ELECTRIC TRAMWAYS.

The Tramways and Electricity Committee of the Leicester Town Council are prepared to receive tenders for the supply and delivery of 190 tons of Steel Girder Tramway Rails and Fishplates.

Copies of the conditions of contract, specification, and form of tender may be obtained at my office on and after Friday, October 24, 1913, on payment of the sum of £1, which sum will be returned on receipt of a *bonâ-fide* tender.

Cheques, etc., must be crossed and made payable to the Leicester Corporation.

Sealed tenders, on the forms supplied, must be returned intact, and with all blanks filled up, addressed to the Chairman of the Tramways and Electricity Committee, Town Hall, Leicester, and must be delivered not later than noon on Monday, November 3, 1913, endorsed "Tender for Rails, etc."

The Committee do not bind themselves to accept the lowest or any tender.

E. GEO. MAWBEY, M.Inst.C.E.,
Borough Engineer, Leicester.

Town Hall, Leicester,
October 21, 1913.

### COUNTY BOROUGH OF WOLVERHAMPTON.

ELECTRICITY DEPARTMENT.

Tenders are invited for the supply, delivery, and erection of

One 4,000 kw. Turbo-Alternator, Condensing Plant, and Auxiliaries.

Specifications and form of tender may be obtained from the undersigned on payment of one guinea, which will be returned on receipt of a *bonâ-fide* tender. Extra copies may be obtained upon payment of five shillings for each copy.

Tenders, addressed to the undersigned, must be sealed with wax and endorsed "Tender for Turbo-Alternator," and delivered not later than noon on Monday, November 9, 1913.

The lowest or any tender will not necessarily be accepted.

S. T. ALLEN,
Chief Engineer and General Manager.

Electricity Offices,
Commercial Road, Wolverhampton,
October 22, 1913.

### BOROUGH OF BEDFORD.

ELECTRICITY DEPARTMENT.

The Corporation of Bedford invite tenders from manufacturers for the following Machinery :—

Contract No.
1. 1,000-Kilowatt Mixed-Pressure Turbo-Alternator with Exciter and Condensing Plant.

Contract No.
2. 1 Water-Tube Boiler with Mechanical Stoker and Coal-Handling Plant.

Copies of the drawings, specifications, and general conditions may be obtained from the undersigned. The sum of £1 must be deposited for each specification in the first instance, which will be returned on receipt of a *bonâ-fide* tender. Subsequent copies will be supplied at the rate of 5 shillings each.

Sealed tenders, endorsed with the Contract No., to be delivered not later than noon on the 12th day of November, 1913, addressed to the Chairman of the Electricity Committee, Electricity Works, Cauldwell Road, Bedford.

The Corporation does not bind itself to accept the lowest or any tender.

R. W. L. PHILLIPS,
Borough Electrical Engineer.

Electricity Works,
Cauldwell Road, Bedford,
October, 1913.

## NOTICE.

CONSTRUCTION AND EXPLOITATION OF A RAILWAY.

The "Junta Geral" of the District of Ponta Delgada, Saint Michael's, Azores, represented by its Administrative Committee, makes known that, being duly authorised by the Law of the 20th June, 1913, published in the *Diario do Governo* (Official Gazette) of the Portuguese Republic, No. 140, of the 28th of that month, it will open a Competition for a period of ninety days, to run from the first publication of the aforesaid *Diario*, for the Construction and Exploitation of an Electric Railway, to be laid, as far as may be possible, on the sideways, roadways, and beds of the national and municipal highways between Ponta Delgada and the valley of the Furnas, and Ponta Delgada and the town of Ribeira Grande. The bases of the contract and the respective programme and conditions will be on view at

"The Portuguese Consulate" in London and at Messrs. Wm. Hooton and Yates, 12, Fenchurch Street, E.C.,

where all explanations will be given, only the Portuguese version published in the *Diario do Governo* being valid for all effects.

Secretariate of the Junta Geral of the District of Ponta Delgada, Saint Michael's, Azores.—30th September, 1913. The Administrative Committee.—Manuel Jacintho da Ponte, President.—Filigenio Pimentel, Vice-President.—Joao Candido Borges.—Antonio Joaquin Fernandes.—Members.

## WALTHAMSTOW URBAN DISTRICT COUNCIL.

ADVERTISING ON ELECTRIC TRAMCARS.

The Council invite tenders for the sole right of Advertising upon their Thirty-eight Electric Tramcars for alternative periods of three or five years, commencing on the 15th January, 1914.

Specification and form of tender may be obtained on application to the Tramways Manager, Car Depôt, Chingford Road, Walthamstow, and any information required obtained from him as to the car service and form of contract, etc.

Sealed tenders, endorsed "Advertisements on Tramcars," addressed to the undersigned, must be delivered by post only not later than 12 o'clock noon on Wednesday, the 12th day of November, 1913, at the Clerk's Office, Town Hall, Walthamstow.

The Council do not bind themselves to accept the highest or any tender.

C. Sydney Watson,
Clerk to the Council.

Town Hall, Walthamstow,
October 21, 1913.

## MOTOR TRAFFIC AND ROAD MAINTENANCE.

At the recent conference of the Municipal Tramways Association a great deal was said on the increasing cost of maintaining the paving of tramway tracks owing to the development of heavy motor vehicle traffic. But there is another part of the subject to which the attention of road authorities throughout the country is being increasingly turned, and that is paving and maintenance of roads used by heavy motor vehicles in places where there are no tramways. An important branch of this subject, so far as the metropolis is concerned, is raised in a report by the Finance Committee of the London County Council presented to the Council this week. It is the custom of the Metropolitan Borough Councils to raise loans for carrying out the work of road paving, or extraordinary maintenance, so far as the cost cannot be provided for out of current revenue from the rates. The County Council have to sanction all these loans, and their practice has been—and in this they have the concurrence of the Borough Councils—to discourage loans as much as possible and to have road paving paid for directly out of the rates. The result was that the amounts of loans sanctioned for some years showed a decline, till recently when they have shown a large increase. The following figures give the amounts of loans sanctioned for paving works in the years mentioned:—

| | | | |
|---|---|---|---|
| 1905-6 ... ... ... | £181,200 | 1912-3 ... ... ... | £103,638 |
| 1911-2 ... ... ... | 40,808 | 1913-4 (about 6 months) | 200,035 |

The last figure is for the current year up to the present, which may be taken as about six months. The Finance Committee point out that the great increase has arisen from the development of heavy motor traffic, which means in London for the most part motor omnibuses. This vehicle, it is pointed out, destroys the best macadam roads, and makes it necessary in some cases to strengthen the foundations of roads which have already been paved. Then there is the difficulty that there is no authority which can exercise any control over the routes used by heavy motor traffic. All streets are open to it, and if a line of omnibuses is started along a route where the streets are not constructed to carry such traffic, heavy expenditure on paving becomes necessary. It will thus be seen that there are enormous possibilities of paving expenditure, because the omnibus routes can be changed as often and as much as may be deemed necessary. This is an alarming state of things for the ratepayers. The Finance Committee make the very reasonable suggestion that if certain forms of traffic demand special road construction, they should be limited to specified routes on which suitable paving should be laid. In the Committee's opinion the present state of affairs points to the necessity for control by some authority over the route to be taken by such traffic. They, however, add, apparently in despair, that nothing can be done in this direction without an alteration of the law. There may well be some despair, seeing that it is now eight years since the Royal Commission on London Traffic recommended the formation of a Traffic Board, and nothing whatever has been done by the Government to carry out that proposal. The London trouble is already spreading to the provinces. The road authorities in South Lancashire and some other districts already know of the special expense caused by motor lorries. As to omnibuses, where a local authority seeks to run these outside its own boundaries Parliamentary powers have to be obtained, and these are now coupled with a stipulation for contributions to road maintenance. But companies require no such authority to run omnibuses in country districts, and they are not called on to pay for road maintenance, though the rural roads are not fitted to withstand the traffic. The county engineer of Middlesex stated the other day that the cost of maintaining some of the roads in that county is now about three times the average of a few years ago. As another example, the omnibuses are now beginning to pervade the rural roads in the county of Surrey. These highways will need reconstruction. The same thing may be anticipated elsewhere. The case of London may require separate legislation, but a new law is required for the whole country which will put a charge for the roads on all heavy vehicles plying for profit.

## TRACK DOUBLING AND IMPROVEMENTS IN LAY-OUT.

For a number of reasons it has become desirable that in towns consideration should be given to the questions of converting single lines into a double set of rails, and also of improving the lay-out where points and crossings exist. The former desideratum has been recognised in several of the outer London municipalities and urban districts where single lines entail loss in a double sense, owing to motor omnibus rivalry. Although provincial tramways have not this incentive to effect the improvement, it is satisfactory to find that there are a number of undertakings where doubling has been decided upon. A notable instance is Cardiff, where Sir John Courtis has recently defended the action of the management in undertaking the work in order to relieve congestion and to increase the facilities offered to the travelling public. Sir John added that there were many places in the city where the need exists, and in the course of the discussion it

Digitized by Google

transpired that negotiations are in progress to secure the land required, so that another length of track may be duplicated. Possibly no great length of time will elapse before provincial tramways owners will have to consider applications for licenses from omnibus proprietors. One journal devoted solely to the interests of the latter form of traction has boasted that in the near future the question of the right of local authorities to entirely exclude the competing vehicles may be tested in the Courts. It does not need a great amount of prescience to understand that there is a possibility of such a thing occurring, for now that the needs of the Metropolis have been fully met as regards the number of omnibuses, the manufacturing interests allied with the two chief operating companies will need other outlets for their machines. As we have before suggested, it rests with tramways undertakings to forestall would-be competitors by making use of the railless trolley car or the motor omnibus. Indications are not wanting to show that a record number of applications will be made to Parliament next session not only for motor omnibus powers, but for authority to work the two classes of vehicle, for it is now widely recognised that the petrol car may be advantageously used for testing routes before equipping them with overhead wires. Reverting to track doubling, the city of Norwich may be instanced as another place where the tramways management is animated by adequate recognition of present-day requirements. Not only are double lines being laid down, but the general situation has been reviewed as regards the lay-out in connection with the renewal of points and crossings. Mr. F. W. Ketley, the manager and engineer, has rightly stated that this is necessary for the purpose of meeting the altered traffic conditions brought about by motor traffic. He has further stated that at the present rate of increase of speed effected by mechanical traction, the tramcar will soon be among the slowest unless powers for speeding up are granted. Undoubtedly, the policy which he is carrying out is a necessary preliminary in a number of towns before applying for authority to run the cars at higher speeds. As an incentive to other authorities to increase the efficiency of their services, we may mention that Southampton has just obtained authority to run at ten miles per hour, instead of eight miles, on several sections. Not the least important improvement resulting from track doubling will be the lessening of the risk of collision and also of cars jumping the rails at loops through motormen neglecting to decrease speed, especially at night, on badly-lighted routes. To the numerous mishaps that have occurred on single lines a serious addition was made on Saturday last, during a fog, on the Tyneside Company's system, when a motorman and a conductor were killed and five other men on a repair wagon injured. On the Ayr tramways two motormen and a passenger were recently injured in a collision on a single line. The London County tramways are not free from the risk of similar accidents. In one busy suburb, where the unreasonable demands of property owners have led to single line construction until such time as their leases run out, the cars shoot several yards across the street, in which there is an omnibus service at two-minute intervals, while at one end of the single line another 'bus service turns at right angles on a gradient and crosses a junction of a double tramway line. The single line, too, is laid on the main London-Brighton road, which is used by hundreds of motor cars.

## MOTOR OMNIBUSES AND TRAMCARS.

Some interesting particulars were given at Tuesday's meeting of the London County Council as to cases brought against drivers of motor omnibuses. On July 16 last the driver of an omnibus pulled up at New Cross Gate in such a manner as to obstruct the whole of the conductor's platform of one of the Council's cars, thus preventing passengers getting in or out without great difficulty. A summons was taken out against this driver for interfering with the traffic on a tramway, and the case was heard on August 21 at Greenwich Police Court, when the magistrate imposed a fine of 2s. and 10s. 6d. costs. The magistrate remarked that he had taken into consideration the defendant's statement that he had been put to considerable expense over the case, and had only just got work, and stated further that the next man summoned for such an offence would be fined the full penalty, as he had had "personal experience of the way the 'buses behaved to tramcars."

Another similar case occurred on June 19, when one of the Council's tramcars was standing at the terminus in Scrubs Lane. About 30 passengers were in the roadway preparing to board the car, when a motor omnibus travelling at eight miles an hour was driven down the road and came to a standstill just in front of the car, the persons intending to board the car being scattered in all directions. The defendant, on being remonstrated with by a traffic regulator, became abusive. A summons was taken out against the driver for reckless driving, and at West London Police Court on July 18 the magistrate came to the conclusion that the driver had driven dangerously, and imposed a fine of 20s. and 12s. 6d. costs.

On July 4 a motor omnibus driven at the rate of 14 miles an hour overtook a car in Fulham Palace Road, and passed on the off-side. When the front of the omnibus was hardly halfway past the car the driver turned sharp to the near side and cut in front of the tramcar. The driver of the car applied the magnetic brake immediately to avoid a collision, the result being that the passengers in the tramcar were severely shaken. A summons was issued against the driver, which was heard at West London Police Court on August 1, and the magistrate convicted the defendant of reckless driving, and imposed a fine of 30s. and 12s. costs.

The second and third summonses were taken out under the Motor Car Act, 1903.

## MUNICIPAL MOTOR OMNIBUS PROPOSALS.

Crewe.—The proposal of the Corporation to obtain Parliamentary powers to run motor omnibuses has been rescinded at a special meeting by 25 votes to eight, the question being referred back to the committee for further consideration. This will involve a delay of twelve months in the application to Parliament.

Manchester.—The Tramways Committee intend to seek powers to run omnibuses in districts outside the city where tramways are either owned or leased by the Corporation, or over which that authority have running powers.

Newcastle-on-Tyne.—On October 20 the Corporation adopted a recommendation by the Tramways Committee to apply for powers to extend the tramways to Longbenton, outside the city, and to run motor omnibuses in the Longbenton Council's area, which has a population of 16,000. Councillor Rodgers mentioned that the Benton boundary tramway extension increased the receipts by £80 a week and the Elswick extension to Chillingham Road increased the receipts from £280 to £555 per week. The motor 'buses to Westerhope now carried the population of the village two and-a-half times a week. So far as Lemington was concerned, they were carrying over 12,000 a week—the population three times over. The Westerhope 'buses were paying, and, moreover, they were feeding the cars to the tune of £20 a week.

West Bridgford.—Five omnibuses are to be purchased at a cost of £3,050 by the Urban District Council, the chassis being of Dennis manufacture and the bodies of the Allen type, which was illustrated in The Tramway and Railway World of July 10 last. The garage is to cost £1,589, and the service is expected to be inaugurated before Christmas.

## L.C.C. TRAMWAY MATTERS.

RETURN FARES.

At last Tuesday's meeting of London County Council the Highways Committee reported on the subject of return fares on the tramways. In the first place they stated that they arranged for the institution of 3d. single and 5d. return fares for maximum distances on a number of the routes south of the Thames. In regard to the results obtained from the return fares already in operation on the southern lines the Committee reported that there had been a rapid increase since the inauguration of these fares in July, 1912, in the number of return tickets sold, that this increase still continued, and that a very large number of high-priced tickets were being issued, indicating that the travelling public were prepared to ride long distances by tramcar. There had also been a marked increase in the total number of passengers carried since February last, when return tickets between intermediate points on various routes came into operation.

In regard to return fares on the northern lines, it appeared that since the introduction of 4d. circular return tickets there has been a very large increase per cent. in the weekly average number of tickets sold.

Digitized by Google

PAY OF REGULATORS AND INSPECTORS.

The Council on March 28, 1899, fixed the rate of pay of traffic regulators and ticket inspectors at £2 2s. a week. At that time the tramways were worked by horse traction, and in view of the fact that the work of some of these men had increased, the Committee were of opinion that the maximum rate of pay should be increased to £2 5s. a week. The estimated cost of giving effect to the proposal was about £250 a year.

CHAIN GRATE LINKS.

The Committee reported that the Brightside Foundry and Engineering Company, Sheffield, the contractors for 1912-13 for the supply of chain grate stoker links for use with the boilers at Greenwich generating station were compelled, owing to pressure of work, to sublet part of the contract. Large quantities of the castings supplied by the sub-contractors were however unsuitable and were rejected, and the Committee therefore arranged for the supply from the makers of the boilers, Babcock and Wilcox, of 5,000 links at £18 12s. a thousand, and 5,000 links at £28 a thousand.

A GENERAL SURVEY.

Mr. Cyril Cobb, chairman of the Council, in the course of the annual address from the chair, said in reference to the Council's tramways that they carried no less than 512,052,053 passengers during the year ended March 31 last, while the income amounted to £2,251,729. Powers were obtained in 1912 to use trailer cars and to run cars for special purposes. At the end of the year arrangements were made for the distribution free of charge of a small folded route map with diagrams of the tramways with the number of each route. The system of return fares which was in operation for some years on routes north of the Thames had also been applied to certain routes on the south side of the river. An important scheme had been approved, and was now in hand for increasing the power capacity at the Greenwich generating station, by substituting turbine engines for the reciprocating plant. He also referred to the inquiry taking place by a Special Committee as to the supply of electricity in London.

## MISCELLANEOUS NEWS AND NOTES.

**Trail Cars for Bolton.**—Power to run trail and coupled cars is being applied for by the Corporation. Five tramway extensions are also proposed.

**Removal of Central Standards.**—As a first instalment of a promise made to motorists, the Darlington tramways department are removing the centre standards in the narrower thoroughfares.

**Rawtenstall Generating Station to be Extended.**—The Corporation have decided to make application to the Local Government Board for sanction to the borrowing of £10,000 for extensions required at the electricity works at Harcholme.

**Standard for Fishplates.**—The Engineering Standards Committee has issued a British standard specification for steel fishbolts and nuts for railway rails. The specification prescribes the quality of the steel and the tests, but does not deal with the system of design.

**The Proposed P.A.Y.E. Extension at Leicester.**—The Tramways Committee have ordered ten new top-covered cars which are to be so constructed as to be capable of being operated on the P.A.Y.E. system in the event of the Town Council deciding to add to the number of such cars now in use.

**Manchester Tramways Improvement Scheme.**—Manchester Corporation have under consideration a scheme to enable the running of a double line of tramways right across Cross Street into Albert Square, thereby relieving the present congestion of traffic in the bottle-neck leading to the Square. This improvement involves the purchase of property valued at £80,000.

**Enforcing Tramcar By-Laws.**—During the past quarter inspectors in plain clothes have been engaged in travelling on the Glasgow tramcars, with a view to detecting contraventions of the by-laws. Between July 25 and October 11 they noted 223 cases of spitting on cars, and also a large number of cases of children hanging on to the rear of the cars. In all, no fewer than 848 offences of various kinds have been booked.

**Curtailment of Police Passes.**—It was reported at the October meeting of West Hartlepool Council that the passes to the police on the tramcars would in future be restricted to the superintendent of the police, two inspectors, four detectives, and any other approved case. The privilege of riding free had, it was said, been very greatly abused to the detriment of the ordinary passengers and also to the finances of the Corporation.

**Farm Produce per Tramcar.**—In connection with an agitation for a railway from Stourbridge to the village of Kinver, it is pointed out that partly as a result of the agitation a tramway line has been laid from Amblecote and Stourbridge to Kinver, and has been largely instrumental in Kinver's later development. On the whole the cars have served the district well; but there are certain disadvantages which, as local people say, include a lack of adequate facilities for the transport of farm and garden produce.

**Vehicle Workers to Consider Amalgamation.**—To draft a scheme for the amalgamation of all the vehicle workers' unions in the United Kingdom, a conference was held at Leicester on October 23. Six unions had agreed to send representatives—viz., the Cabmen's Union, the Vehicle Workers' Union, the Amalgamated Tramway and Vehicle Workers' Union, the United Carters of England, Bolton Lorrymen's Union, and the Liverpool Carters' Union. These unions have about 500,000 members. The proceedings were adjourned for the consideration of various schemes.

**Birmingham and Telephone Wires.**—A settlement was arrived at on October 9 in the test case before the stipendiary magistrate on the proposal of the Post Office to erect overhead wires in 19 suburban roads. The agreement was that in five of the roads the Postmaster-General would place the wires underground, in one road a special description of pole would be erected, and in the remaining roads ornamental wooden poles would be placed.

**Car Cleaners Ask for Two Free Nights.**—A committee has been formed among the car cleaners at Birmingham to place before the Tramways Committee a request for the following concessions:—Increased pay for both night and day cleaners, on the present scale of 26s., which rises in two years to 28s.; more cleaning to be done during the day; the provision of overalls; and two nights off a week in succession. As the men work during the night preceding their day off they need to go to bed in the daytime, and cannot stop up all the night that they are free from duty.

**Scheme to End the Sheffield Difference.**—The Tramways Committee have adopted a recommendation made by the general manager for time-and-a-half rate of pay to be given for all Sunday work to all employees who have completed five years' service who are not at present in receipt of time-and-a-half or a higher rate for such work. All employees now get time-and-a-quarter, which was granted in July, 1906, at a cost of £2,028 per annum. The new concession will cost £540 a year, and Mr. Fearnley states that if it is granted a number of applications which he had received for increases in wages may be considered disposed of. The committee's report was adopted by the City Council on October 22.

**The Suggested Rating of Motor Omnibuses.**—St. Pancras Borough Council on October 8 decided to take no action in response to a communication asking them to support a suggestion for enabling any rating authority in the metropolis to charge and recover from Side Tramways Company's system. The cars met on the same line, pound on the annual value of the undertaking in such area as should equal the amount of the general rate imposed. Councillor Harley, who supported the suggestion, said that of ninety miles of road in that borough eleven were used by motor omnibuses, over which 7,000 'bus journeys were made per day with a 'bus mileage of 101 per day, or the enormous total of three and a half millions per year.

**Two Fatalities in a Tyneside Collision.**—During a fog at 7 a.m. on October 18 a repair wagon and an empty car known as the "pitmen's special" collided head on while going at a speed of about ten miles an hour from Gosforth to Wallsend on the Tyneside Tramways Company's system. The cars met on the same line, the men on the wagon expecting that the car would be stopped at a loop waiting for them. The crew of the car, however, would not expect the wagon as it does not run to time. The conductor of the car who had been on the motorman's platform helping to keep a look-out, died in a doctor's surgery, and the motorman expired in hospital the same night. The motorman of the wagon and five permanent way men were injured. The inquests have been adjourned.

**Increasing Demands of Local Authorities.**—A sub-committee of the Renfrew, Lanark, and Dumbarton County Councils have been appointed to confer with representatives of Glasgow in order, if possible, to make an arrangement applicable to all the areas concerned regarding the conditions under which the tramways should be extended outside the city boundaries. In a tramway extension scheme now proposed the County Councils stipulate that all widenings of roads or formation of new roads should be carried out entirely at the expense of the Corporation. Hitherto no wayleaves have been received from the Corporation, who are bound to maintain only the roadways between their tramway rails and 18in. on either side. The County Councils think that the responsibility of the City Council for maintenance should extend further.

**Motorists and London Motor Traffic.**—The Hon. Arthur Stanley, M.P., presided at the October meeting of the Committee of the Royal Automobile Club when Captain Deasy, who gave evidence before the Select Committee on London Motor Traffic on behalf of the Royal Automobile Club and the Roads Improvement Association, submitted a criticism on the report. A long discussion ensued, with the result that the Committee will be specially called at an early date to further consider this important matter. The Chairman pointed out the vital importance to all users of the road of seizing the present opportunity to make a well-considered effort to obtain by legislation proper regulations for motor traffic under a proper authority. He proposed to apply for a meeting of the National Automobile Council at a later date to consider the proposals which would be put forward by the club.

**New South Wales Tramways.**—The report of the Tramways Department for the year ended June 30 last states that the rolling stock consisted of 20 steam motors, 70 steam cars, 1,182 electric motor and 38 trailer cars, and 95 service and other vehicles. The total electric current output for the year at the Ultimo Power House was 89,113,030 kilowatt hours, of which the alternating current supply was 78,090,695 kilowatt hours, and the direct current 11,022,341. Eight and a half miles of track were treated for corrugations with the Carborundum rail grinder. On June 30 there were 207¾ miles opened for traffic, 12½ miles having been opened during the year. The total capital expenditure on lines open for traffic amounts to £6,699,305. Seventy-two fronts of cars were enclosed with glass work. The tramways staff numbers 9,170, and during the year the value of the concessions and advances made to the tramways staff, all grades, equalled £282,230 per annum.

Digitized by Google

**Reduced Tramway Assessments on Account of Competition.**—In response to an application made by the London County Council for a reduction in the assessment of their tramways track to the rates in Lewisham, owing to the falling off in the traffic receipts due to motor 'bus competition, the local Council have reduced the assessment from £9,080 to £5,500. As a consequence the loss to the rates will have to be made up by the ratepayers. On the presumption that the assessments in the other tramway boroughs will be reduced in the same proportion, the £100,000 which the municipal tramway undertaking pays will be reduced to £65,000. This will mean that the 2d. in the pound paid by the tramways to the reduction of their rates will be reduced by about a third of a penny. In addition the ratepayers in nearly every London borough are being called upon to bear the cost of making the roads suitable for motor 'bus traffic. In Wandsworth as a first instalment £20,000 is being expended in paving roads with wood blocks placed on a 9in. foundation of cement. The rate for the current half-year has been increased by twopence.

## CONTRACTS AND ORDERS.

**Chamberlain and Hookham, Limited,** have a contract from Cleethorpes Urban District Council for prepayment meters.

**The "M. and G." Truck and Engineering Company, Limited,** have secured from Aberdeen Corporation the contract for six trucks of their rigid wheel base, 21 E.M. type.

**The Canadian General Electric Company** have secured the contract for the electrification of the Mount Royal Tunnel of the Canadian Northern Railway, which is to open up the suburbs of Montreal.

**Walthamstow Council** have accepted the tender of J. Baker and Co. for a supply of a dozen special tramcar axles at £3 3s. per axle, and that of W. T. Henley's Telegraph Works, Limited, for a supply of feeder cable.

**Clough, Smith and Company, Limited,** Spencer House, South Place, London, E.C., have secured from Keighley Corporation the contract for the erection of the 6,600 volt high tension transmission line between Keighley and Bingley.

**Bradford Tramways Committee** have accepted tenders submitted by F. Parker and Co., Manchester, Beecroft and Wightman, Limited, Bradford, and J. Rhodes and Co., Limited, Bradford, for supplies of timber for tramcar bodies.

**The Great Western Railway** have placed an order with the Railway Track Supply Company (of Great Britain), 81, Gracechurch Street, London, E.C., for one Buckwalter electric industrial truck, for use at their Swindon works. This, we believe, is the first truck of its kind ordered for use in Great Britain. The manufacturers of the Buckwalter trucks have standardised four types of trucks for railway platforms, locomotive machine shops, docks, etc. Further particulars can be obtained from the Railway Track Supply Company on application.

## PERSONAL.

**Mr. Whitaker Thompson,** who has been chairman of the London County Council, has been adopted as the prospective Unionist candidate for East Bradford.

**Mr. Arthur Kenworthy,** chief electrical engineer to Barnsley and District Electric Traction Company, was married to Miss Morris, at Barnsley, on October 22.

**Mr. A. M. B. Grahame** was appointed managing director of Hurst, Nelson and Co. at the annual meeting of the shareholders in the place of the late Mr. Andrew S. Nelson. Mr. Geo. W. Chalmers was appointed works manager.

**Mr. H. E. Blain,** vice-president of the National Association of Local Government Officers, was presented at the annual dinner with a gold watch and chain and a silver tray in recognition of the part he took in forming the Association.

**Mr. E. J. Doran,** after acting for six months as assistant tramway traffic superintendent of the New South Wales tramways at Sydney, during the absence of Mr. H. F. Brown, on leave of absence prior to retirement, has received the permanent appointment to that position.

**Sir John Courtis,** chairman of Cardiff Tramways Committee, speaking at a luncheon given in connection with the acquisition of Grove House by the Corporation, remarked that he had returned from his Canadian tour with big ideas, after seeing some of the cities there, as to what Cardiff should do.

**Councillor Hargreaves,** J.P., vice-chairman of Hull Tramways Committee, has accepted an invitation to become Mayor of the city. Mr. and Mrs. Hargreaves recently opened a bazaar at which £120 was raised for the Tramways Band, and they were congratulated by Mr. W. J. McCombe, the manager, on the honour about to be conferred upon them by the Corporation.

**Mr. A. H. Stanley,** the managing director of Central London Railway Company, City and South London Railway Company, London Electric Railway Company, London General Omnibus Company, Metropolitan District Railway Company, and Underground Electric Railways Company, of London, is referred to as follows in the current issue of the house magazine of Scholey and Company, 151, Queen Victoria Street:—"Mr. Stanley, who has become an outstanding figure in the regeneration of London traffic facilities, while of English birth, received his training wholly in the United States. Prior to his appointment to the London underground systems he was general manager of the Public Service Corporation of New Jersey. He has brought to his high office a remarkable knowledge of all questions associated with traffic, and he has grasped the essential truth that if you go the right way to work to help the public, the public will reciprocate, and hence it follows that the smoothness and celerity with which the London Underground Railway operates is due to two factors: the amazing improvement in the service and the splendid co-operation of the public. To have secured either of these meant much; to have accomplished both suggests an intuition and a deep-seated knowledge of traffic and people which is as remarkable as it is rare."

**Mr. A. L. C. Fell,** chief officer of the London County Council tramways, is the president of the minstrel troupe composed of employees of the department. With the proceeds of entertainments given by the troupe, "L.C.C. Tramwaymen's Cots" are endowed at various hospitals, the latest being at the Belgrave Hospital for Children. Each month a collection is made at all the depôts for the maintenance of the troupe, who would otherwise be rather seriously out of pocket in purchasing music, in the buying and upkeep of instruments, and in fares. The enthusiasm of the minstrels is shown by the case of one member living at New Cross, who must start his daily work at 4 a.m. in order to finish at 6 p.m. to attend the practice at Hackney.

## FINANCIAL REPORTS AND MEETINGS.

**Brazilian Traction, Light and Power.**—The directors have declared a dividend of 1½ per cent. on the issued ordinary capital stock.

**Hong Kong Tramway Company.**—The board announce an interim dividend at the rate of 5 per cent. per annum, free of tax, for the six months ended June 30.

**Brisbane Electric Tramways Investment Company.**—An interim dividend at the rate of 8 per cent. per annum (4s. per share) has been declared on the ordinary shares for the past half-year.

**Sale of Cheltenham and District Light Railway.**—This undertaking, which was opened by the late Mr. T. Nevins in 1901, has been disposed of to J. G. White and Company and Balfour, Beatty and Company for, it is stated, between £90,000 and £100,000.

**Cape Electric Tramways Company.**—The profits for the year ended June 30 were £80,978. To the reserve fund £8,000 has been added, and a dividend of 5 per cent., free of tax, is proposed on ordinary shares, leaving £2,517 to carry forward.

**Norwich Electric Tramways Company.**—For the year ended June 30, after providing for debenture interest, etc., and including £575 brought forward, the net profits were £10,561. The directors propose to transfer £2,500 to reserve (raising that fund to £15,170), and recommend a dividend of 3 per cent., leaving £141 to be carried forward.

**Ferranti, Limited.**—After payment of all charges and expenses of the recent issue of five-year notes, the net profit for the year ended June 30 was £28,142, comparing with £24,333 in the previous year. After payment of debenture and other interests, £10,000 is placed to depreciation and £22,000 to general reserve, carrying forward £452, against £1,245 brought in.

**British Interchangeable Rail Company.**—This private company has been registered with a capital of £15,000 in £1 shares, to acquire patents No. 646 of 1911 and 2466 of 1913, and adopt an agreement with H. Crudgington and H. T. Wakelam. The subscribers are:—H. Crudgington, King's Heath, metal merchant; F. W. Alabaster, Birmingham, merchant. The directors are F. N. Layman, E. Randle, E. Grantham, and H. Crudgington. The registered office is at 28, Victoria Street, London, S.W.

**London Combine Acquire Another Omnibus Undertaking.**—The agreement by which the Underground Electric Railways Company of London, Limited, will acquire outright the New Central Omnibus business provides that the New Central Company will receive £104,000 of 6 per cent. income bonds of 1933 and 48,500 A ordinary shares of 1s. each of the Underground Company, and a sum in cash which will enable the New Central Company, after providing for all prior charges, to pay a dividend at the rate of 8 per cent. per annum for the nine months ended June 30, 1913, from which date the interest and dividends on the new Underground bonds and shares will accrue. As the issued capital of the New Central Company is £96,089 in £1 shares, the purchase consideration provides a little more than £2 of Underground bonds and half a one-shilling A share for each New Central share. At the present prices of the Underground securities this is equivalent to a cash value of about £2 0s. 6d. for each New Central share.

**Hurst, Nelson and Company.**—Sir Thomas Mason, D.L., presided at the annual meeting, held in Glasgow on October 16. The chairman, in moving the adoption of the report and accounts, made reference to the loss sustained through the death of Mr. Andrew S. Nelson, manager and founder of the business. Mr. Nelson, he said, had been looking forward with great hopes to the result of the year's working. The profits were a matter for congratulation. The results obtained were more favourable than those of previous years, and altogether the balance-sheet showed a greatly improved position. They had been able to write off the whole balance of the expenses connected with the formation of the company. He moved that the arrears of the dividend on the preference shares be paid at the rate of 6 per cent., that a dividend of 6 per cent. on the preference share capital from May 15 to November 11 this year be paid, that £5,050 be reserved to pay on May 15 next a half-year's dividend, and that £10,000 be placed to a special reserve fund for security of dividends on the preference share capital. He also moved that a dividend on the ordinary shares of 5s. per share be paid, and that £2,257 be carried forward.

**The British Electrical Federation.**—The traffic statement for the week ended October 17, 1913, shows that the receipts from tramways and railways amounted to £39,401, as compared with £37,133 in the corresponding week last year, and from omnibuses £13,092, as compared with £1,237, making a total of £52,493, as compared with £38,370. The tramway and railway route mileage was 429.82, as compared with 428.47. The Federation now have 514 omnibuses, an increase of 422 within the year. Upon such of the services as were working both last year and this year, the receipts show an increase of £2,783 upon the week.

**Sunderland District Tramways Company.**—An extraordinary meeting of the preference shareholders of the Sunderland District Electric Tramways, Limited, was held at Winchester House, London, recently, for the purpose of considering resolutions for the reduction of the capital of the company. Mr. H. R. Hogg (the chairman) proposed the following resolution:—"That this meeting of preference shareholders hereby approve the proposed reduction of the capital of the company from £170,485 to £51,407, by the cancellation of the sum of 10s. per share upon each of the 95,495 preference shares of £1 each, and the sum of 19s. per share upon each of the 74,990 ordinary shares of £1 each." The resolution was carried. The Chairman then proposed "That the right of the preference shareholders may be varied or modified in the following manner:—(a) That all arrears of dividend in respect of the preference shares be extinguished and cancelled; (b) that as and from the date of this resolution all preference shares be changed from cumulative shares to non-cumulative shares." Mr. G. C. Harvard moved that the following words be added to the resolution:—"Entitling the holders to a non-cumulative preferential dividend of 12 per cent. per annum." The resolution was carried in this amended form. At an extraordinary general meeting the resolutions as approved at the other meetings were adopted. On October 16 the foregoing resolutions were confirmed at meetings of the preference and ordinary shareholders.

## COPPER AND ALUMINIUM MARKET.

October 24, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton:—

## YORKSHIRE (WEST RIDING) ELECTRIC TRAMWAYS COMPANY, LTD.

TENDERS FOR STORES.

The Yorkshire (West Riding) Electric Tramways Company, Limited, invite tenders for the supply, during the year ending December 31, 1914, of the following Stores:—

Schedule No.

3. Bolts, Nuts, and Washers.
4. Brushes and Painters' Tools.
5. Cables and Wires.
6. Copper, Brass, and Gunmetal Castings and Fittings.
8. Cleaning Cloths, Cotton Waste, etc.
9. Drysalters' Sundries.
10. Electrical Lamps, Fittings, etc.
12. Engineers' Furnishings, etc.
13. Fibre, Leather, Rubber, etc.
17. Insulating Materials, Tapes, Compound, etc.
19. Iron and Steel.
20. Lubricants, etc.
23. Overhead Fittings.
24. Paints, Varnish, and Transfers.
25. Printing, Books, and Stationery.
29. Springs.
30. Steel Castings, etc. (Manufactured.)
31. Timber.
32. Uniform Clothing.

Schedules may be obtained from the Central Offices, Belle Isle, Wakefield, after November 9. A charge of 1s. (which is not returnable) is made for each schedule in duplicate, and a remittance covering the charge for schedules required must be sent with each application.

Samples may be inspected at the Company's Stores at Belle Isle, Wakefield, on November 19, 20, and 21 only, between the hours of 10 a.m. and 5 p.m.

Contractors are invited to call and examine the samples before tendering.

Sealed tenders must reach this address not later than 9 a.m. on Friday, December 5.

H. England,
General Manager.

Belle Isle, Wakefield, Yorks.,
October 25, 1913.

## POSITIONS VACANT.

### ASSISTANTS.

Required Assistants, with thorough experience of street passenger-carrying traffic; should be men with decided organising ability and initiative and competent to deal with traffic problems without supervision. Write, stating age, experience, and salary expected, to Box 4801, Willings, 125, Strand, W.C.

# WEEKLY LIST OF TENDERS INVITED.

### COUNTY BOROUGH OF BOURNEMOUTH.

TRAMWAYS DEPARTMENT.

TENDERS FOR UNIFORM CLOTHING AND CAPS.

The Tramways Committee are prepared to receive tenders for the supply of :—

(a) Uniform Clothing,
(b) Uniform Caps,

for their Inspectors, Motormen, and Conductors.

Forms of tender may be had on application to the undersigned at the Tramways Offices, Lansdowne Crescent, Bournemouth.

Sealed tenders, which must be made on the official form and enclosed in the printed envelope provided, to be delivered to the Town Clerk, Municipal Buildings, Bournemouth, not later than 12 o'clock noon on Thursday, November 20, 1913.

The Committee do not bind themselves to accept the lowest or any tender.

The contractor will be required to pay not less than the standard rate of wages current in the district where the goods are made.

I. BULFIN,
General Manager.

Tramways Offices, Bournemouth,
October 29, 1913.

### THE DUBLIN UNITED TRAMWAYS COMPANY (1896), LTD.

The Company is prepared to receive tenders for the supply of General Stores, including Car Fittings, Iron, Steel, Castings, Oils, Paints, Glass, Brushes, Ironmongery, Harness, Materials, Electric Supplies, Timber, etc., for the year ending December 31, 1914.

Forms of tender (price 2s. each), conditions, and all information can be obtained and patterns seen at the Secretary's Office, 9, Upper Sackville Street, from the 3rd to the 15th November, 1913.

Prices and quality being equal, preference will be given to goods of Irish manufacture.

Tenders, sealed and marked on the outside "Tenders for Stores," and addressed to the Chairman, Dublin United Tramways Company, must be lodged with me on or before November 17, 1913.

(By order) R. S. TRESILIAN,
Secretary.

9, Upper Sackville Street, Dublin,
October 27, 1913.

### SURBITON URBAN DISTRICT COUNCIL.

MOTOR FIRE ENGINE AND MOTOR TENDER.

The above-named Council are prepared to receive tenders for the supply of a Motor Fire Engine and Motor Tender. Further particulars and conditions of tender may be obtained from the undersigned.

FREDERICK W. WOOD,
Clerk to the Council.

District Council Offices, Surbiton,
October 21, 1913.

### WALSALL CORPORATION TRAMWAYS.

STORES.

The Corporation of Walsall invite tenders for the supply to the Tramways Department for the year 1914 of the under-mentioned Stores :—

| | |
|---|---|
| Motor Grease. | Gears and Pinions. |
| Lubricating Oil. | Insulating Material. |
| Brushes. | Trolley Wheels. |
| Cleaning Material. | Etc., etc. |

Forms of tender and further information may be obtained at the Tramway Manager's Office, Birchills Depôt, Walsall.

Tenders, sealed and endorsed "Tender for Stores," are to be sent to H. Lee, Esq., Town Clerk, Council House, Walsall, on or before November 22.

Samples (which will not be paid for by the Corporation) are to be sent to the Birchills Depôt, Bloxwich Road, Walsall.

The Corporation do not bind themselves to accept the lowest or any tender, and they will not accept the tender of any firm or person paying to their workmen less than the standard rate of wages.

R. L. HORSFIELD,
General Manager.

Birchills Depôt, Walsall,
October 29, 1913.

### WALTHAMSTOW URBAN DISTRICT COUNCIL.

ADVERTISING ON ELECTRIC TRAMCARS.

The Council invite tenders for the sole right of Advertising upon their Thirty eight Electric Tramcars for alternative periods of three or five years, commencing on the 15th January, 1914.

Specification and form of tender may be obtained on application to the Tramways Manager, Car Depôt, Chingford Road, Walthamstow, and any information required obtained from him as to the car service and form of contract, etc.

Sealed tenders, endorsed "Advertisements on Tramcars," addressed to the undersigned, must be delivered by post only not later than 12 o'clock noon on Wednesday, the 12th day of November, 1913, at the Clerk's Office, Town Hall, Walthamstow.

The Council do not bind themselves to accept the highest or any tender.

C. SYDNEY WATSON,
Clerk to the Council.

Town Hall, Walthamstow,
October 21, 1913.

## POSITIONS VACANT.

### WALTHAMSTOW URBAN DISTRICT COUNCIL.

ELECTRICITY DEPARTMENT.

The above Council require the services of an Assistant in the Electrical Engineer's Department at a commencing salary of £150 per annum.

Candidates must have had experience on an undertaking combining three-phase and direct current systems of supply, and preference will be given to those conversant with mains' work.

Applications, in candidates' own handwriting, stating age, full particulars of training and experience, and accompanied by copies of three recent testimonials, endorsed "Assistant in Electricity Department," to be sent by post only to the undersigned, not later than 5 p.m. on Wednesday, the 12th day of November, 1913.

C. SYDNEY WATSON,
Clerk to the Council.

Town Hall, Walthamstow,
October 28, 1913.

## COUNTY OF LONDON.

CHARGE SHIFT ENGINEER AT THE GREENWICH GENERATING STATION.

The London County Council invites applications for the position of Charge Shift Engineer at the Greenwich Electricity Generating Station in the Tramways Department at a salary of £250 a year, rising by annual increments of £10 to £300 a year.

Members of the Council's staff are not precluded from making application for the appointment. Candidates must be not less than 28 and not more than 40 years of age, and have had experience in the running and maintenance of high-tension electrical plant, steam turbines, and water-tube boilers.

Applications must be made on the official forms, which may be obtained, together with a statement of the conditions upon which the appointment will be held, from the Clerk of the Council, County Hall, Spring Gardens, S.W., to whom the application forms must be returned not later than 11 a.m. on Wednesday, November 12, 1913.

All communications on the subject must be marked on the envelope "Charge Shift Engineer," and a stamped addressed foolscap envelope must be enclosed. The canvassing of members of the Council will be held to be a disqualification for the appointment.

JAMES BIRD,
Deputy Clerk of the London County Council.

County Hall, Spring Gardens,
October 23, 1913.

## COUNTY BOROUGH OF WEST HAM.

TRAFFIC SUPERINTENDENT.

The Council invite applications from qualified persons for the position of Traffic Superintendent of their Tramways, at a commencing salary of £225 per annum.

The person appointed will be responsible to the Tramways Manager for the proper and efficient working of the Traffic Department, including the ticket and cash branches.

Applications, in candidate's own handwriting, stating age, experience, and present position, together with copies of three recent testimonials, must be addressed to Mr. J. S. D. Moffet, Tramways Manager, Tramway Offices, Greengate Street, Plaistow, E., not later than 10 a.m. on Wednesday, November 12, 1913.

H. W. GREAVES,
Town Clerk.

Town Hall, West Ham,
October 29, 1913.

## ASSISTANTS.

Required Assistants, with thorough experience of street passenger-carrying traffic; should be men with decided organising ability and initiative and competent to deal with traffic problems without supervision. Write, stating age, experience, and salary expected, to Box 4801, Willings, 125, Strand, W.C.

## RETURN TICKETS AND IMPROVING RECEIPTS.

Motor omnibus competition with tramways has evidently entered on a new and interesting phase. The subject was discussed at considerable length at the recent Municipal Tramways Conference, and it was agreed that the tramways in London were very hardly hit by a form of competition which contributes nothing to the maintenance of the streets. For a long time the traffic receipts of the London County Council tramways showed steady decreases as compared with the corresponding periods of the previous year, and it will be remembered that for the financial year 1912-13 the accounts revealed that after making allowance for interest and sinking fund there was practically nothing left to go to the reserve. The omnibus competition was a factor, however, in stimulating the Highways Committee of the London County Council to make further efforts to popularise their tramway system, and it seems a pity that these efforts were not begun at an earlier date before the omnibus competition became so acute. For many years cheap return fares had been in force on certain routes of the tramway north of the Thames, but it was not until July, 1912, that the Council began to experiment with such fares on the routes south of the river. The system was then gradually developed until now return tickets are issued not only on all the through routes for the entire distances, but they are also obtainable for certain intermediate stages. They mean a saving of at least 1d. for the double journey as compared with two single fares. Last week the Highways Committee reported that in consequence of the return fares there has been a rapid increase in the number of return tickets sold; that this increase still continues, and that a very large number of high priced tickets are being issued, indicating that the public are prepared to ride long distances by tramcar. There has been a marked increase in the total number of passengers carried since February last, when return tickets between intermediate points came into operation. This week the Highways Committee go a step further, because they announce that they have arranged for return fares for no fewer than thirty-one different journeys in South London which require change of cars. The new feature now becoming increasingly evident is that the traffic receipts from the Council's tramways have turned the corner. The long series of decreases as compared with the previous year have come to an end, and since the early summer the receipts week by week have shown increases which are now amounting to about £2,000 a week, or an increase of 5 per cent. This increase is not, of course, due solely to the development of the return ticket system, but undoubtedly that has been a material factor. Another cause is undoubtedly to be found in the fact that motor omnibus competition has now practically reached high water mark. There are few tramway routes of any importance along which omnibuses do not now run, and with great frequency. The omnibus competition can, indeed, hardly be increased. Whenever in any large town local travelling facilities are increased, improved and cheapened, the number of passengers and the traffic receipts increase in a still greater ratio. This is a fact that is even more striking in London, with its vast population, than in any other town in the country. To promote still further the recovery in receipts, the point on which all the tramway managers in the metropolitan area should concentrate, after granting return fares, is regularity of service. In London, owing to the congestion of traffic, this is not an easy matter, but the greater the regularity of the service, the more will the public flock to the tramways.

## INTERNATIONAL TRAMWAY CONGRESS AT BUDAPEST.

The Executive Committee of the "Union International de Tramways et de Chemins de fer D'Interet Local" have accepted the invitation of the Hungarian Government and the City of Budapest to hold the eighteenth biennial International Tramway Congress at Budapest. The date has been fixed for August 31, 1914, and further particulars will be published later. The list of questions selected by the Executive Committee for discussion is as follows:—

1. The policy of the distribution of population in towns with regards to means of transport.

A. The influence of new methods of transport upon the development and extension of great cities. The influence of modern transportation methods upon social customs.

B. Tariffs of tramways and city and suburban railways:—

1. Bases and methods of investigation. Influence upon traffic.

2. Transfer tickets at reduced prices. Influence upon results of working.

3. Season tickets and various methods of calculating their prices.

Reporters: MM. Duval-Arnould, Membre du Conseil Municipal de la Ville de Paris, and Dr. Kuhles, Membre du Conseil Municipal de la Ville de Munich.

2. Corrugation of rails.

Reporters: MM. Busse, Ingénieur en chef de la Grande Compagnie des Tramways de Berlin, and Resal, Directeur de la Compagnie Française des Tramways électriques et Omnibus de Bordeaux.

3. Rails and tires.

A. Investigation into the best shape for rails and tires, in order to obtain the lowest rolling co efficient and a minimum wear of tires on curves. Sections of rails with and without grooves; sections of tires; position of tires on the rails on straight and on curves; influence of wheel-base on curves.

B. Use of special rails for curves (managanese rails; rails with moveable lip adjustable or otherwise).

Reporters: MM. Bacqueyrisse, Ingénieur en chef des Tramways de la Compagnie Générale des Omnibus de Paris, and Minorini, Ingénieur, Directeur des Tramways municipaux de Milan.

Digitized by Google

4. Roller or ball bearings. Results obtained on motor cars, and on trailers. Resulting saving of current secured.

Reporters: MM. Largiader, Directeur des Tramways municipaux de Zurich; Schoerling, Ingénieur en chef des Tramways de Hanovre; and Tobias, Conseiller technique, Directeur des Ateliers des Tramways électriques de Budapest.

5. Motormen, conductors, and inspectors.

A. Methods of instructing them.

B. Ticket checking. Methods of delivery of tickets to conductors, accounting for tickets sold, and collection of money.

Reporters: MM. Noirfalise, Directeur Général de la Société Anonyme des Tramways Liégeois, Liége, and Karl Roethy, Inspecteur en chef des Tramways de Budapest.

6. Special appliances for wagons of narrow gauge lines to facilitate the exchange of goods with standard railways. Results obtained from the point of view of time taken and the cost of transshipment.

Reporter: M. Sapin, Administrateur-Directeur de la Compagnie Centrale de Chemins de fer et Tramways électriques, à Paris, Administrateur des Tramways d'Ekaterinoslaw, Bruxelles.

7. Method of working on a length of line common to different concessions. Division of receipts and expenses.

Reporter: M. Fr. Carnevali, Ingénieur en chef de la Société des Tramways de Turin.

8. Light railway locomotives.

A. Improvements made during recent years.

B. Is it of advantage:—

1. To conceal the wheels and the motor mechanism by a metallic cover?

2. To have a platform at each end of the locomotive?

Reporter: M. Hamelink, ancien Directeur de la Compagnie des Tramways Néerlandais, Utrecht.

C. Employment of superheaters.

Reporter: M. de Soignie, Directeur de la Société Anonyme Mosane pour l'exploitation des Chemins de fer Vicinaux, Andenne (province de Namur).

9. Subterranean feeder cables.

A. Technical conditions which must be met by armoured cables.

B. Use of aluminium as a conductor.

C. Probable life of subterranean cables. Statistics.

Reporter: M. Sekutowicz, Directeur des Exploitations de l'Omnium Lyonnais de Chemins de fer et de Tramways, Paris.

10. Three wire distribution for a tramway system. Distribution by higher tension in the suburbs than in the city. Special arrangements of rolling stock, of the generating machinery, and distribution system in order to meet these problems.

Reporter: M. Sieber, Directeur des Tramways de Nuremberg-Furth, Nuremberg.

11. Advantages and disadvantages of various systems of transforming high tension or alternating current to continuous current; motor-generators, transformers, and rotary transformers, etc.

Reporters: MM. Dalyrymple, General Manager, Glasgow Corporation Tramways, and Sarrat, Ingénieur en chef à la maison E. L. J. Empain, Bruxelles.

12. A. Facilities given to the public for entering carriages; signs at stopping points; distribution of numbers; covered shelters; moveable barriers and corridors and refuges; raised platforms; the advantage at times of heavy traffic of supplementary cars, either motor or trail cars.

B. Means of communicating to the public the destination and route of cars, both inside and outside the cars.

C. Commercial publicity employed for the purpose of increasing the receipts of tramways and light railways.

Reporter: M. Rodolphe de Weck, Ingénieur des Arts et Manufactures, Directeur de la Société des Tramways de Fribourg et du Chemin de fer Fribourg-Morat-Anet, Président de l'Union de Chemins de fer secondaires suisses, Fribourg (Suisse).

## SUGGESTIONS FOR MANCHESTER.

REPLY OF THE TRAMWAYS MANAGER ENDORSED BY THE CHAIRMAN.

As the result of "slack season" correspondence in the Manchester newspapers a meeting was recently held for the discussion of how to bring about "a better Manchester." A committee has since placed suggestions before candidates for the municipal elections. A list of the tramway questions were supplied to Mr. J. M. McElroy, the general manager, on behalf of the "Better Manchester" Committee of Citizens, and on October 26 Mr. McElroy made a statement in reference thereto, and his remarks were confirmed by Alderman Bowes, the chairman of the Tramways Committee.

Nearly all of the questions, Mr. McElroy said, had been before the committee for a considerable time. All this year they had been experimenting with numbers for each route, and they saw nothing to beat the design made in their own workshops. It would be illuminated at night. As to extending the hourly night service to 12.30 on Saturday, the existing service would be continued until Christmas, when the analysis of the passenger returns would be considered. As part of the route numbering scheme small hand maps of the system would be available free to the public. The request for a framed map of the entire system in the cars was covered by the issue of hand maps. With regard to indicating at termini and centres of towns the starting and finishing times of each route, the committee thought of indicating this upon the hand maps. Transfer tickets were open to so much abuse that those authorities which had adopted them now wished they had not done so. In Paris the tickets had been discontinued recently.

Dealing with first-class cars for through cars with no fares less than twopence, Mr. McElroy said "the committee are opposed to first-class cars; in fact the requisition for them had only 50 signatures. As to twopenny fares, you must know that the short penny rider is the backbone of our system. Persons who get long distances for twopence dislike the short penny rider, but he is the very man who puts us in a position to give the long ride for twopence. We cannot cut him out." A window in the sliding door on top of non-bogie cars to save opening the door to collect fares was a very small matter, and they had not given much consideration to it. A dozen times the committee had agreed not to allow district nurses to travel free. If free rides were once given where was the line to be drawn? Salford Tramways Committee had not seen their way to fall in with the suggestion for through cars to Salford, and the idea of an inner circle of cars connecting the railway stations had been tried, and it proved a failure.

Experiments had been made over a series of years with means of protecting motormen, but there are wide divisions of opinion, both from the point of view of management and among the drivers themselves as to their desirability. After all, the important thing was not to do anything which would jeopardise the public safety. The Board of Trade had considered the matter, and were not prepared to make any recommendations or regulations, because they had not made up their minds. Some, including drivers themselves, thought that glass vestibules such as had been tried impaired their vision and hearing. In the matters of providing shelters, with sitting accommodation and lavatories, where possible, and of roofing all island platforms, a joint committee of the Tramways and Sanitary Committees had been at work for two years, and in addition the Tramways Committee had themselves been putting up shelters.

The placing of the sign "Full" on each end of the car had been tried in a number of places and found useless. The guard could not be on the platform all the time, and passengers could get on and off the car while the guard was not in a position to operate the sign. The general manager of the tramways in Glasgow said: "We found the board of practically no utility, and we have ceased to make any use of it." (We may add that in London the sign is found to be useful in preventing rushes being made for a full car and in saving people the trouble of hailing a car at intermediate points.) While admitting that the rotation ticket system was utilised in Paris, Mr. McElroy said it would be impracticable here. Fancy people in a crowded place having to shout "one," "two," or "three," and being admitted to the car in that order. The committee could not adopt the contract ticket system as it led to abuse.

As to the abolition of standing inside cars, the Tramways Committee were considering the whole question of how to meet the requirements of the travelling public. In the first six months of this year 10,000,000 more passengers were carried than in the corresponding period of last year. The problem was therefore becoming very serious. He was preparing a report for the committee on his observations in America, on the Continent of Europe, and elsewhere. The report, which would be issued two or three months hence, would deal with the whole question of passenger transportation in Manchester and the surrounding district. For the present the committee had to admit that it was impossible to give everybody a seat at the times of rush.

## MR. J. DALRYMPLE ON HIS AMERICAN TOUR.

The general manager of the Glasgow Corporation tramways returned to Glasgow on October 27 in company with Mr. T. Nisbet, the master of works to the City Council, after a tour in the United States and Canada. It was on August 9 that the two travellers sailed for New York, Mr. Dalrymple's object being to visit the most important cities where tramways are in operation in order to inspect the latest methods of working and regulation. Mr. Nisbet was charged with the duty of inspecting places where different types of opening bridges may be seen, as the Glasgow Corporation propose to construct a new bridge over the Clyde, the structure to be available for tramcar traffic.

Mr. Dalrymple's previous visit to the North American continent in 1904 to advise the Chicago City Council on the matter of tramway municipalisation had evidently not been forgotten, for in an interview given after his return to Great Britain the Glasgow manager said:—"We were well received everywhere we went. The fame of Glasgow as a municipality has spread far and wide, and the people over there look to Glasgow as the city to be followed and watched in many respects. They were very anxious to get at the facts first hand. In two different places we visited we were simply peppered with questions for an hour and a half by the leading citizens. Americans do not seem to count the cost of anything so long as it is going to be an advantage to the community. In New York, for instance, they were making contracts that would involve the expenditure of sixteen million pounds for additional transit facilities, while in Philadelphia similar proposals were being made to the extent of seven millions.

Digitized by Google

"Just now the tramway systems are in a state of transition over there, because they do not exactly know what is before them in the way of municipalisation. In Canada there are several towns that operate their tramways municipally; but in the States the only one, I believe, is San Francisco, where they are working a single road from one end of the city to the other. But things are moving very fast, and in a short time I expect there will be something done in the way of a change in regard to municipal ownership.

"As respects fares, they are in a great difficulty. The tramway people are quite satisfied our graded system is best. All over America, except in one or two towns, there is a uniform charge of five cents, and this sum has to be paid by passengers travelling over the shortest journey. Another difficulty is that the cities are extending their boundaries to a large extent, and passengers are getting the advantage of travelling over the extended distance without paying anything extra. There is no doubt that the companies have to carry a large number of people at a loss."

Mr. Dalrymple was much struck by the overcrowding of the cars. "At certain times of the day," he said, "when people are going to and returning from their work it is positively scandalous. They cannot understand how we in Glasgow can carry as many people as they do and have no overcrowding." Asked to account for this he replied:—"For one thing nearly all the cars in America are single-deckers, but the chief explanation is that here, with our low fares, we require to maintain a good and a close service during the whole of the day, whereas over there practically all the traffic is done in the morning and at night. The cars are not nearly so well filled between these periods as in Glasgow."

Particular attention was paid by Mr. Dalrymple to the great changes in car construction which are being made, and he mentioned that in New York experiments were being made with a centre entrance car with a very low step. This car was illustrated and described in THE TRAMWAY AND RAILWAY WORLD of May 9, 1912. "The step," he said, "almost touches the ground, which is very convenient for ladies and elderly persons. They are also experimenting with a double-deck car like our own [*vide* THE TRAMWAY AND RAILWAY WORLD, September, 1912], and they seem very highly pleased with it. There are cars of a similar type in Pittsburg, and I understand they are going to try them in Washington.

"In other cities they are experimenting with cars which the passengers enter and leave at the driver's end instead of at the rear. The driver and conductor are both at the front. The advantage is supposed to be that the people getting out by the front run less risk of meeting with an accident. They cannot, for instance, run in front of a car coming from the opposite direction."

What Mr. Dalrymple witnessed in regard to the protection of tramcar passengers at stopping places shows that American towns are far in advance of this country. As far as the danger arises from automobile traffic the public here are given special protection by the first clause of the Motor Car Act, 1904, which deals with driving to the danger of the public. In London the police appear to do nothing to enforce the clause, and the public are ignorant of its existence. It is satisfactory to note, however, that recently the Tramways Department of the London County Council have obtained convictions of motor omnibus drivers under this clause. Mr. Dalrymple's observations upon American practice were made public at an opportune moment, for yesterday (Friday) the Glasgow Corporation had submitted to them the by-laws framed by the magistrates for the regulation of vehicular traffic at tramcar stopping places. These by-laws, as announced in our issue dated October 16, have been agreed to by the Scottish Automobile Club.

"It is very general in America," said Mr. Dalrymple, "that no vehicle whatever is allowed to pass between the car and the kerb at a stopping place. This rule is rigidly enforced at every place I was in. In most cities it is a law, and is strictly observed by automobile drivers and others without question. When the car comes to a stopping place any vehicles that may be behind stop too, and wait till the car goes on. In several cities they go to the length of placing a pole between the kerb and the car lines at a stopping place, so that passengers waiting on a car do not require to stand on the pavement, but can stand with safety on the street. All over America it is recognised that car passengers are part of the traffic of the street, and have to be protected. Drivers of automobiles and other vehicles seem to have fallen into the idea quite easily, and there is no question about it. The pole, I should explain, is not a fixture, but is portable, with an iron base, so that if anything did run up against it it would merely topple over."

---

**Postponement of a Step Towards Linking South Shields with Sunderland.**—South Shields Tramways Committee recommended the Council at their October meeting to obtain a light railway Order for an extension of the tramways to Harton village, at an estimated cost of £14,650. Mr. W. T. Robson, the manager, reported that it was doubtful whether the extension would pay for itself at first, but the geographical position of South Shields obviously indicated Harton as the only available outlet to a charming, and doubtless in the future, populous suburb, while the scheme would be a distinct move towards connecting up with Sunderland. By 23 votes to 18 the Council decided to defer consideration of the subject until such time as Harton was incorporated within the borough.

## L.C.C. TRAMWAY MATTERS.

EXTENDING THE RETURN TICKET SYSTEM.

At last Tuesday's meeting of London County Council the Highways Committee reported that the through and intermediate return fares charged on the southern tramways had proved popular with the travelling public, and satisfactory from the point of view of the tramway undertaking. Up to the present these return stages had on several routes applied only to journeys which could be made without change of car. Numerous requests had lately been made that return tickets should be issued between places which could only be reached by change of car, and to meet this demand the Committee had now approved eight 3d. return fares and twenty-three 4d. return fares for different journeys in South London, for which changes of cars were necessary.

CENTRAL CAR REPAIR DEPOT.

Eleven tenders had been received from selected firms for the erection of the third section of the central car repair depôt. The tenders varied from £25,600 to £30,750, and the architect's estimate was £27,600. The Committee recommended that the lowest tender, that of Charles Wall, Limited, should be accepted.

The reports were adopted.

## MISCELLANEOUS NEWS AND NOTES.

**London Subway Fare Reduced.**—This week the London County Council tramways department have reduced the fare between Southampton Row and the Victoria Embankment, *viâ* the subway, to one halfpenny.

**Plymouth and Self-Propelled Tramcars.**—The tramways manager has presented a report on self-propelled tramcars, stating that the circumstances in Plymouth were so different that he could not recommend their adoption.

**Railless Trolley Car Experiments at Shanghai.**—The Shanghai Electric Construction Company, Limited, are making trials of railless trolley cars, and if the experiments give satisfaction it is proposed to start a number of services on routes which are too narrow to permit of tramway construction.

**Excess Passengers at Birmingham.**—The decision of the Tramways Committee to allow six persons to stand in a car resulted in considerable criticism, and the committee have now resolved to permit six persons to stand up to 9.30 every morning, on Saturday afternoons from mid-day, and on bank holidays all day.

**Petrol-Electric Vehicle for Pietermaritzburg.**—A 40 h.p. petrol-electric char-a-banc has been ordered by the Pietermaritzburg Council, to be used in testing the traffic value of the various routes in and about the city. According to the Board of Trade Journal the Council do not propose at present to take any further action regarding railless trolley cars.

**Private Railless Traction Scheme at Bournemouth.**—A meeting has been held in the lower Charminster Road district in support of a private proposal to apply for Parliamentary powers to run railless cars in the district, and connecting two tramway termini. It was asserted that the Town Council would neither extend the tramways nor licence omnibuses.

**To Discipline Glasgow Football Crowds.**—It is reported that proceedings may be taken against football followers who enter tramcars by climbing over the dashboard or the staircase railings. Offenders are being reported with a view to prosecutions under the following by-law:—"Every passenger shall enter or depart from a car by the conductor's platform in the rear of the car, and not otherwise."

**Opening of a Newcastle Extension.**—The Tramways Committee on October 24 opened the remaining mile of the tramway extension to Lemington by running cars to and from Lemington to Sandy Banks, Newburn. The Heaton Lemington line was opened last August, but the Board of Trade refused to sanction the running of cars beyond Lemington until the vehicles were fitted with powerful brakes, in view of the short steep gradient at Northumberland Road.

**A "Fortune" for a Seat.**—Replying to an inquiry whether the delegate who attended the Municipal Tramways Conference had gathered any information as to suitable seats for uncovered car tops in wet weather, Councillor Linscott replied that no information had been brought before the Tramways Committee. Two or three seats had been made locally, but when they were put into operation they became inoperative. There was a fortune for anyone who could invent a suitable seat.

**Underground Lines and Surface Trailers for Montreal.**—The Montreal Tramways Company are reported to have informed the City Council that they are prepared to construct underground lines and to give transfer from the surface cars to the underground system. Major Hutchinson, the general manager, has announced that 25 motor cars and trailers will shortly be placed in service. The trail cars will couple up close to the motor car, and special appliance will close the doors and fold in the steps of the trailer, before it will be possible for the car to start.

**Municipal Omnibus Projects.**—Aberdeen Tramways Committee have agreed to apply for powers in the new Provisional Order to run motor omnibuses from Bridge of Don to Tarbothill, near the golf course.—Wolverhampton Tramways Committee recommend that a licence should not be granted to an applicant who desires to run a motor 'bus service between Queen's Square and the borough boundary. It is the intention of the committee to submit at an early date a scheme for such a service on that route.—Lancaster Council have resolved to seek powers to run motor omnibuses in the district.

Digitized by Google

**Well-to-do Men Using Workmen's Cars.**—During a discussion by Oldham Tramways Committee on a proposal to give transfers on a certain special car from a factory at workmen's fares, Alderman Greaves spoke of seeing a man in high position in a workmen's car. Councillor Elliot mentioned the case of another man, earning £5 a week who got up earlier than he need to take a workmen's car, and the tramways manager, Mr. Dugdale, referred to another cheap fare man of £10 a week. The manager opposed the idea of transfers, but was directed to consider it and report thereon.

**Passenger's Accident on a Car Platform.**—In the King's Bench on October 23 Mr. C. Burdett, comedian and dancer, claimed damages against the London County Council for personal injuries. Plaintiff's case was that he was alighting from a car when one of his feet caught on the stud on the platform used in connection with the supply of sand to the rails. He was thrown into the road, and as a result suffered injuries to his back. The defendants denied negligence, and said the stud was flush with the platform, and did not cause the fall of the plaintiff. The jury awarded plaintiff £125, and judgment was given accordingly.

**Transit Facilities Required for Trafford Park.**—Mr. Marshall Stevens, chairman of the Trafford Park Estates, Limited, speaking at the annual meeting, stated that the Manchester Corporation Electricity Committee estimated that by their proposed new station in Trafford Park there would be a considerable saving in traffic facilities, so that a year or two's savings would pay for both the land and the facilities. What the Park was most suffering from was the want of tramway connection with Stretford, Urmston, Davyhulme, and Patricroft.—Manchester Council Electricity Committee has decided to apply for authority to purchase the Trafford Park Power and Light undertaking.

**Motor Omnibus Service for Edinburgh.**—A decision was arrived at by the City Council on October 28, by 16 votes to 13, to obtain tenders for three single-deck and three double-deck petrol-electric omnibuses, in order to run a circular four-mile service from West Meadows, foot of Marchmont Road, eastwards to Hope Park, Preston Street, Dalkeith Road to Cameron Bank, Lady Road, Esslemont Road, West Mains Road, Blackford Avenue, Kilgraston Road to starting point on West Meadows. Councillor Harrison, who moved the proposal, estimated the cost of the vehicles at £5,100. The garage would cost £1,500. They had had, he said, various estimates with regard to the loss they would incur. Personally he did not believe the loss would be so great as their financial advisers stated. It was something worth risking a little money for, and it was a necessity for the city to make a forward step in this matter.

**Trail Cars and Motor Omnibuses in Auckland.**—Presiding at the sixteenth general meeting of the Auckland Electric Tramways Company, Mr. C. G. Tegetmeier said that the Public Works Department had approved of the company running coupled cars. This concession would enable them to make a much more effective use of the smaller cars that were sent out in the earlier stages of the undertaking. A request had been made by the exhibition authorities that they should run a service of motor omnibuses in connection with the tramlines, and this the company had agreed to do. Six 'buses had been introduced, and although they did not think there was scope for the profitable operation of omnibuses, yet, if there should be an opportunity in the future of running motor vehicles to advantage, the company was not likely to leave it to others. The dividends announced in our issue dated October 4 were ordered to be paid.

**New Cars for Leicester.**—Ten cars are to be purchased at a cost of £7,000. In moving this at a meeting of the Corporation on October 28, Alderman Flint said that last year the tramways carried the whole population 145 times, and probably this year they would carry them 156 times. The committee, he observed, had recognised the vote of the Council referring back the proposal to fit the new cars for P.A.Y.E. operation. He had taken no part in the controversy on the subject now in progress in the local press, but when talk was indulged in at election meetings as to whether members of the committee were interested financially in the P.A.Y.E. company, he thought he would have the confidence of all his colleagues on the Council in a matter of that sort. An amendment that five of the cars should not be fitted with covered tops was defeated. Alderman Barton remarked that in the bad weather, which lasted eight months in the year, canopy top cars earned more money than open top cars. The former number 50 and the latter 100.

**New and Prospective Work.**—Edinburgh Council on October 28 referred back to the Tramways Committee until April next a scheme to apply for powers for the construction of a tramway from Craiglockhart terminus to Coniston Road, at a cost of £20,000.—It is proposed to extend the existing loop on the Southend Pier tramways by 300ft. and to improve the accommodation at the south station, at a cost of £2,175; and to borrow £600 for the purchase of four additional cars.—A scheme is under consideration by Glasgow Tramways Committee for constructing a tunnel under the hill on which Glasgow University stands, in order to extend the tramways to the residential suburb of Hillhead.—A provisional agreement has been made by Dewsbury Tramways Committee with the National Electric Construction Company for the construction and working of tramways to Dewsbury Moor and Shaw Cross. The Yorkshire (Woollen District) Electric Tramways have offered revised terms upon which that company would be prepared to accept a lease of the tramways to Westborough.—Brighton Council have agreed to rail renewals being made at a cost of £2,750.—Track relaying is to be carried out at Halifax at a cost of £6,300.

## CONTRACTS AND ORDERS.

**Heywood Council** have placed a contract with Mr. Bertram Thomas for alterations to the switchboard at the electricity works.

**Huddersfield Council** have been recommended by the Electricity Committee to accept the tender of Messrs. Switchgear and Cowans, Limited, for a high-tension switchboard, at £2,259.

**Aberdeen Council** have accepted the tender of the Brush Electrical Engineering Company to supply their interpole type of motors for six new cars, and of the British Westinghouse Company for controllers and electrical equipment.

**Mirrless, Bickerton and Day, Limited,** have been awarded a contract for the supply of a Diesel engine and generator at Worthing Corporation electricity works, at £3,785 for the engine and £683 for the generator. The latter will be supplied by Crompton and Co.

**Luton Council** have accepted the following tenders:—Tudor Accumulator Company, Limited, traction battery of 250 cells, £1,137, less approximately £170 for existing battery; Hudson Economiser Company (1907), Limited, cooling tower of 170,000 gallons capacity, £889.

**Salford Council** have allotted contracts to the British Westinghouse Company for the supply of two additional potential transformers on the extra high-tension switchboard, at £42 10s., and to J. Wolstenholme and Son for an additional vertical two stage air compressor at the electricity works.

**Glasgow Electricity Committee** have recommended the Corporation to accept the tender of the American Engineering Company to equip one pair of boilers with their stokers at £1,400 on the understanding that if the stokers do not prove satisfactory the company will remove them free of cost to the Corporation.

**The National Rail and Tramway Appliances Company, Limited,** have contracts in hand at the present time for 70 tons of brake blocks for various Government railways. They are also supplying, among other contracts, brake blocks to the Metropolitan Railway and 7,000 blocks to the London, Brighton, and South Coast Railway.

**Leicester Council** have adopted the following contracts:—J. Chapman and Sons, Limited, of Leicester, builders' work for car repairing shops to be erected in Abbey Park Road, at £1,406; Siemens Brothers Dynamo Works, Limited, building and installing a turbo-generator at Lero electric generating station, with reversible rotary convertors, switchgear, etc., and the installation of a rotary convertor at Aylestone electric generating station, together with the necessary switchgear, at £20,018; Clarke, Chapman, and Co., steam-raising plant necessary in connection with the additional generating plant at Lero station, at £8,212.

## PERSONAL.

**Mr. G. J. Hollyer** has been appointed station superintendent at Walthamstow Council electricity works.

**Mr. F. H. Corson,** electrical engineer to Gloucester Corporation, has been appointed manager of the municipal tramways of that city.

**Mr. W. W. Warren,** charge shift engineer at the London County Council tramway generating station at Greenwich, has resigned his post.

**Mr. G. W. Stevenson** is leaving England for Pernambuco, Brazil, to take up a position with Messrs. J. G. White and Company on the Pernambuco tramways.

**Mr. W. H. Mulhall,** who was formerly associated with Siemens Bros. Dynamo Works, Limited, Dalston Works, as traction lamp expert, has been transferred to the Glasgow branch.

**Mr. Allan B. Field,** chief designer of turbo-electric machinery to the Westinghouse Electric Company, Pittsburg, has been appointed professor of mechanical engineering at the Manchester School of Technology.

**Mr. W. H. Taylor** has resigned the position of assistant electrical engineer at Walthamstow Council electricity works, to accept an appointment as chief station superintendent at the new Government power station at Perth, Western Australia.

**Mr. George W. Chalmers** was elected a director of Hurst, Nelson and Co., Limited, at the annual meeting of the shareholders of their rolling stock and plant works at Glasgow. Mr. Chalmers already held the position of works manager, which he retains.

**Inspector J. Campbell,** Manchester Corporation tramways, has been presented with a silver coffee service by the employees of the Oldham Road branch on the occasion of his retirement. He has also received a clock from passengers on the Rochdale Road section.

**Mr. Henry Criswell,** a native of East Grinstead, who has held an appointment on the engineering staff of the county surveyor for West Sussex, has been appointed chief roads engineer to the Peruvian Government, at a salary of £1,200 per annum. He has had Colonial experience in South Africa and Canada.

**Motorman W. Markham,** Ilford Council tramways, in competition with 300 other exhibitors at the Model Engineer Exhibition at the Horticultural Hall, Westminster, was awarded a bronze medal and certificate for a medical galvanic battery, which he designed and constructed.

**Mr. F. Eggington,** who for some years has been the chief assistant in the West Ham tramways department, has resigned that position in order to take a position under his old chief, Mr. H. E. Blain, of the London Underground Railways. The Tramways Committee have accepted Mr. Eggington's resignation, and are recommending that Mr. Hopkins be appointed to the position at a salary of £250 per annum, rising by annual increments of £25

Digitized by Google

to £300. The committee have appointed Mr. A. C. Debenham to be accounts clerk at £200 per annum, rising to £220 by annual increments of £10; and Mr. J. O'Niel to be traffic clerk at £120 per annum, rising by annual increments of £10 to £150. The filling of the post of traffic superintendent, at a commencing salary of £225 per annum, has been left to the tramways manager and the chairman of the Tramways Committee.

**Miss M. Orr,** who for ten years had held the positions of typist and head of the ticket department of the Musselburgh Tramways Company, has been presented with a dressing case on the occasion of leaving the service. Mr. Bentley, works manager, presided, and Mr. Watson, commercial manager, in handing the gift to Miss Orr, stated that the company were sorry to lose her services.

**Alderman J. H. Corke,** Mayor of Portsmouth and chairman of the Tramways Committee, in distributing the awards for the fifth championship walking match of the tramway employees, stated that the committee had endeavoured to brighten the lives of the men in their service to the best of their ability, and when the men had a grievance they were always ready to receive a deputation and talk matters over. They realised that unless the employees were happy in the work in which they were engaged they could not carry out their duties thoroughly or efficiently.

**Tributes to the Oldham Management.**—At the last meeting of the Oldham Tramways Committee for the municipal year, Alderman Greaves moved that thanks be accorded to the chairman and vice-chairman for their services, and said members might congratulate themselves on the successful working of the department. The taking away from them the overseeing of the surveyor's department had been an excellent move. Councillor Calvert, who seconded, said that he considered Mr. Isherwood to be an ideal chairman and spoke of the genial character of the vice-chairman. The Mayor said that the committee had been well manned and the business well managed. Councillor Hardman referred to the great improvement in the running of the cars, and said it was very largely due to the interest the chairman and vice-chairman had taken in the work of the committee. The chairman, responding, said that he was much obliged for the eulogy. They were all, as a committee, trying to conduct the tramways department in the best way they could. Councillor Grime, who is leaving the Council, was accorded a vote of thanks, and in reply he spoke highly of the way in which Mr. Dugdale managed their great business. A profit was being earned and the cars were running to time. The chairman remarked that since March the receipts had gone up by over £4,000 as compared with last year. Mr. Dugdale (the manager): I think we are doing well because we are running to the time-tables.

---

**Mr. Alfred S. Giles,** general manager and engineer-in-chief of the Lisbon Electric Tramways Company, has died from enteric fever. He began his career on the engineering staff of the Edison Company, Limited, and afterwards served with Thompson, Ritchie and Co. In 1904, while holding the position of engineer to Blackburn Corporation electricity department he was appointed engineer-in-chief to the Cape Tramways Company, and early in 1911 he was transferred to Lisbon. During his tenure of the latter offices he dealt successfully with labour and revolutionary troubles, and came to be held in high esteem by the staff as well as by the directors of the company.

## FINANCIAL REPORTS AND MEETINGS.

**City of Buenos Ayres Tramway Company.**—The directors announce a dividend of 1s. 3d. per share (5 per cent. per annum) for the three months ended September 30.

**Estimated Cost of Preston Tramways Extensions.**—In the Bill to be promoted by the Corporation next session the following financial particulars are given as to the tramway proposals:—Additional generating plant, £5,000; 10 cars, at £750 each, £7,500; alterations at offices and car shed, £6,000; contingent requirements during next seven years, £6,500.

**The Sale of Cheltenham Tramways.**—A sum between £90,000 and £100,000 is believed to be the price at which the Cheltenham and District Light Railway has been sold to J. G. White and Co., Limited, and Balfour, Beatty and Co., Limited. The length of the system is about 12 miles, and it was opened thirteen years ago at a cost of £120,000. An average dividend of 4 per cent. has been paid annually, and last year it rose to 5 per cent.

**The British Electrical Federation.**—The traffic statement for the week ended October 24, 1913, shows that the receipts from tramways and railways amounted to £39,515, as compared with £36,618 in the corresponding week last year, and from omnibuses £12,689, as compared with £1,204, making a total of £52,204, as compared with £37,822. The tramway and railway route mileage was 429.82, as compared with 428.47. The Federation now have 514 omnibuses, an increase of 422 within the year. Upon such of the services as were working both last year and this year, the receipts show an increase of £2,695 upon the week.

**Improved Position at Stalybridge.**—In replying to a vote of thanks to the chairman (Alderman Ridyard) and the deputy-chairman (Alderman Perrin) and to the chairmen and deputy-chairmen of the committees, at the last meeting for the municipal year of the Stalybridge, Hyde, Mossley, and Dukinfield Tramways Board, Alderman Ridyard said that neither the tramways nor the electricity department had ever shown as good results as they did to-day. In the electricity department there was a net profit of £509, and when they compared that with the corresponding period last year, when there was a loss of £90, it meant that they were £600 better off. This had been the same during the whole of the months of the year that were past. Up to the end of the first six months of last year the tramways showed a loss of £6,335; up to the end of September this year (from last March) the loss was only £1,535.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 60 of the principal undertakings of the United Kingdom for the week ended October 25 amounted to £228,968, or £9,024 more than in the corresponding week last year, while the track mileage was 2,862, or 80 more than for the corresponding week. The receipts were at the rate of £80 per track mile, an increase of 18s. 3d. per mile as compared with last year.

## COPPER AND ALUMINIUM MARKET.

October 31, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton:—

**Telegrams: "TRAMIGRO, LONDON."**
**Telephone: No. 2948 GERRARD.**

## WEEKLY LIST OF TENDERS INVITED.

### LONDON GENERAL OMNIBUS COMPANY, LTD.

TENDERS FOR STORES.

The London General Omnibus Company, Limited, invite tenders for the supply during the year 1914 of the following Stores :—

A. Timber.
B. Ironmongery, Coachmakers' and Builders'.
C. Motor Department Stores (various).
D. Colours.
E. Glass and Sundries.
F. Coach Trimmings, Canvas.
G. Leather and Machine Belting.
H. Brushes and Brooms.
K. Building Materials.
L. Gas and Water Fittings.
M. Enamelled Iron Plates.

The schedules may be obtained at the Office of the Purchasing Agent, Electric Railway House, Westminster, S.W., on November 11 and 12, between the hours of 10 a.m. and 4 p.m., or on application per post. A charge of 2s. 6d. (which is not returnable) is made for each schedule.

The samples will be on view at the Company's Premises, Felsham Road, Putney, on November 18 and 19 only, between the hours of 10 a.m. and 4 p.m., where schedules (2s. 6d. each as above) may be obtained during the exhibition of the samples.

Contractors are requested to call and examine the samples before tendering.

Services of the Company's motor omnibuses run past the top of Felsham Road, near Depôt.

Sealed tenders, endorsed "Tenders for Stores," should be addressed to the Purchasing Agent, Electric Railway House, Westminster, S.W., and must reach this address not later than 10 a.m. on Wednesday, November 26, 1913.

### ELECTRIFICATION OF MELBOURNE SUBURBAN RAILWAYS

The Agent-General for Victoria is prepared to receive tenders for the following Apparatus for use in connection with the signalling on the Melbourne Suburban Railways :—

(1) Track Feed Boxes, including Signal Transformers, Switchgear and Accessories.
(2) Track Resistances.
(3) Impedance Bonds.
(4) Track Relays and Relay Boxes.

Tenders can be submitted for any section individually or for all four.

Specifications and forms of tender may be obtained from the Agent-General for Victoria on or after Monday, November 10, 1913. Any *bonâ-fide* tenderer requiring information in addition to that contained in the specifications may apply to the Consulting Engineers, Messrs. Merz and McLellan, 32, Victoria Street, Westminster, S.W.

The charge for one set in duplicate of the four specifications above mentioned is £5 5s. The charge will be the same for any part of a set. Further single sets or parts of sets will be charged for at the rate of £2 2s. per single set or part of a set. Sums paid for copies will be refunded on receipt of a *bonâ-fide* tender for the whole or any complete section of the work.

Sealed tenders, marked "Electrification of Melbourne Suburban Railways: Tenders for Signal Apparatus," are to be addressed to the Agent-General, and delivered at his office in Melbourne Place, Strand, W.C., not later than 12 noon on Monday, December 22, 1913.

The Government do not bind themselves to accept the lowest or any tender, and ample security will be required by the contractor whose tender is accepted.

### CITY OF MANCHESTER.

The Electricity Committee of the Manchester Corporation are prepared to receive tenders for the supply, delivery, and erection at their Stuart Street Generating Station of Two Water-Tube Boilers and Superheaters, Economisers, Coal Chutes, Ash Conveyor, Pipe Connections, additional Stoker Shafting, and Clutches, and Pneumatic Ash Handling Plant to Boiler House No. 2.

Specification, drawings, and form of tender may be obtained on application to Mr. F. E. Hughes, Secretary, Electricity Department, Town Hall, Manchester, on payment of a fee of two guineas, which amount will be refunded on receipt of a *bonâ-fide* tender.

Further particulars and information can be obtained on application to Mr. S. L. Pearce, Chief Electrical Engineer, Dickinson Street, Manchester.

Tenders, duly endorsed and addressed to the Chairman of the Electricity Committee, must be delivered at the Town Hall not later than 10 a.m. on Friday, November 28, 1913.

The Corporation do not bind themselves to accept the lowest or any tender.

THOMAS HUDSON,
Town Clerk.

Town Hall, Manchester,
November 3, 1913.

### COUNTY BOROUGH OF WOLVERHAMPTON.

ELECTRICITY DEPARTMENT.

Tenders are invited for the supply, delivery, and erection of

One 1,000 kw. Rotary Converter Set.

Specifications and form of tender may be obtained from the undersigned on payment of one guinea, which will be returned on receipt of a *bonâ-fide* tender. Extra copies may be obtained upon payment of five shillings for each copy.

Tenders, addressed to the undersigned, must be sealed with wax and endorsed "Tender for Rotary Converter," and delivered not later than noon on Monday, November 24, 1913.

The lowest or any tender will not necessarily be accepted.

S. T. ALLEN,
Chief Engineer and General Manager.

Electricity Offices,
Commercial Road, Wolverhampton,
November 5, 1913.

### NOTICE.

CONSTRUCTION AND EXPLOITATION OF A RAILWAY.

The "Junta Geral" of the District of Ponta Delgada, Saint Michael's, Azores, represented by its Administrative Committee, makes known that, being duly authorised by the Law of the 26th June, 1913, published in the "Diario do Governo" (Official Gazette) of the Portuguese Republic, No. 149, of the 28th of that month, it will open a Competition, for a period of ninety days, to run from the first publication of the aforesaid "Diario," for the Construction and Exploitation of an Electric Railway, to be laid, as far as may be possible, on the sideways, roadways and beds of the national and municipal highways, between Ponta Delgada and the Valley of the Furnas, and Ponto Delgada and the town of Ribeira Grande. The bases of the contract and the respective programme and conditions will be on view at

"The Portuguese Consulate" in London, and at

Messrs. Wm. Hooton and Yates, 12, Fenchurch Street, E.C., where all explanations will be given, only the Portuguese version published in the "Diario do Governo," being valid for all effects.

Secretariate of the Junta Geral of the District of Ponta Delgada, Saint Michael's, Azores.—30th September, 1913. The Administrative Committee.—Manuel Jacintho da Ponte, President.—Filigenio Pimentel, Vice-President.—Joao Candido Borges.—Antonio Joaquim Fernandes.—Members.

## POSITIONS VACANT.

### COUNTY OF LONDON.

CHARGE SHIFT ENGINEER AT THE GREENWICH GENERATING STATION.

The London County Council invites applications for the position of Charge Shift Engineer at the Greenwich Electricity Generating Station in the Tramways Department at a salary of £250 a year, rising by annual increments of £10 to £300 a year.

Members of the Council's staff are not precluded from making application for the appointment. Candidates must be not less than 28 and not more than 40 years of age, and have had experience in the running and maintenance of high-tension electrical plant, steam turbines, and water-tube boilers.

Applications must be made on the official forms, which may be obtained, together with a statement of the conditions upon which the appointment will be held, from the Clerk of the Council, County Hall, Spring Gardens, S.W., to whom the application forms must be returned not later than 11 a.m. on Wednesday, November 12, 1913.

All communications on the subject must be marked on the envelope "Charge Shift Engineer," and a stamped addressed foolscap envelope must be enclosed. The canvassing of members of the Council will be held to be a disqualification for the appointment.

JAMES BIRD,
Deputy Clerk of the London County Council.

County Hall, Spring Gardens,
October 23, 1913.

### COUNTY BOROUGH OF WEST HAM.

TRAFFIC SUPERINTENDENT.

The Council invite applications from qualified persons for the position of Traffic Superintendent of their Tramways, at a commencing salary of £225 per annum.

The person appointed will be responsible to the Tramways Manager for the proper and efficient working of the Traffic Department, including the ticket and cash branches.

Applications, in candidate's own handwriting, stating age, experience, and present position, together with copies of three recent testimonials, must be addressed to Mr. J. S. D. Moffet, Tramways Manager, Tramway Offices, Greengate Street, Plaistow, E., not later than 10 a.m. on Wednesday, November 12, 1913.

H. W. GREAVES,
Town Clerk.

Town Hall, West Ham,
October 29, 1913.

### ROYAL BURGH OF KIRKCALDY.

TRAMWAYS DEPARTMENT.

Wanted at once an experienced Overhead Linesman Apply, giving qualifications and references, to

O. F. FRANCIS,
The Electricity Works,
Kirkcaldy.

## TRACK AND ROAD MAINTENANCE.

Councillor Moxon, the chairman of Newport Tramways Committee, is well advised in following up at this juncture the recent recommendations of the officials of that department and the borough surveyor as to renewal and repair of the track. He has introduced an important suggestion, not only for the carrying out of the work, but for the maintenance of the remainder of the thoroughfares in which the lines are laid. As he observed in a letter addressed to the Works and General Purposes Committee, his suggestion, if carried out, should result in the task being done in the best and most economical manner. In many large towns the responsibility is assumed either by the Tramways Committee or by the Highways Committee, thus doing away with divided control, and Mr. Moxon's suggestion is that the whole of the eight miles of thoroughfares in which there are tramways should be taken from the Works and General Purposes Committee and handed over to a new Committee to be known as the Highways Committee. It would be formed of two members each from the present Committee, the Tramways and the Waterworks Committees, with the surveyor and the electrical engineer as the officials jointly responsible to such Committee. All work would be carried out on the joint recommendation of those officials, and should they differ the decision would rest with the Committee. No difficulty would be met with in apportioning the cost between the tramways undertaking and the borough funds. It is to the lack of so well-defined an arrangement as that now submitted by the chairman of the Tramways Committee, and to the alleged absence of proper supervision of the construction of the track that Mr. Moxon attributes the present unsatisfactory state of affairs; while the work done by direct labour previous to June, 1912, has, he adds, given little, if any, more satisfactory results. It is to be hoped that contentions will induce the Committee whom he addresses to bring his suggestions into operation without delay. The time is opportune, for on November 10 the various Committees have to be re-appointed for the ensuing year. That the matter is an urgent one is shown by the fact that since the date mentioned above the sum of £7,869 has been spent upon repairs and £3,317 upon renewal of track, while more than three-quarters of the track still requires attention. A further idea of the urgency of the problem is afforded by Mr. Moxon when he says that he appreciates "that from the Works Committee's point of view it would not be either satisfactory or desirable that the Tramways Committee should execute repairs to the portion of the roads occupied by the track which necessitates corresponding alterations to the road surface on each side of the track. It is an unfortunate fact that, speaking generally, the then existing levels of the road were adopted as the level of the track when it was first laid, with the result that there are excessive dips in it, preventing smooth running and causing portions of the track to become waterlogged, and its life impaired and shortened. The question of the removal of these dips when the track is reconstructed has to be considered from two aspects—viz., the effect upon the remainder of the road surface, and also the increased cost of maintenance and renewal if the dips are continued." It is only fair to the Works Committee to mention that the statements made respecting the track were considered by that Committee on October 30, when the Committee had the officials responsible for the work before them, and were satisfied that there was no ground for the complaints so far as they are concerned. The Committee, the chairman states, repudiated, therefore, the allegations as to inefficient and faulty work.

## KEEN TRAFFIC COMPETITION IN LONDON.

In our last issue reference was made to the fact that after a long period of decreasing revenue, owing to growing motor-omnibus competition, the London County Council Tramways are now showing increased receipts every week as compared with last year, the increases running up to as much as £2,000 per week. An examination of the weekly traffic returns of all the undertakings devoted to local passenger transportation in London reveals the remarkable fact that at the present time the only agency whose revenues are on the up-grade is the tramways. This improvement, moreover, is not confined to the system worked by the County Council, for most of the tramways round the county of London, whether worked municipally or by companies, now show moderate increases in receipts as compared with the corresponding weeks last year. During last winter and spring three of the underground railway companies associated with the Underground Electric Railways Company of London still recorded increases in their traffic receipts, while the fourth, the City and South London, continued to show decreases. The last-mentioned still falls away, as it is very badly hit both by tramway and omnibus competition. About August last the increases of the Metropolitan District, the London Electric and the Central London Railways began to diminish, and now their returns frequently show decreases in receipts as compared with last year. It is to be noted as peculiar that this decline coincided with the turn of the tide in the tramway receipts. Yet the one

Digitized by Google

fact can hardly be directly connected with the other, because the three railways mentioned are not very much affected by tramway competition. The competition which does affect them is that of the motor omnibus, and in the present irony of fate that vehicle also is controlled by the Underground Electric Railways Company. But another circumstance is worthy of note. In the earlier half of the present year the weekly receipts of the London General Omnibus Company showed enormous advances, owing to the constant increase in the number of vehicles and in the number and mileage of routes over which they run. These increases are now coming near an end, and correspondingly the amounts of the weekly increments in receipts compared with last year are becoming less. The last return showed an increase of less than £2,000. Yet this is the time when the railway returns are becoming less favourable. The reductions announced in fares on the railways will not affect the tramways nearly so much as they will the omnibuses, and it will be very interesting to note the progress of events during the next few months. The most important reductions are on City and South London fares, which have in many cases up till now been on the old basis of a penny per mile. The competition between railway and omnibus promises to be very keen. The public in the meantime at least get the benefit. In considering prospects, the view must probably be that the railways have the stronger position. The omnibuses use an expensive fuel, which is likely to become still dearer. They may be called upon to contribute towards the maintenance of the streets which they use, and to carry workmen at unremunerative fares as the tramways and railways have to do at present. These burdens would be a serious matter for the omnibuses. Then various connecting lines and extensions for the railways are in progress, and these will be of great advantage. Altogether, the advantage seems to be with the railways as against the omnibuses, but the latter have also a big field where railways do not compete. In any event, the tramways have a good prospect of going on comfortably, as it is tolerably clear that the omnibus competition has nearly reached its maximum, and the tramway revenues are going up.

## TRAMCAR AND OMNIBUS INSPECTION.

In the report of the Commissioner of Police of the Metropolis for the year 1912, issued on October 31, it is stated that 249 motor omnibuses were rejected during the year by the Noise Committee, the vehicles not coming up to the standard required in respect to quiet running. Most of them, after the necessary alterations had been made, were subsequently brought up to the requisite standard and passed. The number of cases and the class of vehicles reported for being unduly noisy after being licensed during 1912 were :—Motor omnibuses, 7,677; electric tramway cars, 2,684; and motor cabs, 353; a total of 10,714. This, compared with 1911, shows on the whole a slight decrease, motor omnibuses being 775 less, whilst electric tramway cars increased by 462 and motor cabs by 128.

The total number of licences issued for cabs and stage carriages during 1912 exceeded those issued in 1911 by 81, the numbers for 1911 and 1912 respectively being 16,476 and 16,557. Of this number horse-drawn carriages again show a decrease being 1,402 less than in 1911. This decrease is made up of 487 hansoms, 475 four-wheeled cabs, 410 horse-drawn omnibuses, and 30 horse-drawn tramway cars. Against these decreases must, however, be set a total increase of 1,483 in mechanically-propelled vehicles, made up of 343 motor cabs, 940 motor omnibuses, and 194 electric tramway cars.

In great measure the increase in the number of motor cabs is attributed to drivers procuring their own cabs—generally on a hire-purchase agreement. The increase in the number of motor omnibuses is referred to as showing "that the popularity of this class of vehicle has by no means decreased. This continuance of popularity may also be due to the fact that many extensions of route have been made to places of resort in the outer part of the Metropolis." Among the carriages licensed in 1912 there were 2,363 new vehicles, of which only three were horse-drawn, the remainder being mechanically-propelled. The number of taximeters tested during the year was 24,623, of which 437 were rejected as being unfit from various causes.

During the year under review vehicles of all kinds killed 538 persons in the street—over a hundred more than in 1911. Of these 331 were victims of motor vehicles of various kinds, the deaths of 167 being attributed to the motor omnibus. Tramcars were responsible for only 37 deaths. Motor vehicles of all kinds injured 8,630 people, the motor omnibus being responsible for 2,580. The total number of persons injured by tramcars was less in 1912 than in 1911, while the number injured by motor omnibuses was doubled in the same period. Of the 538 killed in the streets, 273 were between the ages of 15 and 60.

## ELECTRIC TRACTION IN THE UNITED STATES

Highly interesting statistics are published in the "McGraw Electric Railway Manual" (New York) regarding electric tramways and railways in the United States. The totals for the present year show the great development which has been reached by undertakings of the kind. The expression electric railways in America includes electric tramways on streets and roads as well as electric lines on their own right of way. The latter class embraces inter-urban lines, city lines both underground and elevated, and the electrified sections of steam railway undertakings. It appears that there are in the United States 1,115 electric railway companies owning 43,044 miles of track and working 93,946 cars. The total amount of capital stock and bonds authorised is no less than £1,826,330,000, of which the amount issued is £1,117,170,000. Taking the States in groups, the two most important are the Eastern States and the Central States. The former have 396 companies with 12,952 miles of track, and 34,048 cars. The figures for the latter are 321 companies, 15,089 miles of track, and 27,075 cars.

## L.C.C. TRAMWAY MATTERS.

PROPOSED NEW LINES.

At last Tuesday's meeting of the London County Council the Highways Committee reported that they had considered the question of the construction of new tramways in respect of which it was desirable that the Council should seek Parliamentary authority in the session of 1914. The Committee were satisfied that the construction of a number of tramway sections to consolidate and link up the existing system was necessary and closely concerned the future of the tramway undertaking, but the failure which had attended the efforts of the Council in the past to obtain some of these powers made it desirable to proceed with the utmost care. They were now considering the preparation of a comprehensive scheme for the linking up and the extension to approved traffic points of the present tramway system, but it would not be possible, owing to the great amount of work which would have to be done in the matter to present a complete scheme in time for submission to Parliament in 1914, but they hoped to do so for the following session. They were now limiting their recommendations to the following schemes, which were either special in character, or involved little expenditure compared with the advantages to be derived from them. The Committee hoped that the Council would be successful in obtaining the consents of the road authorities, so that the schemes might be considered by Parliament. Practically the whole of the routes would be double track, and particulars of length and estimated cost are as follow :—

(1) From the present terminus in Farringdon Road (Charles Street) to a point near Ludgate Circus *viâ* Farringdon Road and Farringdon Street, 5 fur. 6 chains, estimated cost, £23,820.

(2) From the present terminus at Aldgate to a point near Mark Lane Station *viâ* Mansell Street and Tower Hill, 1 mile 2 fur. 4 chains, estimated cost, £29,135.

(3) From the present terminus at Aldgate to Aldgate Station, 1 fur. 4.5 chains, estimated cost, £5,800.

(4) From Lee Green to Eltham *viâ* Eltham Road and High Street, 3 miles 5 fur. 6 chains, estimated cost, £67,125.

Total length of all proposed extensions in single track, 5 miles 7 fur. .5 chains, estimated cost, £125,880.

The estimates do not include the cost of cars, car sheds, substations, or sites for buildings, as expenditure under these heads is as a rule common to more than one route. The existing car sheds would be utilised. It was accordingly recommended that authority be sought in the next session of Parliament for the construction of these lines.

The Finance Committee stated that they had been informed by the Improvement Committee of proposals to be submitted in regard to street widenings in connection with schemes 2 and 4. The total estimated cost of construction and equipment, excluding street widenings and any proportion of power station expenditure, amounted to £148,530. The estimated cost of the proposed street widenings was £57,700, making a total expenditure of £206,230. The Highways Committee had stated that scheme 4, which involved considerable expenditure on widenings, was required owing to the rapid development of the district and to the need for direct tramway communication between Eltham and other parts of London, and for the purpose of linking up the existing tramways from Woolwich to Eltham with the tramways at Lee Green, thus abolishing two dead-end termini. Though the financial results of working

Digitized by Google

this line were estimated to show a large adverse balance it was considered that the construction would induce additional traffic on adjacent routes for which no allowance was made in the estimate of financial results.

Consideration of the proposals was adjourned.

SUPPLY OF DRIVING WHEEL CENTRES.

The Highways Committee had considered the following tenders for the supply of 200 cast-steel driving wheel centres for electric cars :—

| Price each delivered to | Depots in London | Siding in Truck. |
|---|---|---|
| | £ s. d. | £ s. d. |
| Societe Anonyme Usines et Aciéries Allard, Belgium | 1 4 6 | 1 4 6 |
| Usines Gustave Boel, Belgium .. .. .. | 1 5 2 | — |
| British Griffin Chilled Iron and Steel Co. .. .. | †1 10 0 | — |
| Estler Bros. (Belgian Manufacture) .. .. .. | 1 12 0 | 1 12 0 |
| Soc. Anon. Aciéries et Fonderies d'Art de, Haine-Saint-Pierre et Metallurgique .. .. .. | 1 14 3 | 1 14 0 |
| National Steel Foundry .. .. .. | 1 17 6 | 1 16 9 |
| Fried. Krupp Aktiengeselschaft, Essen-Buhr .. | †2 2 0 less 2½ per cent. | — |
| Hadfield's Steel Foundry Company .. .. .. | 2 3 3 | 2 3 3 |
| Springfield Steel Company .. .. .. .. | 2 6 0 | 2 6 0 |
| John Baker and Co. .. .. .. .. .. | †2 7 6 | †2 7 6 |
| Medway Steel Company .. .. .. .. | 26 10 0 | 26 0 0 |
| | A ton. | A ton. |
| Glasgow Railway Engineering Co. .. .. .. | 2 15 0 | 2 15 0 |
| Hurst, Nelson and Co. .. .. .. .. | 3 2 6 | 3 0 0 |
| Thos. Firth and Sons .. .. .. .. .. | 3 10 0 | — |
| R. B. Tennent, Limited .. .. .. .. | 3 10 6 | 3 10 0 |

† Not to specification.

The Committee had recommended for acceptance the lowest tender, that of the Société Anonyme Usines et Acieries Allard.

Consideration of this report was also adjourned.

ENAMEL FOR PLOUGH BASES.

For some time experiments had, the Highways Committee reported, been carried out with preservatives for treating plough bases in substitution for the compound at present in use, which was affected by heat and was inflammable. So far the most satisfactory results had been obtained from a special heat-resisting grey enamel supplied by Pinchin, Johnson and Company. This enamel was a good insulator, and this property made it still more suitable for the purpose required. Having regard to the good results of the experiments, the Highways Committee were of opinion that it was desirable to treat all the plough bases in use with the enamel at the earliest possible moment, particularly in view of the approach of winter, and they had accepted the offer of Pinchin, Johnson and Company to supply 500 gallons of the enamel at 8s. 6d. a gallon. The Council approved this action.

## NEW TRAMWAY AND RAILLESS PROJECTS.

BOLTON.—Powers to provide and run omnibuses are being applied for by Bolton Corporation.

BOURNEMOUTH.—Next year the Council will make application for powers to extend the tramways in Charminster Road. Consideration is also to be given to the question of extensions in other districts.

BRIERLEY HILL.—The Councils of Brierley Hill and Quarry Bank have agreed to ask Messrs. Balfour, Beatty and Co. to state when they intend carrying out the terms of the order transferred to them for the making of the light railway from Brierley Hill through Quarry Bank to Cradley Heath. There is said to be a great need for the proposed line.

BURLEY-IN-WHARFEDALE.—Leeds Corporation have informed the Burley-in-Wharfedale Council they are applying for powers to run railless trolley cars from Guiseley terminus to Burley.

NORWICH.—The Tramways Company intend to obtain powers for the construction of several tramways in the city and also an extension to the village of Thorpe.

PRESTON.—Application will be made next session for powers to extend the tramways to places inside and outside of the borough, to run motor omnibuses within the borough, and to borrow money for future requirements in the way of additional cars, car shed extension, and additions to the generating station.

SKEGNESS.—Application will be made by the District Council for an Act authorising them to run mechanically-propelled vehicles by means of overhead wires and other apparatus.

SOUTH-WEST SUSSEX.—The Light Railway Commissioners on October 4 held an inquiry at Chichester into the application of the Selsey Tramways Company for authority to reconstruct the existing tramway under the Light Railway Act, and to extend the existing line to the east bank of Chichester Harbour, affording access to the shipping there, and to East Wittering. The latter place is expected to develop in the near future as a seaside resort. At Itchenor it is proposed to erect a jetty, which at certain times could be used by vessels of 800 tons burthen. The Commissioners decided to grant the Order.

SOUTH YORKSHIRE.—Mr. Stephen Sellon, of Westminster, is the engineer to the scheme of joint tramway and electric lighting proposals by the Councils of Wombwell, Wath, Bolton, and Thurnscoe, and Mr. J. B. Hamilton has also been consulted. For the tramway part of the scheme, which relates to a distance of 15 miles, application is being made to the Light Railway Commissioners. On one route it is proposed to obtain powers to connect with High Street, Mexborough, over a portion of the road granted for trackless cars to the Mexborough and Swinton Tramways Company.

## THE LATE BARON ZIFFER.

We record with deep regret the death of Heir Ingenieur Emanuel A. Ziffer, Edler von Teschenbruck, a title with many others he had earned through his extraordinary services as President for many years to the Austrian Union of Tramways and Light Railways and to many of the companies affiliated to it. He was a prolific writer on technical subjects, and was well known to all participants in Tramway Congresses for many years past. He was one of the original members of the Permanent International Tramways Union, and the earnest and enthusiastic way in which he worked in the development and advancement of all light railway and tramway matters was remarkable. His untiring energy never flagged until his last illness, and only recently he was actively pursuing his professional work. He suffered but a short time, and died on October 27 last at his residence in Vienna. He was buried two days later in the central cemetery in the presence of many of his old friends and admirers.

## MISCELLANEOUS NEWS AND NOTES.

**Standing Compartments.**—Bombay City Council have agreed to allow the Tramways Company to introduce two "standing" compartments in its bogie cars for a period of three years from January, 1914, to provide accommodation for passengers during the crowded hours of traffic.

**The Diesel Engine Users' Association.**—A meeting of this new Association will be held on Wednesday, November 12. Any engineer interested in the running of Diesel engines may obtain full particulars as to membership, etc., from the honorary secretary, Mr. A. C. Gilling, Electricity Works, Epsom, Surrey.

**Suggested Linking Up of East London Tramways.**—Stepney Council has decided to urge the London County Council to obtain Parliamentary powers with a view to linking up the tramways north and south of the Thames by way of the Rotherhithe Tunnel, through which, at the present time, there is no passage for the travelling public.

**Through Running from London.**—Bexley Council have authorised their tramways manager to confer with the chief officer of the London County Council tramways with reference to the through running of cars between London, Bexley, and Erith, in place of the present arrangement of the Bexley cars running to Beresford Square, Woolwich.

**An Abandoned Route.**—At the last October meeting of Liverpool Corporation Councillor Blair moved in favour of the reconsideration of the proposal of the Tramways Committee to abandon the Smithdown Road and Park Lane route. The loss on it last year was £411, and so far this year only £170, and the receipts per car mile were higher than on the Wavertree first-class cars. The amendment was lost.

**Preston in Need of Additional Cars.**—Councillor Crompton, chairman of the Tramways Committee, informed the Council on October 30 it was essential that at least six more cars should be purchased in the immediate future. The car sheds would need to be enlarged and the generating plant increased. The reduction of the three-halfpenny fare to a penny on the Penwortham route had been a financial success.

**Rawtenstall Cars and Regenerative Control.**—The Councils of Accrington, Haslingden, and Rawtenstall have agreed to continue the present 10-minutes service of cars from 2 o'clock each day for one year, on condition that the Rawtenstall Corporation will forego its claim for the payment of the difference in current consumption, alleged to arise through the use of the regenerative system of control on Rawtenstall cars running through Haslingden.

**The Henley Wiring System.**—Henley's Telegraph Works Company, Limited, have issued an illustrated price list of wires and accessories dealing with the Henley Wiring System. Special features are the universal bonding clamp, the tee and joint boxes, and the rawplugs. The system continues to meet with favour wherever it is used. Electrical engineers speak highly of it, and it has been installed in practically every type of building.

**Concrete Tramway Standards.**—In reply to a request from Grimsby Urban Council for steel tramway standards to be used at Immingham instead of ferro-concrete pillars, the Tramways Company's engineer has stated that the ferro-concrete pillars had been ordered and the order could not be cancelled. He hoped that the objection, which might be a sentimental one, would be waived. The Council decided to ask the company to erect steel poles in conformity with their agreement.

**Trail Cars Sanctioned for Aberdeen Suburban Tramways.**—Replying to the observations of Aberdeen Tramways Committee in regard to the application by the Aberdeen Suburban Tramways Company for permission to run trailer cars on their tramway lines, the Board of Trade have stated that they see no sufficient reason to object to the use of trailer cars on the tramways as proposed, provided suitable arrangements for turning were made at the Woodside and Mannofield termini.

**Greenock and Tramway Municipalisation.**—At the October meeting of Greenock Council the members by a majority declined to postpone consideration of a motion that the Council should give notice to the Tramways Company to terminate their lease at the first break, namely, May 15 next. Ex-Bailie Mitchell thereupon intimated that he would not proceed with the notice of the motion which he had given to that effect. On November 1 a meeting of ratepayers passed a resolution in favour of municipalisation, but as the result of the municipal election, the advocates of purchase are in a minority.

Digitized by Google

**The Position at Oxford.**—By a small majority the General Purposes Committee of Oxford Corporation have decided to recommend the acceptance of the National Electric Construction Company's scheme for running petrol-electric cars in the chief thoroughfare and overhead electric tramcars and motor omnibuses in the other streets. The company, however, are to be asked not only to reaffirm formally their liability to penalties from August in last year, but to pay over the sums already alleged to be forfeited.

**Municipal Election Speeches.**—The past few weeks brought a flood of oratory dealing with tramways by candidates seeking election at the polls on November 1. The *Yorkshire Daily Observer*, referring to the advocates of halfpenny fares in Bradford says:—"It is idle for a candidate to claim special support from the electors on the mere ground that he favours the cheapening of this or that municipal service unless at the same time he shows that he has considered the practical means of realising the ideal."

**Damages for Ejecting a Passenger.**—In the Court of Session, Edinburgh, judgment was given on October 23 against Glasgow Corporation for £50 as damages to a tramcar passenger. An altercation took place about the car having run past the stopping place, the result being that the driver and conductor unsuccessfully tried to eject him, and later on a policeman was called on to the car, and took his name and address. For the defence it was pleaded that the action of the conductor and driver was justifiable on account of the offensive language in which the pursuer indulged. It was denied that there was any assault. Plaintiff claimed £250, but accepted £50 offered by the Council.

**Single or Double Track at Rotherham?**—On October 31 the Town Council decided that double track should be laid in place of the single track on the Effingham road section. The Tramways Committee advised the relaying of the single line, and that a similar course be followed with respect to the track in Fitzwilliam Road. Alderman Winter, chairman of the committee, who was unable to be present, wrote stating he was of opinion that, considering the present state of the finances of the borough, the Council would not be justified in expending the additional £6,000 required for a double track. By 23 votes to 5 the Council decided upon a double track for this section also.

**Cardiff Employees' Alternative Spread-Over Duties Scheme.**—The Tramways Committee have adopted a proposal to increase the pay of labourers to 6½d. per hour, fitters' helpers 6¾d. per hour, and that the minimum rate of motormen be 6d. per hour, rising by half-yearly instalments of ¼d. per hour to a maximum of 7d. Conductors have an increase of ½d. per hour. The men's union asked that conductors should have another increase of ¼d. next January. The sub-committee contended that this was not reasonable, as it would mean an increase of ¾d. an hour within a period of two months. The scheme of spread-over duties had been revised. The sub-committee mentioned that the alternative scheme put forward by the men's union to eliminate 30 out of the 163 duties required for the Saturday traffic would involve the employment of between 50 and 60 additional men in order to work only a few hours on Saturdays, and the additional cost in wages to those men would amount to between £2,500 and £3,000 per annum. This they could not recommend the committee to agree to. Three representatives of the men appeared before the Tramways Committee, and Sir John Courtis informed them that they were at liberty to see the management at any time, and they were also invited to bring forward any alternative proposals that would not involve the department in great additional expense.

**Unreasonable Attitude of Dundee Tramwaymen.**—Because Mr. Peter Fisher, the tramways manager, is experimenting with a scheme which enables something like a thousand extra seats to be provided for the travelling public at the busy hours of the day, the union employees have passed a resolution generally condemning the proposed new relief table. In a statement which the general manager has issued with the consent of the chairman of the Tramways Committee, he says:—"Under the new system the longest 'spread-over' is 13 hours and 25 minutes, and that only occurring on Saturdays. There are one or two other 'spread-overs' of about 13 hours, but they were for Saturdays also. On another route the 'spread-overs' on Mondays and Thursdays extended to about 13 hours. The Board of Trade have laid it down that an ideal system should provide that no 'spread-overs' exceed 14 hours. The new relief tables have been handed to the men to go over during the next three weeks while they will be on trial. We have asked the men to advise me whether improvements can be effected, and if we find any suggestions they make practicable they will be reproduced." To an interviewer Mr. Fisher said:—"I want to know what it is they want. We have met them on the question of the 'spread-overs.' If they tell us specifically what they want, I have no doubt we will be able to satisfactorily meet them." Mr. Fisher was asked to give a few comparisons of other towns in regard to the extent of the "spread-overs," and from a long list in his possession he took a few towns casually. One town had 265 duties of between 16 and 17 hours and 97 between 15 and 16; another town smaller than Dundee had seven duties with "spread-overs" of between 18 and 19 hours; another 15 duties of 16 and 17 hours.

**Jury's Recommendation in the Tyneside Collision.**—At Wallsend on October 30 the inquest was concluded on the body of William Amis, tramcar conductor, who died as the result of the collision in a fog on October 18 between a trolley wagon containing tramway workmen and an empty passenger tramcar. The driver of the former vehicle said he saw a car six or seven yards from him, and on the same line. He immediately shut off the power, applied his brake and sand, and sounded his gong. He pulled up his car within its length. The cars collided just as they had almost stopped. Witness was travelling at a speed of about eight miles an hour. He did not feel the impact, and he remembered nothing more until he came to his senses while he was still standing on his car. Mr. F. H. Briggs, resident engineer of the Tyneside Tramways Company, said that Linkhorn and Amis were steady and experienced men. He found that the brake had been applied on both cars excepting the hand brake of the trolley car. Sand had been applied by both vehicles. Where there were obstructions to the view of drivers there were indicators at curves between the loops, but on the Gosforth track these indicators were not necessary. A verdict of "Accidental death due to a collision in a dense fog" was returned, and the jury recommended that indicators be placed on all single lines between loops throughout the system.—On November 3 the inquest was concluded on the body of Robert Walton, a motorman, who was killed in the collision. The jury returned a verdict of "Accidental death," but considered that the driver of the repair tramcar deserved censure, because of his mistake in supposing the single line would necessarily be clear. The jury considered that both cars were being driven too fast considering the foggy weather.

## CONTRACTS AND ORDERS.

**Chamberlain and Hookham, Ltd.,** have received a contract for meters from Ipswich for 10 amperes and upwards.

**London County Council** have accepted the tender of Charles Wall, Limited, Chelsea, for the erection of the third section of the tramway central car repair depôt at £25,690.

**W. A. Stevens, Limited,** Victoria Street, Westminster, have supplied a petrol-electric omnibus to Leeds Corporation tramways. It has been placed in service between Moortown and Shadwell.

**J. G. White and Company** are carrying out the construction of the electric tramway and lighting systems in Pernambuco, Brazil, for Dodsworth and Co., of Rio de Janeiro. English cars will be used, but the power plant and the rails are of American manufacture.

**The Tudor Accumulator Company, Limited,** recently added six plates to each cell of the battery at Pontypridd generating station. Mr. J. E. Teasdel, the engineer, in reporting on the work stated that the battery was on load again on the fourth day, and that in view of the heavy demands it was a good thing that they were able to get the work done so expeditiously.

**London County Council** have accepted the following tenders:—A. and F. Manuelle and John Fyfe, Limited, 275 tons each of Aberdeen granite paving setts, at 36s. 0d. a ton; A. and F. Manuelle, 150 tons of Guernsey granite paving setts, at 35s. a ton; Pinchin, Johnson and Company, 500 gallons of heat-resisting grey enamel for plough bases, 8s. 6d. per gallon.

**Manchester Corporation** have approved of the following tenders:—E. Green and Sons, Limited, renewal and replacement work to economisers at Bloom Street Station; British Thomson-Houston Company, Limited, the Brush Electrical Engineering Company, Limited, and Siemens Bros. Dynamo Works, Limited, requirements of lamps during the period ending June 30 next; Ferranti, Limited, h.t. switchgear; Johnson and Phillips, Limited, cable.

## PERSONAL.

**Mr. C. B. Cripps** has resigned his position with the London County Council tramways department to take an appointment under the Aldershot District Council.

**Mr. R. W. Smith-Saville,** borough surveyor and engineer to Darwen Corporation, has delivered a striking address as president of Darwen Literary Society.

**Councillor A. Sinclair,** chairman of the Swansea Electric Lighting and Tramways Committee, was re-elected to the Council on November 1. He has seen sixteen years' service.

**Mr. S. C. Marengo,** sub-manager of the Buenos Ayres and Pacific Railway Company, has, says the *Review of the River Plate*, resigned that position, having been appointed general manager of the Central of Buenos Ayres Railway Company and the Lacroze Tramways Company.

**Motorman Gamble,** of the Birmingham tramways, has been presented with a guinea at a meeting of the Tramways Committee by the Lord Mayor, who complimented him for a plucky act. A little girl ran in front of his car, whereupon Gamble applied the brakes, but realising that it was not possible to stop the car in time he jumped off, and dragged the child away just in time to prevent an accident. Gamble himself ran considerable risk, and he received a slight injury. The matter was reported to the trustees of the Carnegie Hero Fund, but they are reluctant to intervene in the case of a municipal employee, believing that the municipality should make the acknowledgment of such acts of courageous conduct.

**Councillor Rodgers,** chairman of Newcastle Tramways Committee, is being nominated for a vacant seat on the aldermanic bench on Monday next, after 19½ years' service as a councillor. In addressing a meeting on November 5 Councillor Rodgers said the tramways carried the population four times over per week, which was done by no other city with the exception of Glasgow. They had taken £2,014 on the Westerhope 'buses, and had carried 227,665 passengers. The omnibuses had also proved an admirable feeder to the cars, and the routes concerned had shown increased receipts by £20 a week. Although to concede halfpenny fares at present would do away with the profit on the tramways, such fares would ultimately come, although not before a lot of the present debt on the system had been cleared off.

**Mr. Vincent Edwards,** assistant engineer and manager of the Hastings and District Tramways Company, in the unavoidable absence of Mr. T. B. Holliday, the engineer and manager, discharged the task of thanking the audience and artistes at an entertainment given in aid of the widow and children of a motorman who had died suddenly. The concert resulted in a balance of £75 being raised.

**Mr. Charles Vernier,** the new chairman of the Newcastle-on-Tyne local section of the Institution of Electrical Engineers, is 36 years of age. Before taking up his present position with the Newcastle-on-Tyne Electric Supply Company he was from June, 1899, to the end of 1900 an assistant engineer of the Cork Electrical Tramways and Lighting Company. He received this appointment from Mr. Charles H. Merz, who was then chief engineer to the company.

**Mr. F. H. Corson,** who, as already announced, has been appointed manager of Gloucester tramways while retaining his position as borough electrical engineer, was highly spoken of by the Electricity Supply and Light Railways Committees in the joint report in which they recommended the appointment. The report pointed out that Mr. Johnson, the late manager, was in receipt of a salary of £350 a year, and Mr. F. H. Corson, who had been engineer and general manager of the electricity works since 1909, received £400 per annum and was allowed to take one pupil. Mr. Corson had rendered most efficient service in connection with the electricity undertaking, and was well qualified to undertake the general management of both undertakings. He was willing to undertake the dual duties subject to the appointment of a traffic manager under his supervision and control. The committees also advised that the track repair and maintenance should be entrusted to the Streets Committee, subject to the adjustment of expenses, and that the electricity and light railways undertakings should be placed under the management of a single committee.

## FINANCIAL REPORTS AND MEETINGS.

**New St. Helens and District Tramways Company.**—The net profits for the year ended June 30, including £901 brought forward, were £4,422. There has been transferred to the reserve £1,000, and a dividend of 2½ per cent. has been declared on the preference shares, leaving arrears of 50½ per cent., and £1,424 carried forward.

**Norwich Electric Tramways Company.**—The Hon. Arthur Brand, who presided at the 17th annual meeting on October 29, remarked with pleasure on the facts that the tramways had done better than in the previous year, and that there had been a very considerable increase in the earnings. He mentioned that it was intended to promote a Bill in Parliament to make further improvements in the system. A dividend of 3 per cent. for the year was sanctioned. Mr. Chamberlain was re-appointed representative director for the city of Norwich, and Mr. Hopkins, retiring director, was re-elected.

**A Rating Question at Salford.**—In an appeal heard at Salford Quarter Sessions against the assessment of the tramways in Eccles, at the instance of Salford Corporation, the Court decided to treat the tramways in Eccles as an integral part of the whole system in considering what a hypothetical tenant would look at in dealing with the tramways. Therefore they dismissed the appeal with costs. Mr. Sutton, on behalf of the appellants, asked the Court to state a case, but the application was declined, the chairman remarking that the decision was based on a question of fact and not of law.

**The British Electrical Federation.**—The traffic statement for the week ended October 31, 1913, shows that the receipts from tramways and railways amounted to £38,701, as compared with £36,403 in the corresponding week last year, and from omnibuses £12,240, as compared with £1,337, making a total of £50,041, as compared with £37,740. The tramway and railway route mileage was 420.82, as compared with 428.47. The Federation now have 514 omnibuses, an increase of 422 within the year. Upon such of the services as were working both last year and this year, the receipts show an increase of £2,029 upon the week.

**Cape Electric Tramways Company.**—At the annual meeting of the Cape Electric Tramways, Limited, held on November 5 in London, Mr. Ludwig Breitmeyer, who presided, said that the twelve months under review had shown a steady expansive development in regard to their systems at Cape Town and Port Elizabeth. Last year they had increased their passenger traffic by nearly 1,000,000, and their receipts by about £8,000 beyond the figures of the previous year. This year these figures had again been topped, inasmuch as they carried about 1,500,000 more passengers, with an increase in receipts of about £12,000. Up to now the first quarter of the current year showed an increase in receipts of £2,000 as compared with the same period in 1912, and he had every reason to anticipate that such proportionate increase would be maintained. The report was adopted, and a dividend of 5 per cent. on the ordinary shares was declared. The chairman mentioned that Greater Cape Town had now been brought into being. Sufficient knowledge had been gained to convince the board that for a regular town service motor omnibuses were not required. The service to the docks, where the company possessed no tramway, had shown poor results, and would be discontinued if it were not better patronised. So far as they could see, however, motor omnibuses answered well in suburban districts as feeders for the tramways, and also for pleasure traffic on certain routes round the Peninsula.

*(Continued from page 398.)*

**ASSISTANTS.**

Required Assistants, with thorough experience of street passenger-carrying traffic; should be men with decided organising ability and initiative and competent to deal with traffic problems without supervision. Write, stating age, experience, and salary expected, to Box 4801, Willings, 125, Strand, W.C.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 60 of the principal undertakings of the United Kingdom for the week ended November 1 amounted to £226,804, or £13,602 more than in the corresponding week last year, while the track mileage was 2,802, or 80 more than for the corresponding week. The receipts were at the rate of £79 4s. 11d. per track mile, an increase of £2 11s. 8d. per mile as compared with last year.

## COPPER AND ALUMINIUM MARKET.

November 7, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton :—

THE Tramway & Railway World
WITH MOTOR TRAFFIC SECTION

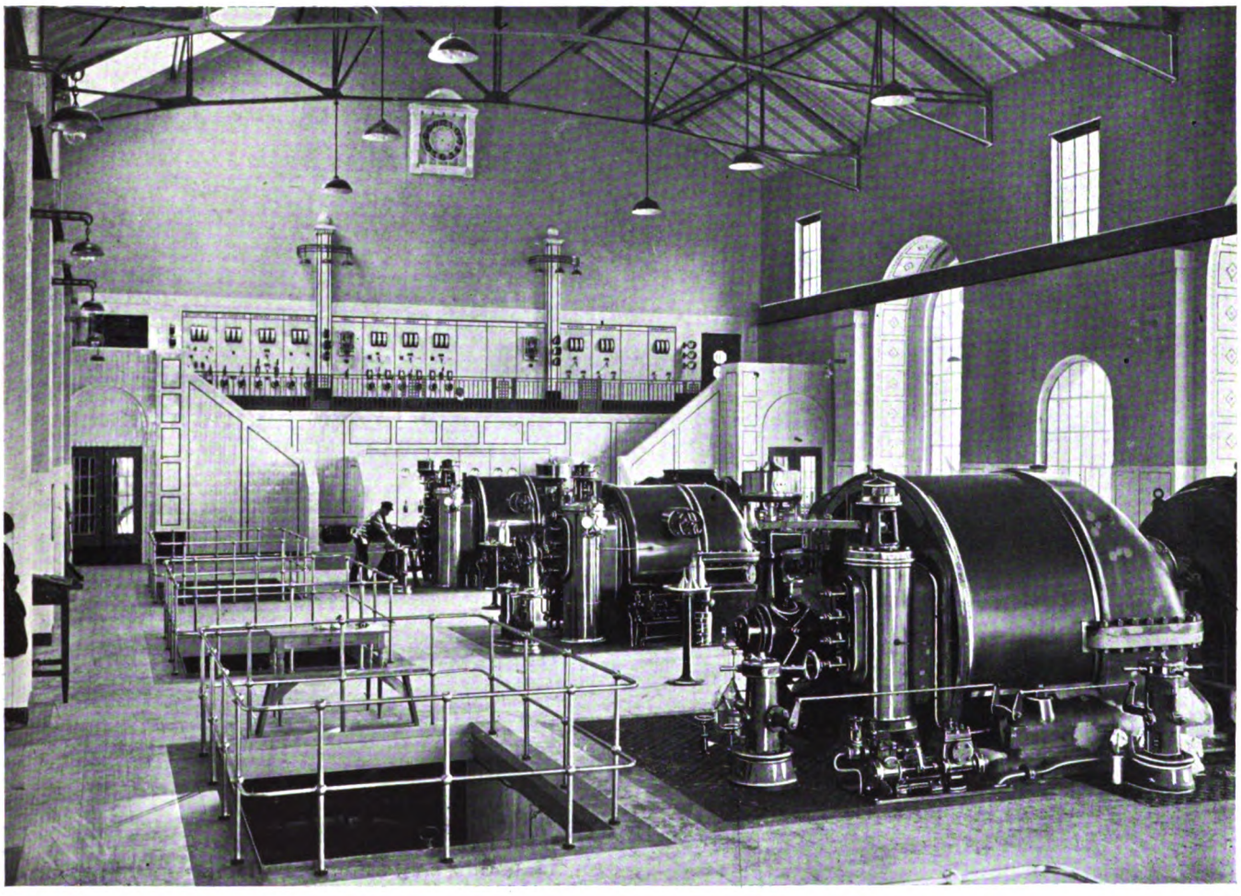
ESTABLISHED 1892. LONDON, NOVEMBER 13, 1913. VOL. XXXIV.

# THE HAMBURG OVERHEAD AND UNDERGROUND RAILWAY.

## GENERAL FEATURES AND CAR REPAIR PRACTICE.

On March 1, 1912, the Hamburg Hoch und Untergrundbahn (Elevated and Underground Railway) placed in operation the first link of a non-surface electric railway of most advanced character. The initial section comprised a route length of 4·03 miles from the heart of the city, Rathausmarkt, to the suburb of Barmbeck, at which point the power-station and car maintenance buildings of the system are located. The line as completed on June 29, 1912, consists of 10·85 miles of double-track in the form of a belt around both Alster Lakes. Of the three branches planned, those to Ohlsdorf and Eimsbüttel, respectively 3·1 miles and 1·6 miles long, will be completed in 1914, while a two-mile line to Rotenburgsort is to follow later.

The physical construction of the new system is of the most massive character, and the viaduct sections, stations, entrance stairways, etc., are unexcelled for beauty of execution. The maximum gradient does not exceed 4·9 per cent. and the curvature a radius of 233 ft. Current is taken by way of a wood-encased contact rail.



Interior of Power-Station - Hamburg Overhead and Underground Railway.

The system was constructed jointly by the Allgemeine and Siemens and Halske Companies, which formed a special organisation, termed a "Bauverwaltung," for that purpose. The State of Hamburg receives defined shares of the gross receipts from the several classes of tickets, and becomes owner of all right-of-way and stationary equipment after 40 years.

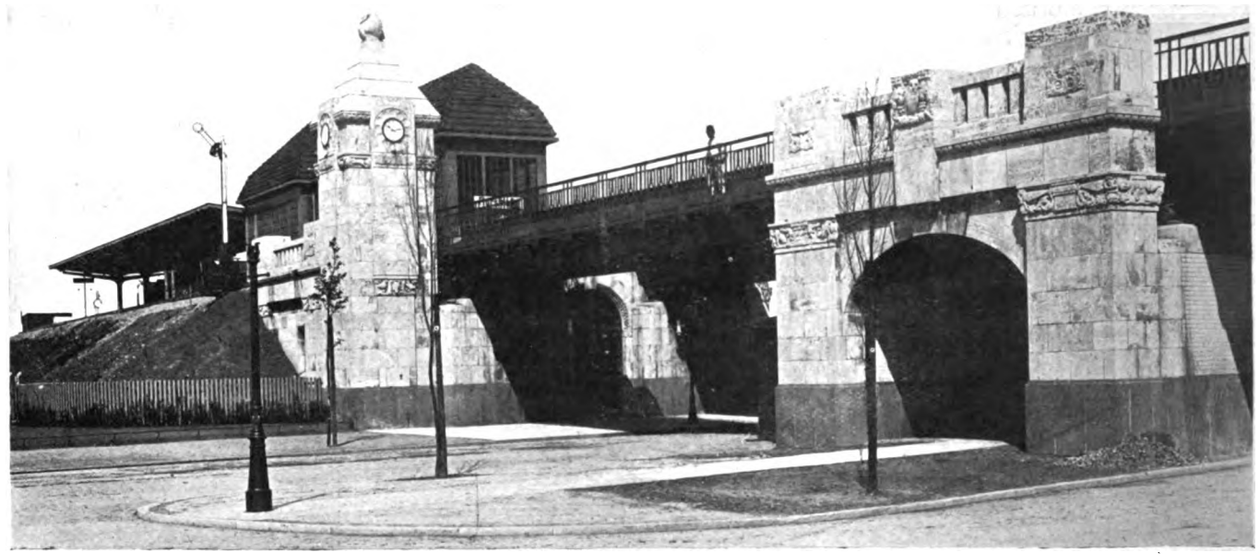
That the new service is very popular appears from the fact that the average daily travel now exceeds 100,000 passengers, and on Easter Monday, March 24 last, about 200,000 passengers were carried in only 76 cars, the remaining four being in the shops. In fact, the increase in traffic has already necessitated an order for 50 more cars, while the present generating equipment of one 4,000-KW. and two 2,000-KW., 6,000-volt, 50-cycle, three-phase turbines is to be reinforced by a fourth machine of 6,000-KW. output.

The popularity of the new service may be ascribed in large measure to the high train speeds. Every car, which weighs 24 metric tons empty, and about 30 tons loaded, is equipped with two 100-H.P. 800-volt continuous-current commutating pole motors, and as motor cars only are employed, the very high rate of acceleration of 1·5 miles per hour per second is readily attained. The maximum possible speed of the two-car and four-car trains in service is 37·2 miles an hour, the permissible speed 31 miles an hour, and the schedule speed, with 23 stations spaced about 2,500 ft. apart, 17·68 miles an hour. The station stops are very short, namely, 15 to 18 seconds.

Hauptbahnhof Tunnel Station.

the ring. Second and third-class fares obtain, but as the former class has 25 per cent. of the seating capacity, and only 12 to 15 per cent. of the business, this division is not considered a financial success. The minimum fares, good for five stations, are 1·25d. (10 pf.) third-class, and 1·875d. (15 pf.) second-class. Workmen's two-way tickets at one-way prices, and season tickets are also sold.



Flurstrasse Overhead Station—Forming Ornamental Gateway to Public Park.

It should be added that only one-half the trains negotiate the complete belt, the arrangement being such that a 2½-minute service is given over the busy section, and a 5-minute service over the outer part of the ring.

Curve Approaching Rodingsmarkt Station.

### The Car Sheds and Shops.

The car sheds and shops of the company at Barmbeck are good examples of the best Continental practice. As they are intended to harbour and maintain in good condition high-voltage equipment, which is subjected to hard service throughout a long working day, no effort was spared to attain this end. The present installation comprises a car shed just enlarged from four to six four-track bays, each track serving four cars, a repair building containing every facility from the smithy to the paint shop, and an intermediate transfer table 33 ft. wide, whereby cars are shifted from the sheds to the shops and *vice versa*.

Two conspicuous and commendable features of both buildings are their fire-proof construction and the great proportion of natural lighting area. The walls are of steel and 15 in. red brick, with steel truss and concrete block roof with continuous type longitudinal skylights, except that the crane-run in the truck overhauling shop called for a transverse skylight, and that small individual

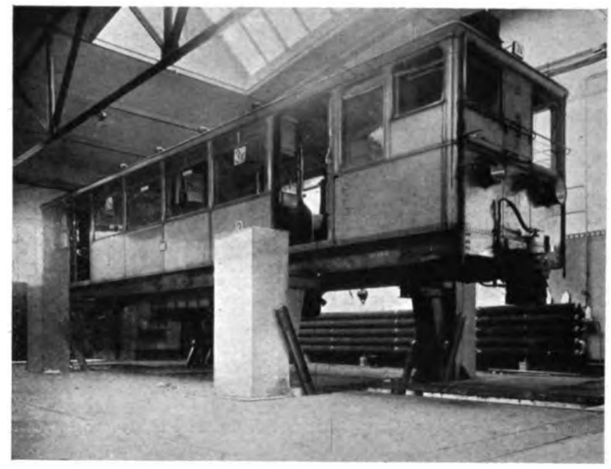
Interior of Truck Repair Shop—Machine Section on Right and Car Body Section on Left.
HAMBURG CAR DEPOT AND REPAIR SHOPS.

Digitized by Google

skylights are used for the more isolated shops. The desire for a maximum amount of daylight has been carried so far that the outside wall of partitioned sections, like the carpentry shop, is glazed almost from the floor level to the ceiling. Glass is also used in the upper panels of the swing-type track doors. A decorative feature common to both buildings, and one eminently characteristic of the Germanic spirit for neatness, is the application of painted and stencilled borders to form a wainscoting about 7 ft. high along the walls. Another instance of the desire for spotless appearance is the use of fully-inclosed cleansing rooms to avoid spattering grease and dirt on the exposed walls and floor. Even the fire hose is kept in dust-proof glass-framed cases. That the discipline of the German army extends into the private workshop is shown by the fact that a group of employees have been trained to fight fires, and that a system of alarm signals has been drawn up in connection therewith.

As the car sheds primarily are not storage but operating structures their tracks have been provided throughout with pits of open type 4 ft. 11 in. deep. These pits are heated by radiators supplied with exhaust steam from the adjoining power-station. Sockets for incandescent lamps are installed in the pits at frequent intervals, but the lamps themselves are attached only when light is actually needed for the work in hand. The aisles between the tracks are paved with hard-burned brick and are of liberal width, 8 ft. 6 in., so that ladders for window cleaning and other purposes may be placed against the cars without obstructing passage. Instead of taking car-flushing water from the fire lines, separate standpipes with twin outlets are used. These outlets are situated between the pits, and when not in service they are concealed by hinged covers.



Electrically-Worked Car Hoist—Hamburg Shops.

As a third-rail installation was impracticable for moving the cars in the shed, it was necessary to devise a simple form of connection between the collector shoes of the cars and a light overhead conductor, which is suspended from the roof trusses over the centre line of each aisle. This connector consists of a wooden pole with cable runway, the lower end of the pole carrying a brass lug which fits a recess in the car shoe whilst the upper end has a V-shaped groove to fit the conductor. The tension of the car shoe has been found sufficient to insure good contact for current collection.

Like the car shed facilities, the repair shops were laid out for expansion, but it is not likely that anything will be done in that direction for some time owing to the splendid behaviour of the car equipment. The electrical shop, for example, has not yet been obliged to handle a burn-out of any kind, although the motors are operated at 800 volts, continuous current.

The general plan of the repair shop, which measures 260 ft. 8 in. width by 201 ft. 2 in. depth, is that of a great central area 135 ft. 9 in. by 56 ft. 7 in. for the heavy car body repairs, truck overhauling, and the heavier machine tools, but partitioned rooms are constructed at the sides and rear as store room, smithy, paint shop (with two independent track entrances *via* the transfer table), woodworking shop, electrical shop, workmen's dining room and toilet, etc. About one-half of the length of the eight tracks in the centre area is devoted to car body repairs, and the other half, which is nearer the machine tools, to truck overhauling.

All car floor repairs are handled on one track, which is equipped for that purpose with a screw-type hoist. This hoist is driven by a 7½-H.P. motor, and can raise a 20-ton body at the rate of 0·18 in. per second. The 7½-ton crane which spans the truck overhauling shop has a runway which enables it to transport heavy parts to every section where large masses of metal are employed. A second crane, but of 5 tons capacity, and comprising a hand-hoist and electrically-operated bridge, serves the machine shop alone. Material from the store room is conveyed to the 7½-ton crane of the overhauling shop by means of a hand-operated telpher.

The machinery installed in these shops is of the widest range, so that the management can undertake practically every class of car and equipment reconstruction.

In addition, there are several contrivances and practices to be noted which are more or less original to this installation.

Particular interest attaches to the method of cleaning trucks. These are stripped of their electrical fittings and journal boxes, after which they are carried by the 7½-ton crane to the open top of a special chamber, which is usually isolated from the rest of the shop by a cement-covered steel door of sliding type. Here the stripped trucks are plunged as long as need be into a vat containing a caustic soda solution of boiling water. A smaller vat serves for the similar treatment of motor shells and smaller metal parts.

A second chamber of similar construction, supplied with a compressed air line and exhaust, is in use for blowing out motors, individual armatures, and the like, so that dust and filings cannot find their way into the open shop.

As the Hamburg undertaking proposes to make its own electrical renewal parts, it has installed a Passburg equipment for the vacuum impregnation of coils.

An unusual feature is that the impregnation tank has been set below the floor level.

Owing to their size, the traction motors are necessarily of solid frame construction, as split frames for this capacity could not be handled in a pit. For the removal of defective armatures, the shop forces have devised a combination of a fixed motor stand and a carriage which carries a ram to fit into the end of the motor shaft. After the motor has been placed on the stand by the crane, its end pieces and bearings are removed, and then the ram carriage is pushed by hand along its track until the armature has been forced out of the frame. It may then be readily inspected, since it is supported at its outer end by a stand which is fixed to the carriage. When an armature is to be replaced in the motor, it is necessary only to roll the carriage back to its original position. It is evident that this procedure could be hastened by using a pneumatically-operated ram, but man-power is deemed sufficient in view of the small amount of armature work likely for some time.

With the exception of the gas ring equipment for expanding tyres and for soldering, all work is done by electricity either directly or indirectly. Thus the compressor which supplies air for blowing out motors and for other shop work also supplies power for the operation of a hammer in the blacksmith shop. All motors are operated on three-phase current. The gas outfit just mentioned is similar to that of the London electric railways. It is not likely to see much service for some time, as up to February 15, 1913, the first steel-tyred wheels had run more than 100,080 km. (62,000 miles) without showing any need for early replacement.

In conclusion, a few words concerning the conveniences for the shop workers will not be out of place. Ample space has been provided with separate steel lockers for clothing, toilet room with high-grade sanitary plumbing and tiled floor, shower baths, dining room, and a completely equipped kitchen, where the men are welcome to prepare their food in accordance with their desires. It is apparent that these facilities are appreciated, and that they do much to make the men take greater pride in maintaining the *esprit de corps* of these shops.

**Overhead Roads at Barmbeck Station, Showing Arrangement of Signals—Hamburg Railway.**

## LONDON AND SOUTH WESTERN RAILWAY ELECTRIFICATION.

BEGINNING OF THE WORK ON THE SUBURBAN LINES.

Work on the line, in connection with the London and South Western Railway Company's scheme of electrification of their suburban lines, which was briefly outlined in our issue of December 12, 1912, was commenced at the end of October at Teddington. Work on the power-station, which will be situated at Wimbledon, immediately to the east of Durnsford Road sidings and adjacent to the main line, is well advanced. The outer wall is completed up to ground level, and the foundations for the chimney stacks are finished. The foundations will be sufficiently far advanced for the erection of the steel structure to be commenced at the end of this year. The building will consist of two main bays forming a boiler house and turbine house, with a switch house attached, and will be 260 ft. long by 210 ft. wide. There will be two chimney stacks at the west end, each 236 ft. high, and 13 ft. 6 in. internal diameter. A line will be constructed and carried on a viaduct from a point near Durnsford Road bridge, up into the roof of the boiler house, from which coal may be dumped from wagons direct into bunkers over the central firing floor.

When completed the boiler house will contain 24 boilers, each capable of a normal evaporation of 20,000 lb. of water per hour, and supplying steam at a

Digitized by Google

pressure of 200 lb. per square inch, and with a superheat of 200 deg. Fahr. Coal from the overhead bunkers will descend through shoots into mechanical stokers driven by electric motors. Economisers will be fixed in the main flues for heating the boiler feed water.

The turbine room, when completed, will contain six steam turbines coupled to 5,000-KW. three-phase alternators, which will run at 1,500 revolutions per minute, and will generate current at 11,000 volts. There will also be two auxiliary steam turbines coupled through gearing to 400-KW. direct-current dynamos for supplying power for the power house lights and auxiliary motors. The switch house will have three floors, and will contain all the switch gear for controlling the main generating plant and the outgoing feeders. The main oil switches will be controlled from a desk erected on a balcony on the first floor overlooking the turbine house, and will be electrically operated.

Below the turbine house there will be a basement which will contain surface condensers, with the necessary air and circulating pumps, together with 10 hot wells and boiler feed pumps. A 40-ton overhead electric travelling crane will span the turbine room.

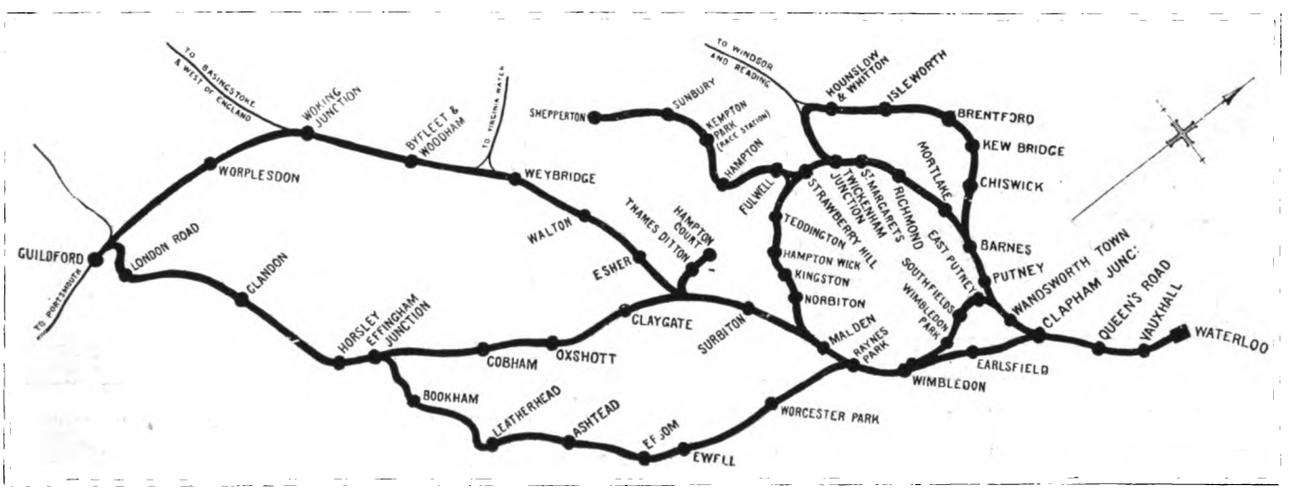
The current generated at 11,000 volts at the power house will be transmitted to nine sub-stations by three-core cables. These cables will be paper insulated, lead sheathed, and wire armoured. They will in most cases be supported on posts beside the line, and will be so arranged as to afford a duplicate supply to all sub-stations. These latter will be erected at Waterloo, Clapham Junction, Raynes Park, Hampton Court Junction, Barnes, Twickenham, Kingston, Sunbury, and Isleworth. The buildings, with the exception of that at Clapham Junction, will be 50 ft. wide and from 65 ft. to 103 ft. long, and will consist of a machine bay and a switch gear bay. At Clapham Junction the sub-station will be located on No. 5 platform under the gangway leading to St. John's Hill, and this site will require a special arrangement of buildings and apparatus.

Each sub-station will contain static transformers and rotary converters, together with the necessary switch gear, for transforming the three-phase high-tension current to direct current at 600 volts, in which form it will be used by the trains. Two sizes of converters will be used, the larger, having a continuous capacity of 1,875 KW., at Waterloo (4), Clapham Junction (3), Raynes Park (2), Barnes (2), and Twickenham (3), and the smaller, having a continuous capacity of 1,250 KW., at Hampton Court Junction (2), Kingston (2), Sunbury (2), and Isleworth (2).

From the sub-stations, direct current at 600 volts will be delivered to a conductor rail which will be laid along the line 16 inches from gauge and at such a height that the contact surface will be three inches above rail level. The rail, of which considerable quantities have been delivered, is of special steel, having a resistance of about 6¾ times that of copper of the same length and cross sectional area, and weighs 100 lb. per lineal yard. It will be supported by insulators fixed on the sleepers, and will be bonded across the joints by four flexible copper bonds expanded into holes drilled in the rails before delivery. Current will be collected from the rail by the trains by means of cast-steel collector shoes hung from the trucks, and the return side of the circuit will be formed by the running rails, which will be bonded across the joints by two flexible copper bonds.

For the first section of the electrified lines, 84 train units are being provided. Each unit will consist of three compartment type coaches and will be equipped with four motors, each of 275 H.P., together with the necessary control apparatus. These motors will be the largest ever mounted on a passenger coach.

A special motor truck, carrying two motors, will be fixed under each end of the train unit, the remaining trucks being of the company's standard pattern. The control apparatus will be of the relay automatic multiple-unit type providing for uniform acceleration, and controlling from the front driving cab all the motors on a train of any length. Every train unit will have a driving cab, containing control apparatus for two motors, at each end, two luggage vans, and seating accommodation for 190 passengers.



**London and South Western Railway Electrification.**

It is the intention to commence electric working on the Kingston roundabout line first, and it is hoped that this line will be in operation before the end of next year. Electric services on the Hampton Court and Shepperton branches and on the Hounslow loop line will be added as soon afterwards as possible.

The work on the permanent way is being carried out under the direction of Mr. J. W. Jacomb Hood, the company's chief resident engineer, and the electrical work is in charge of Mr. Herbert Jones, the company's electrical engineer. The new rolling stock is being constructed at the Eastleigh works under the direction of Mr. S. Warner, carriage and wagon superintendent. Electrical equipment for the 84 train units is being supplied by the British Westinghouse Electric and Manufacturing Company. The entire scheme is under the supervision of the general manager of the London and South Western Railway, Mr. H. A. Walker.

# THE CORROSION OF TRAMWAY RAILS.

By Robt. B. Holt, A.M.I.Mech.E.
*(Permanent Way Engineer, Leeds City Tramways).*

The writer has drawn attention, from time to time, in this journal, to various causes resulting in rail wear. These may be recapitulated as follow: The speed and weight of the cars, the density of the car service, the design of the rails and the quality of the rail steel, and the nature and weight of the ordinary street traffic. In addition to these more important causes, the rate of wear is undoubtedly influenced to a considerable extent by the frequent use of the brakes and brake sand, the proportion and extent of the gradients, the condition of the wheel tyres, the cleanliness of the rails, and, to a varying extent, by the corrosion of the rail steel. The regular gauging of rails, in all positions, indicates that the rate of wear increases rapidly with the speed of the cars, and that speed is far more destructive to the rails than traffic density; unfortunately it is not possible to express the ratio of the wear in terms of either the speed of the cars or the traffic density on account of the variations caused by the presence or absence of any of the above-mentioned supplementary factors. By observing tracks where the conditions, excepting speed, are almost identical, the writer has noted in several instances that the number of cars carried on tracks where the speed has not exceeded 10 miles per hour has been double that on tracks over which the cars run at 15 miles per hour and upwards. It is also a notable fact that the wear of rails is more regular where the ordinary street traffic is of a light order. Again, as the writer has shown in previous articles (and as illustrated in Fig. 1), there are numerous instances on the larger tramway systems where the rails have become worn out without ever having been run over by the tramway cars; such wear being almost entirely due to the ordinary street traffic.

To turn to the question of rail corrosion, this would appear to be more likely to take effect in damp situations, where the rails are alternately wet and dry, and subjected to an infrequent service of cars. It has been suggested, and with very good reason, too, that the impurities deposited from the atmosphere in many of the great industrial centres may have a deleterious effect on the rails, and in conjunction with this suggestion, the nature of the road mud should receive due consideration, particularly where there is considerable cartage of trade wastes, which drain from the carts on to the track surface.

On railways the rails deteriorate more rapidly in tunnels than in the open air, on account of the presence of sulphurous gases from the locomotives, and to the moisture which is generally percolating through the walls, the corrosion taking effect over the entire rail-section. In a paper on the "Wear of Steel Rails in Tunnels," presented to the Institution of Civil Engineers in April, 1900, Mr. Thos. Andrews states that in one tunnel 3,000 ft. long the average loss in weight of rails from corrosion and wear was 2·8 lb. per yard, as compared with an average annual rate of ·324 lb. per yard for rails under the same volume of traffic in the open air.

In a discussion on a paper by Mr. G. Lawford, "The Maintenance of Permanent Way Exposed to the Sea," read before the Permanent Way Institution in 1909, it was stated by Messrs. G. Lawford and Fletcher that there is rapid deterioration of rails, fish plates, and bolts, due to corrosion, when exposed to moisture-laden sea-winds. On one particular length of line referred to, the life of the rails is five years less than on other parts of the same line which are not so exposed. According to Mr. Fletcher, similar lengths of rails on the North Eastern Railway are so corroded that the web of the rail is reduced in places to ⅛ in. in thickness, and the whole of the surface of the rails exposed to the north-easterly winds, is pitted to an alarming extent (see Fig. 2). It is stated that "this pitting can only be detected with difficulty, except when the rails are wet," and also that the deterioration is almost entirely on the rail which first catches the sea moisture-laden winds. The pit marks are said to be "in clusters, and to be for a long time covered up with a cake of rust, which, when it falls away, reveals a black carbonised blotch on the rail which quickly becomes coated again."

In a paper contributed to the Journal of the Tramways and Light Railways Association by Mr. W. Thom, general manager of the Potteries Tramways, the author draws attention to the fact that the wear of the rails is not directly proportionate to the number of cars which have passed over the rails, and he suggests that the bulk of the extra wear is due to corrosion, and that the difference in the speed of the cars may be ignored. From measurements which Mr. Thom has taken, he infers that the wear due to the passage of

Fig. 1.—Wear of Tramway Rail Entirely Due to Ordinary Street Traffic.

Fig. 3.—Runnels of Liquid Between Coal Stack and Rail.

Fig. 4.—Corrosion of Rail Tread when Liquid Flows into Groove.

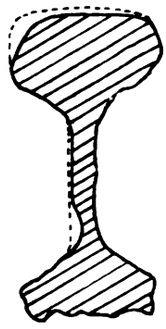

Fig. 2.—Corrosion of Rail Exposed to Sea Water.

Digitized by Google

10,600,000 car tons is ·2279 in. and the loss of metal due to corrosion during the same period is ·0846 in. To Mr. Thom is due the credit for being the first to attempt to express the rate of corrosion in proportion to the number of years the rails have been in service, but it is improbable that the loss of metal can be satisfactorily accounted for in this manner. As the present writer has indicated, the speed of the cars, the quality of the rail steel, the nature and amount of the ordinary street traffic, etc., are all factors of primary importance, and their effect on the wear of rails is too far-reaching to be ignored. The writer has

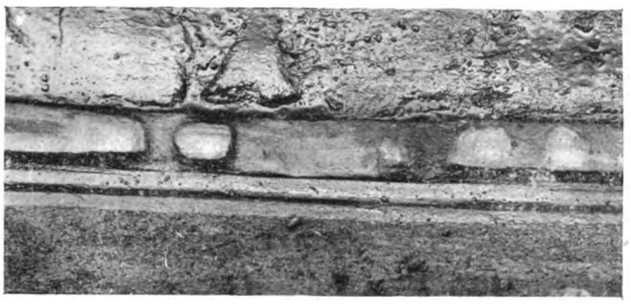

**Fig. 5.—Corrosion of Rail Tread when Liquid Flows into Groove.**

ascertained from collieries and steelworks that the rails in sidings near to deposits of coal and coke, and those carrying wagons dripping with moisture from these materials, corrode much more rapidly than other rails in the same sidings that are not so exposed. The writer has been observing for a considerable period the effect on the rails of the sipe water from a large stack of coal in the tramway permanent way depôt, Leeds. This coal has been stacked to an average height of about 11 ft.; rain water is absorbed and is afterwards discharged in the form of small runnels of a light brown coloured liquid, which drain into the tramway rails surrounding the stack.

There are two varieties of steel in the track which has received this discharge for a period of 18 months, viz., ordinary basic Bessemer steel and Sandberg basic Bessemer steel. The former variety has corroded away rapidly at each place where the liquid has flowed over the rail tread, as shown in Figs. 3, 4, 5, and 6. The depth of the corrosion varies: in a number of places it exceeds $\frac{1}{4}$ in., with variations in width up to several inches, as may be seen in the photographs. The liquid has attacked the Sandberg steel also, but to a far less extent, the maximum depth of the corrosion not exceeding $\frac{1}{64}$ in., and at the same time there are no indications of irregular pitting. The loss of metal is uniform, as shown in Fig. 6.

The analysis of the liquid is as follows:

| | |
|---|---|
| Water .. .. .. .. .. | 96·41 per cent. |
| Ferric sulphate .. .. .. .. | 2·27 „ „ |
| Ferrous sulphate .. .. .. .. | 0·85 „ „ |
| Calcium sulphate, etc. .. .. .. | 0·47 „ „ |
| | 100·00 per cent. |

NOTE.—The analysis shows this to be a dilute solution of the sulphates of iron, probably formed by the oxidation of the iron pyrites in the coal.

(Signed) THOS. FAIRLEY, *Analyst.*

This case is an exceptional one, of course, but it clearly indicates the susceptibility of ordinary rail steel to corrosive influences, and as there are many indications of corrosion and pitting to be observed on tramway rails, it is evident that the question of rail corrosion will have to receive more attention in the future.

## BRILL 39-E BOGIE TRUCK.

The views on the following page show the J. G. Brill Company's latest 39-E patented bogie truck, of the swing-bolster centre-bearing maximum-traction type. Many original features have been introduced into the design of this bogie, and the clean lines, as well as the sturdy construction, will be noted. This 39-E swing-bolster maximum-traction truck is at present in use on the Preston Corporation Tramways, and the Gateshead and District Tramways also have cars mounted on similar bogies. The second illustration shows the Gateshead car mounted on the Brill 39-E trucks. These cars were built at the Gateshead depot for the special purpose of dealing with heavy additional traffic. The length of car over buffers is 43 ft. 3 in., and has a seating capacity for 46 passengers. The cars are of the pay-as-you-enter type.

The 39-E trucks are designed to be placed with the pony wheels toward the end of the car, although in some cases they have been arranged for the reverse position.

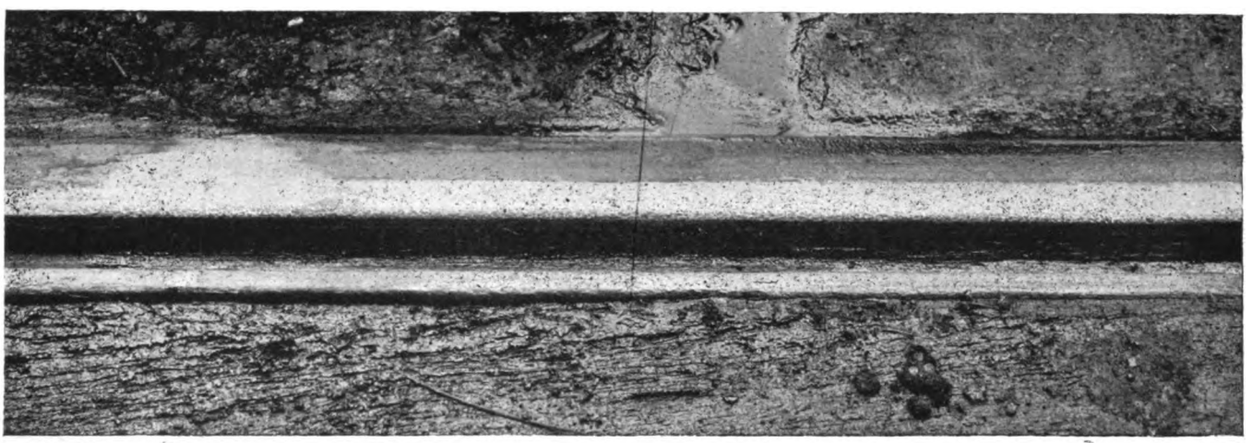

**Fig. 6.—Effect of Corrosive Liquid on a Sandberg Steel Rail.**
(The corrosion is uniform and mild.)

With the pony wheels toward the end of the car the bolster centres can be placed farther apart without interfering with the platform supports, or increasing the height of the car. Also a centre-pull lever may be used for the brake system, which enables an equal division of pressure to be maintained on the shoes of both sides of the truck on curves as well as on tangents. Another advantage of having the pony wheels toward the end of the car is that by placing the V-plate of the compression device on the end crossing of the truck frame, the weight on the pony wheels is not only

Digitized by Google

increased on curves, but the wheel on the outer rail receives more weight than the wheel on the inside.

The bolster in these trucks is supported on semi-elliptic springs placed longitudinally, the ends of which rest in links suspended from the side frames. The links cushion the side swing of the bolster on curves, to the benefit of both car body and trucks.

As usually built, these trucks have a 4 ft. 6 in. wheel base, 20 and 21 in. pony wheels, and from 30 to 33 in. drivers. With 30 in. wheels, the platform step treads may be $14\frac{3}{8}$ in. from the rail, from treads to platforms 12 in., from platforms to car floor $8\frac{1}{4}$ in. The central or pivotal point of the truck being within a few inches of the centre of the driving axle, the swing of the large wheels is reduced to a very small amount, even on sharp curves. It also reduces the swing of the motor, so that large motors may be used without interfering with the car sills, enabling the car body to be brought low. There is, of course, an increased radiation on the pony wheels, but as they are of small diameter, they swing clear of the sills.

The eccentric disposition of the load, or the placing of it near the driving wheels, is one of the chief features of the single-motor truck. The load is carefully distributed upon the drivers, giving ample tractive force for grade climbing and rapid acceleration. Only so much weight is left upon the pony wheels as is necessary for guidance on tangents. By means of a V-plate, a spring post near the axle of the pony wheels is depressed when the truck takes a curve, thereby increasing the load on these wheels for the time, precluding any possibility of derailment. When the truck is placed with the pony wheels turned towards the centre of the car, the V-plate is attached to the car body and the spring post is mounted on the truck; this is reversed when the pony wheels are towards the platform. The apparatus is adjustable to suit conditions by simply turning a nut bearing against the compression spring. Usually it does not require attention, since a suitable distribution of the weights is made and the device adjusted before the trucks leave the works.

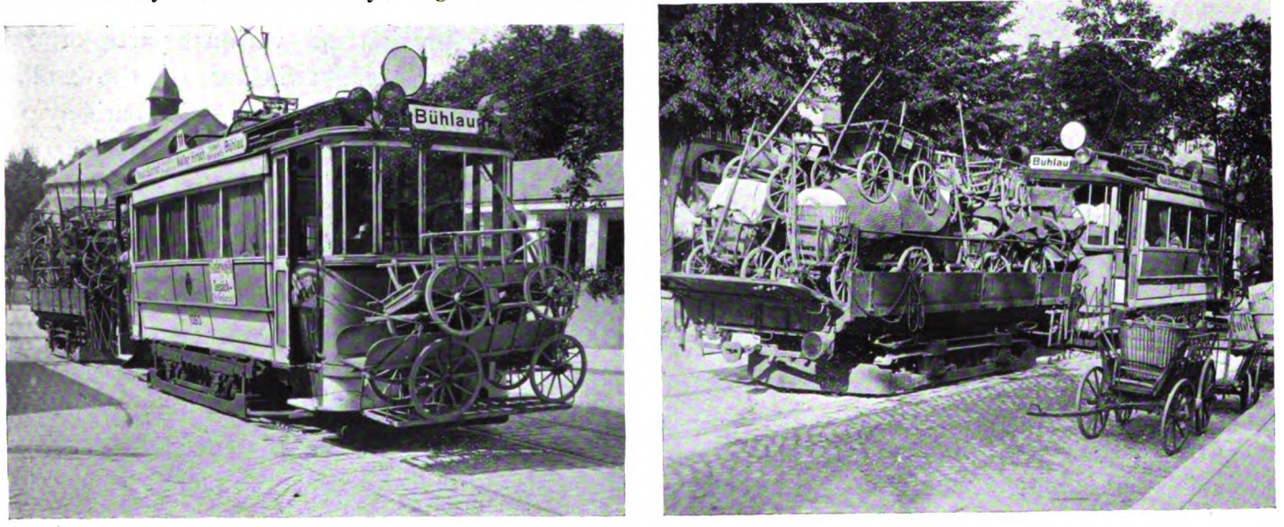
## GOODS TRAFFIC ON DRESDEN TRAMWAYS.

The exceptional tramway service which the Municipality of Dresden has created to meet the peculiar requirements of the inhabitants of a locality situated at some distance from the town, is of special interest at the present time. The problem which confronts so many urban authorities is that whilst there is crying need for the extension of routes into extra-urban districts, the population is nevertheless too sparse to permit of such service being remunerative. The example of Dresden in supplementing passenger returns by special goods traffic has an important bearing on this point.

Most of the laundry work of Dresden is done outside the town. In the region through which the Waldschlösschen-Weissig line passes quite a population, women mostly of course, are engaged in this occupation. The road into Dresden is extremely uneven, some of the gradients being very steep, and the transport of the washing from and into the town has always been a great hardship to the women, and in many cases rendered the task impossible. The washing was conveyed in the low carts of primitive form common everywhere in Germany; dogs are harnessed to these, and once arrived in Dresden the task of delivery is comparatively easy. The only element of difficulty in the situation is the intervening road, and the utilisation of the tramway service was the only means by which this could be overcome.



Transport of Hand Carts by Tramway—Dresden Municipal Tramway.

To provide for this service, special trailers have been constructed for conveying the carts. They are provided with special flaps, which greatly facilitate loading and unloading. These carts are taken on the wagon only at Waldschlösschen, but discharged at any point desired on the journey. The arrangements are so convenient, and the construction of the goods trailers so well adapted for the purpose, that any of the washing carts can be put off in less than one minute, and no interruption of the ordinary six-minute service is caused.

The persons who deliver the washing, together with the dogs and a certain number of baskets, are carried in the motor car. There is no disorder whatever; women and dogs get off the cars at any point, and their cart with its load is placed on the road for them at once. There is one limitation, however, to which, when the traffic is heavy, no exception can be made. The carts are unloaded from the trailer exactly in the reverse order to that in which they have been taken on. Consequently, the washing folk have to range their carts according to their separate destinations; if they fail in this, they may be taken further than they wish to go, but naturally, in their own interest, they do not often fall into an error of this kind. They are, of course, assisted by the goods conductor, who will, as a rule, make any slight rearrangement necessary in the course of loading up.

The municipality, while responsible for the safe delivery of goods to a reasonable extent, as specified in the by-laws, will not compensate for damage to goods due to bad packing, or any other non-compliance with the regulations, and, similarly, the owner of goods will be liable to pay for the repairing of any damage which they may do. Anyone conveying explosives or anything else which is dangerous or a public nuisance may, in addition, be heavily fined.

It will be readily understood that where arrangements are so elastic as to cope with such difficult transport as this, the ordinary goods transport will also be considerable. For this also, that is to say the transport of parcels on the ordinary cars, admirable arrangements have been made. The driver's platform is reserved for passengers with packets, who must remain with these, as the management accepts no responsibility in this case. The charges are very small: they are based on the amount of floor surface taken up by the packages, and are equal to the fare or fares of the person or persons who could otherwise occupy this space. It will be seen that by piling goods on each other, they will be most advantageously transported, as their cost will in this way be exceedingly small for the owner. It only remains to add that the service has not only been of great value to a striving and needy class, but also a source of much profit to the municipality.

**An Opening for Electrification.**—At the quarterly meeting of the Wicklow County Council, the county surveyor reported having carried out the annual inspection of the Dublin and Blessington Steam Tramway. In giving the financial results for the past year he said the increased receipts obtained by giving a better service, when there was an opening for such, were altogether eaten up by the fuel bill, and when the cost at 3s. 9d. per tram-mile of the electrically-worked Lucan tramway was compared with 19s. 6d. per mile of the Blessington line, it was easy to understand why the counties had to contribute. There was nothing for it but to try to have some change made on the line, and it would be in the Council's favour if the line were worked by electricity. Mr. Walsh asked: Would the County Council, as the largest guarantors, enforce the sale of the line to any company willing to take it up? The Surveyor: I cannot tell you. It is wrapped up in the law. Mr. McCarroll said the matter was in the hands of a committee who were doing their best in the interests of the Council. The report was referred to this committee.

**The Noise of Tramways.**

During the 1912 Conference of the Municipal Tramways Association, Professor Carus-Wilson roused a certain amount of resentment by describing the tramcar as one of the noisest of public vehicles, and by suggesting that tramway engineers ought to give serious attention to the problem of reducing the volume of sound. The resentment of the members was only half serious, because they seemed to doubt whether the speaker himself was quite serious in drawing a comparison between the tramcar and the motor omnibus in favour of the latter as regards quietness of running. It is worth noting, however, that a similar comparison was made only a week or two ago in the *Times*. The petrol vehicle was formally claimed to be the most silent on the road, because it runs on rubber tyres, and is now provided with gears which operate without appreciable noise. While the tramcar was not condemned as the noisest vehicle—that distinction being given to the horsed van with its iron tyres and its chains and other loose gear—the wheel-on-rail system was definitely fixed as essentially more objectionable than the tyre-on-road system. Almost the only protest against this judgment was that made by a correspondent who referred to the multitudinous hootings of motor cars and to the nerve-racking jar which the changing of gear still produces. But we need not go into the question of relative noisiness in order to appreciate the contention that a tramway service often produces more noise than is pleasant to the residents, shopkeepers, and the public generally. If anything could be done to modify the noise materially, it would be a real gain to the popularity of tramways. We may put aside, for the moment, the factor of rail corrugation, since it is an exceptional trouble which every tramway manager is only too anxious to remove. Under more normal conditions the noise caused by a tramcar is due partly to the rolling (or skidding) of the wheels on the rails, and partly to the rotation of the motors and gears, the grinding of the wheels at curves, the knocking of the wheels at joints and crossings, the vibration of various parts of the equipment, and the swishing of the trolley on the wire. Most of these noises are aggravated by the tendency of the car body to act as a sounding board. No two systems are quite alike in the degree to which the various parts of the equipment contribute to the noise of running, but there must be few systems which are not susceptible to improvement in regard to nearly all the sources of sound vibration. The noise of the gears may not be capable of great reduction, but as it is a sustained note of low pitch it does not have the most serious effect on the nerves. Intermittent noises, such as the knocking at joints and the shrieking at curves (together with the general rattle which seems to accompany the movements of some cars at high speeds) are much more objectionable as well as more readily cured by attention to the condition of the track and the upkeep and design of the trucks. There are some systems which literally cry aloud for reconstruction. One can measure the debility of a tramway system by the noise it makes; and the same token shows that energy is being expended unnecessarily. Banging and grinding and rattling are sure signs of wasted power, and their existence to an abnormal extent on any tramway should force the management to reorganise the equipment. In any case there are plenty of reasons why tramway engineers should give close attention to a problem of whose existence they have perhaps not been fully aware. Hitherto there has been no persistent

Digitized by Google

and deliberate effort to secure the quietest possible running. If those responsible for the design of cars and the construction and upkeep of tracks united in this effort, there would be less likelihood of the free-running vehicle claiming popular favour on the ground of silent operation.

---

**Prepayment and Accident Prevention.**

A significant admission was made to an interviewer by the manager of the Bradford Tramways a few days after his return from the Municipal Tramways Conference. At Bradford the partial prepayment method, *i.e.*, the collection of the fares of top-deck passengers on the platform, came into operation on June 1, and Mr. Spencer stated that since that date the average number of passengers who have received injuries while alighting from cars has been 33 per month, as against 56 per month in 10 months prior to that time. Mr. Spencer added that the cases of passengers being without tickets or over-riding the stages have also very considerably decreased, and he cannot understand why a man should be content to wait his turn in a queue at a railway booking office and object in the case of a tramcar. Clearly in a few months' time we ought to be able to announce that Bradford has agreed to give a trial to cars properly fitted for prepayment. Now that the London County Council have put into force their powers to compel passengers to form queues, and now that the majority of ordinary passengers buy the cheap return tickets introduced through omnibus competition, the time is favourable for Mr. Fell to impart to the Highways Committee some of the interest which he takes in the pay-as-you-enter system. Hitherto the chief obstacle to a trial of it in London has been the Commissioner of Police, but Sir E. Henry may be interested to learn that the Chief Constable of Aberdeen considers the system an advance on the old one. Mr. Fell's objection, put forward in the course of the discussion on the subject at the Municipal Tramways Conference, that with the prepayment system London would have to return to the reversed staircases, which the police ordered to be altered a few years ago, loses its point when it is recalled that their order was made on account of the staircase obstructing the side view of the motorman. On the more commodious platform provided with the pay-as-you-enter designs, the staircase is not advanced to the point of obstruction. Moreover, the reversed staircase obviates all danger of a passenger falling through the railing on to the road. As to the remark that in London passengers might sustain injury in wandering about the upper deck in order to descend at the motorman's end, the same objection is applicable to the present system. Unless passengers leave their seats while a car is in motion they are now carried beyond the place where they desire to alight. Perhaps the greatest fear that animates tramway committees in regard to the prepayment plan is that it would not be workable in towns where the fares are varied and complicated. To these inquiries the Leicester chairman made the reply that his conductors carry twenty kinds of tickets, and that the ticket system there is a complicated one.

---

**State-Operated Tramways.**

Much can be said in favour of carrying on the work of local transportation by municipal enterprise, but it would be difficult to find sufficient grounds for tramways being owned and worked by the State. A municipality is amenable to local feeling, and knows, or ought to know, local needs, so that even the out-and-out advocate of private enterprise can see that there are some arguments in favour of municipal tramways. But what can be said in support of the principle of "the dead hand of the State" being laid on transportation systems which do not affect the country as a whole, but only certain parts of it, each part with it own local requirements? Many sound reasons can be brought forward against the nationalisation of railways, but still there are some in favour of the scheme where all the railways of a country can be worked as one big system. No such reasons exist in favour of State tramways. Even railway nationalisation has its troubles; one need go no further than the recently issued report of the South African Railways showing decreasing net revenue, rising expenditure, enormous wages to employees backed by requests for more, and inability to set aside enough money for depreciation and renewals. These and other reflections are suggested by the last report of the New South Wales Government Tramways. These lines are confined for the most part to

Digitized by Google

Sydney and its immediate environs, but no doubt the Government will start tramways as required in other parts of the State. In past years these tramways have paid their way after allowing for working expenses and interest on capital, though there appears to be no sinking fund. For the year ended June 30, 1912, there was a surplus, after meeting working expenses and interest, of £57,000. But for the year ended June last there was a loss of £32,000. While the revenue for the twelve months rose by £173,000, the expenses increased by no less than £240,000. The passengers increased by over 27½ millions and the mileage run by fully 2½ millions. The deficit is attributed to the same cause which produces difficulties wherever the State works railways—namely, the necessity for giving in to demands for higher wages from employees who are also electors. It seems that the tramway staff numbering 9,170 men (for a system measuring 208 miles) have received concessions and advances equal to £282,230 per annum. Part of this money may of course be wages paid to additional men required owing to shortening the hours of work. In any case the total increase in money is equal, on an average, to nearly 12s per week per man of these 9,170 men. This it is to have State tramways and the Labour party all powerful. Even apart from the financial disorganisation of the tramway undertaking, what is to happen to private enterprise and the individual employer if they have to pay wages commensurate with those paid by the State? Undoubtedly a very difficult problem is arising and indeed has arisen in many of the British dominions. Apparently we are to see State tramway experiments, more or less direct, in West Australia and New Zealand. Unless sane counsels prevail, the end of such systems of management can only be bankruptcy.

## THE LATE BARON ZIFFER.

We record with deep regret the death, at the age of 81, of Herr Ingenieur Emanuel A. Ziffer, Edler von Teschenbruck, a title with many others he had earned through his extraordinary services as president for many years of the Austrian Union of Tramways and Light Railways and of many of the companies affiliated to it. He was a prolific writer on technical subjects, and was well known to all participants in the Tramway Congresses organised by the Permanent International Tramways Union for many years past. He was one of the original members of the Union and had served on its Council for many years, and the earnest and enthusiastic way in which he worked in the development and advancement of all light railway and tramway matters was remarkable. His untiring energy never flagged until his last illness, and only recently he was actively pursuing his professional work. He suffered but a short time, and died on October 27 last at his residence in Vienna. He was buried two days later in the central cemetery in the presence of many of his friends and admirers.

## A MUNICIPAL TRAMWAY IN SAN FRANCISCO.

Although the question of municipally-owned tramways has from time to time been agitated in the United States little or nothing has been done in that direction, so that a municipal tramway in that country is a departure that will be watched with keen interest. We give below some particulars regarding the inception of one such line, called the Geary Street Municipal Railway, San Francisco, based upon an article in the *Electric Railway Journal*, of New York. Readers acquainted with the history of tramways may recall that Geary Street, San Francisco, is a name prominenly associated with the commercial beginnings of cable tramways many years ago.

It appears that for a long time the municipal ownership of what are called public utilities has had strong advocates in San Francisco. The proposal to have a municipal tramway first came up in 1896 in connection with an effort of the Geary Street, Park, and Ocean Railway to secure a 50-year extension to its franchise in Geary Street, which was to expire in 1903. The company were refused a renewal, and the same thing happened again in 1898. In that year the city adopted a new charter, in which the intention of the city to acquire, own, and operate public utilities was expressly declared. In 1902 and 1903 unsuccessful attempts were made by the advocates of municipal ownership to get authority from the voters of the city for a bond issue to secure funds for the reconstruction for electric traction of the cable tramway. When the franchise of the company expired in 1903, the company continued to work the line and paid 5 per cent. of their gross earnings for the permission. In 1905 the Board of Supervisors declared their intention of rebuilding the road without recourse to a bond issue. All was ready for the construction work when the earthquake and fire of 1906 devasted the business section of San Francisco. All records, plans, and estimates were destroyed.

Some 18 months later the project was revived, but an appropriation of money from the city budget for the purpose was declared illegal. Another proposal in 1909 to issue bonds failed to get the necessary two-thirds vote of the electors, but in the end of that year proposals of the same kind were at length carried. A legal action to restrain the selling of the bonds failed, and about $2,000,000 worth have been issued. They bear interest at 4½ per cent., and mature yearly from 1915 to 1934.

Construction work began in the summer of 1911, and at present 7·6 miles of double track are in operation. Forty-three cars have been purchased, and a reinforced concrete car shed has been built. In August last an additional bond issue of $3,500,000 was voted for the construction of new lines and the reconstruction of existing ones. When the Geary Street line was taken over no allowance was made for old rails, etc., but the company were allowed to remove any property they desired.

The cost of construction and equipment (power is purchased from a company) was $1,680,255. The receipts for the period from December 28, 1912, to June 30 last were $134,924, and the expenses were $73,252, leaving a surplus of $61,672. After paying interest, but with no allowance for taxes, depreciation, or sinking fund, there remained $32,557. Moreover, the interest was not charged on the total cost, but on the cost of such parts of the road and equipment as were in use at a given time. The finances of the undertaking have been subjected to some criticism, but the mayor thinks it is a veritable gold mine. Time will show.

## CARS OF THE COLOMBO TRAMWAYS.

The accompanying photographs illustrate a convertible car of a type which is being adopted as a standard by the Colombo Electric Tramways and Lighting Company, Limited. The motors and equipments have been supplied by Messrs. Dick, Kerr, and Company,

Car with End and Side Entrances.

the motors being of the manufacturers' latest type, fitted with interpoles and oil ring lubrication. The car illustrated is mounted on an M. and G. "Warner" radial truck, with an 8 ft. wheel base. The body was built in the company's workshops at Colombo, and has a seating capacity for 38 passengers, including four seats for first-class passengers, for whom a

With Side Entrance Blinds Lowered.

separate compartment is provided. As will be seen from the illustrations, there are three centre openings on either side of the car and end exits, which permit of exceptionally rapid loading and unloading. The provision of a central aisle and cross benches enables inspectors and conductors conveniently to perform their duties.

**West Bromwich and Railless Traction.**—At the October meeting of the Town Council a memorial was received asking the Corporation to avail themselves of the powers conferred by the Corporation Act in respect of the provision of vehicular conveyances to and from the Old Church district. The Highway Committee reported that they were considering the question. The borough surveyor, Mr. A. D. Greatorex, has visited Leeds, Bradford, and other places where trackless trolley systems are in operation, and will present a formal report on the subject.

## THE AMERICAN ELECTRIC RAILWAY CONVENTION.

The annual convention of the American Electric Railway Association and of its allied bodies, which was held in Atlantic City from October 13 to 17, appears to have been very successful. The attendance of delegates was large, and the papers and reports presented were so numerous that the time for discussion was not always adequate.

At the opening meeting of the Electric Railway Association it was reported that it has now 401 member companies and 2,997 individual members, and that 450 individuals engaged in committee work during the past year. There is not a single city of any size in the United States which is not represented in the membership of the Association. This is a highly satisfactory state of things, especially in view of the increasing difficulties which in America are besetting the industry.

In the multitude of speeches, papers, and reports which were submitted to the various associations, perhaps the most interesting from a general point of view was the opening address to the Electric Railway Association by President Harries. In this he foresaw that unless there be well-nigh miraculous intervention, electric railway companies are in for a succession of more or less destructive experiences. These will result on the one hand from the broadening of city borders, and the consequent extension of lines, forcible multiplication of transfer points, compulsory wage increases, conscienceless taxation, arbitrary and unreasonable service requirements, and growing cost of construction and maintenance, and on the other hand, from the fixed or rather the diminishing fare. Every element of cost has advanced by leaps and bounds, while the fare has steadily decreased. Mr. Harries favoured a graded fare according to distance, something after the British method. The Association has a department called the bureau of fare research, from the work of which much is hoped. In dealing with other matters, the president insisted on the importance of publicity work being carried out through the executives of the various companies, and of the industry being in the future even more than in the past officially represented at Washington, so that the Association can keep in touch with the many legislative, executive, and judicial projects that concern common carriers. Before proceeding to refer to the valuable work during the year of the committees of the Association, the president made one reference which will strike a responsive chord in this country. He said that in some cities the public motor 'bus already presents a serious proposition which, if not considered promptly, may develop into a problem the country over. The unfairness of competition between the cheaply licensed and mobile vehicle and the expensively franchised and restricted railway has awakened comment. Remedial measures should be framed by an Association committee. These words of the president are equally applicable in this country.

A matter of some interest on this side was the fact revealed by several reports submitted, that progress is being made with the work of establishing standards in design and in construction work. Several additional standards were adopted during the Convention. There are three divisions in the proposals made by the Standards Committee of the Electric Railway Engineering Association, namely, standards, recommended practices, and miscellaneous approved methods and practices. A standard style of overhead construction has been adopted.

Another point on which British practice is being followed is a standard classification of accounts. The Accountants' Association are still working on this, and

Digitized by Google

the Inter-State Commerce Commission are to give their aid in the final settlement.

Among other subjects on which reports or papers were presented were working rules, signalling, the prevention of accidents, structures and buildings, power generation and distribution, welfare of employees, profit-sharing, electrolysis (evidently still a troublesome matter in America), and the development of the self-propelled car for lines where the traffic is light.

At least one representative of tramways from this side of the water attended the gathering, namely, Mr. James Dalrymple, general manager of Glasgow Corporation Tramways, who was then in America making a study of electric railway practice there. The American must have his joke, so Mr. Dalrymple is represented as having said to an "unofficial interviewer" that the famous Atlantic City ocean was fully equal, so far as its spectacular features were concerned, to that which bathed the shores of Great Britain!

Among those who attended the manufacturers' exhibition, which is always a feature of the Convention, was Mr. G. H. Anger, managing director of the Anger Manufacturing Company, of Preston, who in conjunction with the Ackley Companies showed his automatic brake adjuster, with which our readers are familiar. Mr. Anger was present during the Convention.

## CORRESPONDENCE.

### Municipal Tramway Conference.

To the Editor of the Tramway and Railway World.

Sir,—The Municipal Tramways Conference has come and gone, and the only thing that remains is the very excellent report of the proceedings furnished by the technical press.

To the ordinary delegate there did not appear to be any new line of thought introduced, either in the presidential address or the papers read, and the discussions seemed to be of the usual character, being carried on principally by chairmen and deputy-chairmen, certainly not of the larger undertakings. The only other persons who appeared to have any opportunity of taking part in the discussions were a few members of the Executive Council, who usually have something nice to say about their particular undertakings; one, especially, who seems to think that his own system is the centre of tramway creation. Under the circumstances, it is not to be wondered at that, generally speaking, tramway managers outside of the Executive Council assume a passive attitude at these conferences, and this is likely to continue until a change is made in the methods of electing the Executive Council. It would probably be efficacious if a rule was introduced under which it would be obligatory for members of the Council to retire at the expiration of three years' service, and not be eligible for re-election for a fixed period. Past-presidents could remain on the Council as *ex-officio* members. By the introduction of such a rule each member of the Association would have an opportunity of serving on the Council, thus creating a new and all-round interest in the work of the organisation. It is to be hoped that the Council will consider this suggestion.

Coming back to the proceedings at the Conference, one finds nothing new in the president's address; but although President Fearnley touched no absolutely new ground, yet we could quite appreciate his prudent remarks, which will, no doubt, be helpful to the younger and less experienced managers.

With regard to Mr. Alderman Flint's paper on the pay-as-you-enter system, surely this title is a misnomer, as it could hardly be described as a paper in the accepted sense of the term. Would it not be more correct to call it a description of the methods adopted by the Leicester Corporation in the management of its traffic department?—methods which I venture to think will not be followed by any tramway authorities who run their undertakings on strictly business lines. Mr. Alderman Flint was good enough to give us a history of the ancient and modern systems of fare collecting on his undertaking, and furnish us with a list of the most complicated ticket system I have ever met with during a very extensive experience, including overlapping, discount, transfer, return, and return transfer tickets, etc., etc. The paper is embellished with copies of these tickets, and, in addition, the photograph of a gentleman who is the recipient of a free pass, and whose name appears on the pass, which entitles him to "ride free on all sections." This pass is actually signed by the chairman of the committee, apparently "none genuine without!" A copy of another free pass is shown, and the name of the recipient given. This pass is also signed by the chairman, but unfortunately, no photograph is given. Surely there is a little incongruity about this matter, and persons of a humorous tendency might even describe it as Gilbertian. Of course, it must be admitted, that the gentleman who received a free pass without his photograph upon it has a real grievance, and we most sincerely hope that the chairman will forthwith remedy this undoubted grievance by having the photograph added and initialled by himself.

Regarding Alderman Flint's advocacy of the pay-as-you-enter system, I do not think that experienced tramway managers will treat his remarks on this question seriously, as it is perfectly obvious to those of us who have sufficient experience in the collection of fares that it would be quite impossible to collect all fares on the platforms of cars on any of the large systems before passengers entered the car during the crush hours without delaying the traffic and causing an intolerable nuisance to the passengers, apart from other practical difficulties.

It is, of course, the desire of every tramway manager to have the fares collected as soon as possible after passengers board the car, and the great majority can be collected on the platforms during normal traffic without delay.

Yours, etc.,

*October 21, 1913.* A Member.

## PROGRESS OF THE PREPAYMENT CAR.

The Gateshead and District Tramways Company have recently placed a new pay-as-you-enter car on the Low Fell route. The car is illustrated on page 414.

Aberdeen Tramways Committee have considered a report prepared by Mr. Pilcher, the general manager of the Corporation Tramways, on the working of the P-A-Y-E cars in the city during the present year, with a view to adopting the system for six new cars which are shortly to be purchased. The committee decided to take no action until after they have inspected a wider staircase, which is being constructed at the department's workshops.

Ten new top-covered cars ordered by the Leicester Tramways Committee are to be constructed so as to be capable of being used as P-A-Y-E cars in the event of the Corporation deciding to add to the number of such cars now in use.

### Leicester Employees Praise the System.

At a well-attended meeting of the Leicester branch of the Amalgamated Association of Tramway and Vehicle Workers, the advantages of the P-A-Y-E system over that of the old type of car were discussed, and the following resolution was adopted: "That we deeply regret the attitude taken by the Town Council, and a small section of the public, with regard to the proposal of Alderman Flint to extend the P-A-Y-E system in Leicester. Those of us who have the experience of working both systems, claim that we should know something of the advantages of the P-A-Y-E over the old cars, and we are unanimous in our approval of the P-A-Y-E system. We are also unanimously of the opinion, that, viewed from every standpoint, the system is far superior to the old one."

## TRAMWAYS AND RAILLESS TRACTION AT ABERDARE.

FIRST INSTALLATION OF THE COMBINED SYSTEMS.

The system of tramways and railless trolley routes belonging to Aberdare Urban District Council, the formal inauguration of which for public service took place on October 9, following the Board of Trade inspection, forms the first systematically combined scheme of the sort conceived, constructed, and opened as one undertaking. Messrs. Stephen Sellon and Partners were the consulting engineers for the undertaking, which was authorised by Act of Parliament in 1911, and the route lengths comprise $2\frac{3}{4}$ miles of tramways and $3\frac{1}{2}$ miles of trackless trolley line. The tramway track is laid with girder rails of Sandberg specification, weighing 96 lb. to the yard. The line includes some gradients, the maximum reaching 1 in 13. The tramways are constructed as a single line with passing places, and the overhead equipment is mainly on the span-wire method. The four railless routes, which diverge from the tramway at four different points, are equipped on the Cedes-Stoll system with bracket arm construction. The overhead work was erected by Messrs. Clough, Smith, and Company. Single-deck tramcars, each with seating accommodation for 28 passengers, are used, while the railless cars each seat 27 passengers. The depot is situated at Gladlys, in close proximity to the Council's generating station, wherein additional plant has been installed for the purpose of meeting the traction load. The power-station has two additional units, the engines having been supplied by Belliss and Morcom and the dynamos by the Lancashire Dynamo Company. The total capacity available for traction is 400 KW.

The Glamorganshire valley, in which the undertaking is situated, is a hive of industry, coal mines and iron and other works being dotted along it. The centre of the locality is Aberdare itself, with a population of over 50,000, but industries straggle out to the south-east and north-west. Additional means of communication of a local kind was, therefore, felt desirable, and this led to the combined scheme of the District Council, which has now reached fruition.

The combination of tramway and trackless trolley is

———Tramways. – – – – – –Railless Lines.

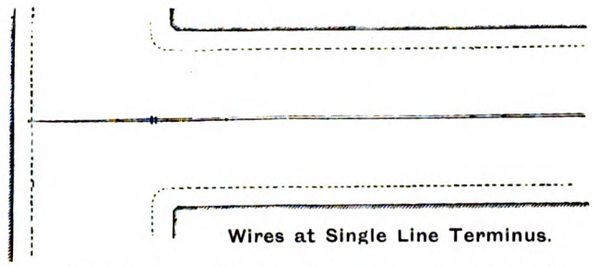
**Tramways and Railless Lines at Aberdare.**

thoroughly well suited to the locality. There is one through tramway route, single track with passing places, from Aberaman in the south-east, through Aberdare, to beyond Trecynon in the north-west. This trunk tramway line is fed by and acts as a distributor to four trackless trolley routes on the Cedes-Stoll system which run through outlying districts. From the southern end of the tramway one of these routes extends nearly a mile further south-east to

"Cedes" Railless Trolley Installation at Aberdare.

Digitized by Google

a village called Capeoch. From the same point a second railless route reaches south-westwards up a side valley for a mile and a quarter to the village of Cwmaman. In the centre of Aberdare the tramway sends off another railless spur north-eastwards for nearly a mile to Abernant, while finally the tramway



Wires at Single Line Terminus.

is continued from its north-western terminus by a trackless route for half a mile to Cwmdare. The self-contained combined system was constructed at small cost, and is calculated to serve the population in a way which no other could do.

The railless routes entail severe services, as the maximum gradient is 1 in 9. The cars, which weigh 5 tons loaded, and provide seating capacity for 27 passengers, mount this gradient easily at a speed of

Railless Car Passing Under Railway Bridge.

Running with Trolley "Close-Hauled."

8½ miles an hour. On the level the maximum speed of the cars, fully loaded, is 16 miles an hour. The chassis of the cars and the equipment is identical with that of the cars at Keighley, which were described and illustrated in our issue of October 16. The design of the car body is, however, somewhat different, as will be seen from the accompanying views. The equipment at the termini is of the simplest character. As indicated in the accompanying sketch, the wire comes to a dead end, no reversing of the trolley being necessary.

The installation is under the charge of Mr. A. J. Abraham as general manager and electrical engineer, the traffic manager being Mr. Henry King. The chairman of the Tramways Committee is Mr. E. M. Hann, and the vice-chairman Mr. T. W. Williams.

The inauguration was highly successful, and the District Council, Messrs. Stephen Sellon and Partners, and the Cedes Electric Traction Company, as well as the local public, are alike to be congratulated on the completion of a really useful and efficient undertaking.

Members of the Council, together with representatives of Messrs. Stephen Sellon and Partners and of the Cedes Electric Traction Company, attended the opening run made by the cars. Later in the day the Council and officials were entertained at dinner by the consulting engineers. The proceedings were presided over by Mr. T. W. Williams, chairman of the Council, supported by Mr. T. Ingliss Rudman, resident engineer, Mr. Beverley Griffin and Mr. T. Williams, representing Messrs. W. Griffiths and Company, and Mr. J. Parkinson, representing Messrs. Clough, Smith, and Company. Mr. Beverley Griffin, in proposing prosperity to the town and trade of Aberdare, said that the events of the day showed that Aberdare was a progressive town, and he hoped that it would progress a little further, so that the scheme might be extended to Mountain Ash, four miles away. The Chairman, in reply, said he was of opinion that they depended too exclusively on the coal trade, but by providing electric power they would encourage other trades and manufactures, and would enable small men to compete with larger ones. Councillor L. N. Williams, in submitting "Success to the Aberdare Tramways," said he expected that before long the tramway profits would reduce the rates of the district. Councillor A. P. Jones, who responded, referred to difficulties which had been experienced in inaugurating what was for them a great public convenience. From appearances that day he was assured of a great success for the undertaking. Councillor W. Thomas submitted the health of the contractors, and said that all appreciated the great work which had been carried out. The Council were perfectly satisfied with what had been done. Mr. Stephen Sellon, who proposed "Our Guests," said that Aber-

"Cedes" Railless Car at Aberdare.

dare, apparently dead, had been wakened up to practical existence by electric tramways. He was especially pleased to see Aberdare placed above other districts, which would proceed to copy Aberdare.

## EXTENSION OF NEW YORK RAILWAY SYSTEM.

The New York Public Service Commission have issued a well-illustrated book giving a comprehensive account of the great developments which are being made of the underground and elevated electric railways in and around New York City. The new project is known as the dual system of rapid transit, and the following is a summary showing the single track mileage of existing lines and of those to be constructed. (The underground railways are described as subways.)

| For Operation by the Interborough Rapid Transit Company. | Track Miles. |
|---|---|
| Existing subway | 73·00 |
| Existing elevated lines | 118·00 |
| Subway and elevated lines for construction jointly by city and company | 146·80 |
| Elevated railroad extensions to be constructed by company | 10·40 |
| Third tracks on elevated roads to be constructed by company | 10·50 |
| Total | 358·70 |

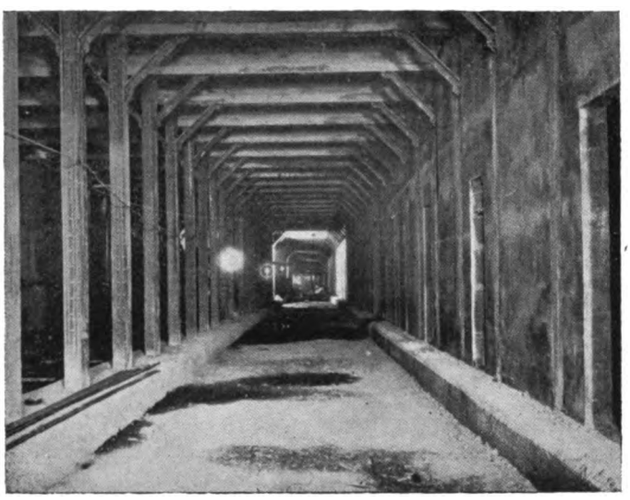
| For Operation by the New York Municipal Railway Corporation. | Track Miles. |
|---|---|
| Existing elevated lines | 105·00 |
| Subway and elevated lines for construction jointly by city and company | 110·41 |
| Elevated extensions for construction by company | 35·29 |
| Third-tracking and reconstruction by company | 9·30 |
| Total | 260·00 |
| Grand total | 618·70 |

The extended undertaking, it is claimed, will make the greatest city railway system in the world. The existing lines measure 296 miles of single track, and this, as shown by the above summary, will be raised to over 618 miles. The new lines will be combined with the existing ones, and will be worked in two divisions, one by the Interborough Rapid Transit Company, which operates the existing subway and the elevated railroad in Manhattan and the Bronx, and the other by the New York Municipal Railway Corporation, formed for the purpose by the Brooklyn Rapid Transit Company, which controls the existing elevated railroads in Brooklyn. The construction and equipment of the new system will cost about 337 million dollars (£67,400,000), and it will be borne jointly by the city and the two transit corporations.

On March 19 last, the City of New York, by the Public Service Commission, entered into separate contracts with the Interborough Rapid Transit Company and the New York Municipal Railway Corporation for the construction, equipment and operation of the dual system. While the existing mileage will be about doubled, the present facilities will be more than trebled, as the third-track and extensions of existing elevated railways will materially enlarge their capacity. At present the rapid transit lines are carrying about 800 million passengers per annum. The dual system, if used to its full capacity, will be able to carry more than 3,000 millions in the same period of time.

Out of the total cost the City of New York will supply about 171 million dollars, all of which will be devoted to construction work on lines to be owned by the city. Towards the cost of such lines the Interborough Company will contribute 58 million dollars and the Municipal Railway Corporation about 14 million dollars. The cost of additional construction on the elevated railroads, as well as that of the new equipment for both subway and elevated lines, will be borne by the companies, although the equipment of the city-owned lines will be the property of the city. The total contributions of the companies will be about 105 million dollars for the Interborough Company and 61 million dollars for the Municipal Railway Corporation. In addition to the above the city has already invested 55 million dollars for the construction of the existing subway, and the Interborough Company has expended 48 million dollars in equipment for the same lines. The total city investment will accordingly be 226 million dollars.

Owing to the situation of New York and the peculiar conformation of its five boroughs, its rapid transit requirements are exceedingly difficult to satisfy. Travel on city transportation lines is all towards the southern half of Manhattan Island in the morning and all away from it in the evening. The book proceeds to give details as to the existing railways and to the specific extensions which are proposed. One important change is that the Brooklyn Company will be allowed to enter



Subway In Progress Under Roadway.

Manhattan Island, where it will have a system of subways by which it can distribute its passengers throughout the southern part of the island. Thus the present congestion at the Manhattan terminus of the Brooklyn and Williamsburg bridges will be ended, and the passengers from Brooklyn will be able to reach their destinations in Lower Manhattan without change of cars or the payment of additional fares.

The contracts provide for a single fare of 5 cents on each system, with free transfers at intersecting points for a continuous ride in the same general direction. It will be possible for passengers to travel 26 miles for one fare and without change of cars. The contracts contemplate that the whole system will be in operation in the year 1917, but it is expected that parts

Digitized by Google

of the system will be put into operation from time to time as each part is completed, so that long before the time set for complete operation the community will realise in part the benefits of the new lines. Parts of the new system are already nearly completed, including the Steinway tunnel under the East River to Long Island City. The addition of a third track to the existing elevated railroads will enable the companies to inaugurate through express services on all lines where it is now possible to give only local services. In the borough of Manhattan the additional subway facilities will be about 5 times those provided by the existing subway. In explaining the various advantages which will be derived by the public, the Commissioners mention that there will be three additional tunnels under the East River between Brooklyn and Manhattan. The facilities in the Bronx will be more than quadrupled.

The new subways will show great improvements over the existing subway in many details. Instead of all four tracks being placed in one tunnel, there will be two separate tunnels with two tracks in each. Where there are only two tracks they will be separated by a partition wall. Strict provisions for minimising inconvenience to property owners during construction are inserted in the contracts.

The contracts for working the lines made with the two companies will run for 49 years from January 1, 1917; this to apply to the old lines as well as the new. The leases for the extensions of the elevated lines will run for 85 years. Provision has been made for equal sharing of profits with the city, after deductions of a large number of specified items have been made from gross receipts. Ample provisions are made for securing to the city the necessary control over expenditures by either company in the construction, equipment, maintenance, and operation of the lines. In the dual system of rapid transit the Public Service Commission believe that they have solved the present rapid transit problem of New York.

## VEHICULAR TRAFFIC AND TRACK MAINTENANCE.

Mr. William Baxter, 142, Newhaven Road, Leith, writes to us at considerable length on the above subject, the occasion being a recent article in these pages. One of his objects is to show the success which has attended the use of his chilled iron protectors in preventing the wear of the paving setts next the rails of tramways. It should be noted that the protectors consist of iron plates on edge between the setts.

Mr. Baxter writes, in brief, as follows:

There are many systems where heavier foundations have been adopted, but attrition and crushing are more or less common, hence it would appear that heavy foundations alone are not a lasting solution to the matter.

Attrition alongside of rail has been a source of endless trouble since the introduction of rails in public thoroughfares. Fully 40 years ago chilled blocks were introduced and largely used on many important systems with more or less satisfactory results according to the class of workmanship and material employed, and they undoubtedly for many years defied attrition, but they had several very material drawbacks. They cost from £1,500 to over £2,000 per mile of single track. The vehicular traffic hammered them and the setts down below the level of the rail tread, leaving matters, with the exception of attrition, much in the same condition as we find exists to-day.

As an illustration of how attrition alongside of rail can be avoided and the life of the rail tread prolonged, Fig. 1 shows track in which chilled protectors have been in for one year. This track, because of excessive vehicular traffic, required margins repaired six months after being first put down. Fig. 2 shows the same part

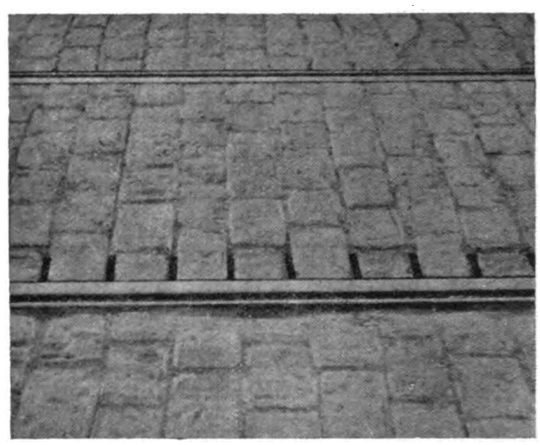


Fig. 1.

of track taken seven years after the first repair without further cost or repair and still in good order.

Fig. 3 shows track with wood margin and protectors

Fig. 2.

and granite setts in continuation without protectors. The part marked A is the wood margin with chilled protectors over five years down. B shows granite setts renewed twice in five years (without protectors), while C are granite setts with protectors down seven years (centre of track since repaired).

Fig. 3.

The above proves that wood paving when the work is well done lasts longer and gives a better surface than any granite, and that with the heaviest of motor and all kinds of vehicular traffic common to a large shipping port. The maintenance of track has always been under £50 per mile. It is claimed that without exception where the workmanship and materials are what one would reasonably expect, all that anyone could desire has been the result from a maintenance and financial point of view.

# POINTS IN REGARD TO POWER GENERATION.

## STEAM TURBINES *v.* GAS ENGINES.

At the meeting in Atlantic City during October of the American Electric Railway Engineering Association, an interesting report was presented by the Association's Committee on Power Generation.

On this subject the committee stated that on account of the low first cost and high economy of steam turbine generating stations the possible economy of gas engines and gas producers is so small that there is little general interest in this subject for the member companies. From information in the hands of the committee it is the belief that with gas engine plants costing $90 per KW. or more, as compared with steam turbine plants at $50 per KW., the saving in the higher economy of the gas engine would not be sufficient to offset the additional fixed charges, except in cases where the cost of coal was from $6 to $8 per ton. The report was accompanied by appendices, from which the following is taken.

### Peak Loads.

In the reports of this committee for the years 1910, 1911, and 1912, the important bearing of fixed charges to the total cost of plant output for various load factors was clearly brought out, as operating costs do not materially change for the various load factors. Except in a few cases where there is an excessive and unnecessary amount of standby apparatus installed, the only portion of the power-station in which a reduction in first cost and the related fixed charges can be made is in the boiler room. Here the reduction in cost must be made by securing an increase in the steaming capacity of the boiler plant.

Curves showing the combined efficiency of boiler and furnace when operating at various rates of evaporation per square foot of heating surface are shown in the accompanying illustration. All of these curves are continued to the present known maximum rate of operation.

Equivalent Evaporation (from and at 212° F.) per Sq. Ft. Heating Surface

**Relation of Steam Boiler Efficiency to Capacity.**

The curve showing the performance of the marine boiler represents work recently done under the direction of the Navy Department at the League Island Navy Yard, and, so far as known, represents the highest performance, both as to rate of evaporation and efficiency, yet obtained with this type of boiler. The performances of the locomotive and marine boilers are included to show the great possibilities for improvement in power plant operation, both in the direction of securing greater output from the installed boiler plant and better economy in its operation.

By reference to the curve, it will be noticed that the combined boiler and furnace efficiency at the usual rating for stationary boilers, 3·45 lb. per sq. ft. of heating surface per hour, is 80 per cent; if the boiler and furnace are worked at double rating the efficiency is 74 per cent. This performance, of course, represents conditions obtaining at a constant rate of working, and in the every-day operation of power-stations the combined efficiency rarely exceeds 70 per cent., which is due to the losses that occur during the period of light loads when the boilers are banked or held in reserve. By operating at higher rates during peak-load periods the number of boilers that must be banked at the time of light loads will be less, and consequently the losses that occur at such times will be reduced.

To show that the total cost of plant output is not increased, but on the contrary is decreased, with the higher rates of the working of the boiler plant, it may be said that the boiler room portion of the ordinary power plant costs about $30 per kilowatt when boilers are installed on the basis of operation at rated capacity. The cost can be reduced to about half this amount if the boilers are installed to operate at double rating during the peak-load periods, thus reducing the first cost of the plant by, say, $12 per kilowatt. The saving in fixed charges on this amount, at 12 per cent. per annum, would therefore amount to $1·44 per year on each kilowatt of installed capacity.

Estimating the yearly load factor at 27·5 per cent., which corresponds to an annual output of about 2,500 kilowatt-hours per week per kilowatt of installed capacity, the saving in fixed charges becomes 0·58 mill per kilowatt-hour. The coal consumption per kilowatt-hour of the plant will be increased in an inverse proportion to the boiler efficiency at the two rates of working, and there will be required, if the plant is worked at double rating during peak loads, 80/74 of the coal at normal rating. Such a plant would operate at 2 lb. of coal per kilowatt-hour under normal operation, requiring therefore 5,000 lb. of coal per year per kilowatt of installed capacity, which at $2·50 per net ton amounts to $6·25 per year. The annual cost for fuel at the higher rate of operation would therefore be 80/74 of $6·25, an increase of 50 cents per year for fuel. The net gain at the higher rate of working would therefore be nearly $1 per year per kilowatt of plant capacity.

### Suggested Arrangement of Automatic Relays and Apparatus to Protect Power Plants from Shutdown.

The success of any method of protecting a power system from shutdown is dependent upon the selective elimination of the faulty section and the maintenance of service in the remainder of the system with the least possible disturbance in voltage and frequency. The problem of cutting out an overloaded section under normal conditions of load and power factor is simple. The real test of a protective system is its ability to isolate a damaged section when a short-circuit or other trouble occurs with attendant circumstances of heavy power surges, low power factor, and reduced voltage.

To limit the heavy rushes of current which occur at times of short-circuit and to prevent shutdowns, a form of self-inductant reactance should be employed in conjunction with a suitable form of automatic relay. This reactance, unless inherent in the apparatus, would preferably take the form of an open coil without iron in the magnetic circuit and have a cross-section designed to secure the maximum self-induction, such as can be easily secured and installed at comparatively low cost; these coils to be placed directly in series in those parts of the system in which it is desired to limit the short-circuit current.

Where modern turbo-generators are installed, with at least 6 per cent. internal resistance, additional internal reactance may not be required. In most of the earlier machines, both turbines and transformers, the internal reactance was made as low as possible for the purpose of improving the regulation, but with the result that the short-circuit current was in some cases as high as 40 or 50 times full-load current. This, of course, is the maximum instantaneous current at the moment of short-circuit and dies down, decreasing quickly as the armature reaction builds up, counteracting the field flux and reducing the generator voltage. Reactance in the generator leads, besides protecting the generator from external short-circuits, has the additional advantage in case of trouble in the generator itself that it interposes an impedance between the bus and the fault, thereby reducing the shock on the system.

In the case of short-circuits occurring in the feeders or transmission circuits beyond the generator buses, a reactance located in the feeder itself is the most economical point of installation from the standpoint of minimum voltage drop under normal operating conditions, for the generator reactances are all in parallel between the source of electromotive force and a short-circuit on any feeder, while a feeder reactance is in series between the generator and a short-circuit on the feeder. Another advantage of having part of the reactance in the feeder circuit is that the busbar voltage is subjected to less disturbance when a short-circuit does occur owing to the interposition of the reactance between the bus and the short-circuit, and the stability of the system is hereby increased. An additional advantage results when a feeder is used as a tie line to other generating stations, or when it feeds synchronous apparatus, as a reactance in this line limits the amount of reverse power fed back from the other stations when a short-circuit occurs on one station feeder.

In stations of large capacity having sectionalised busbars and tie lines to other stations, a reactance between the bus sections or in the tie between stations or groups of machines permits a much greater total generating capacity to be operated in parallel with the same factor of safety in switching equipment and limits the area of the system over which any disturbances extend.

To overcome the objection of poor regulation and power factor caused by reactance there is sometimes installed an additional short-circuiting switch so connected as to shunt the reactance, and provided with an automatic instantaneous device to open the switch and cut in the reactance in case of short-circuit. The objection to this, however, is that the reactance is out of the circuit when trouble occurs and therefore does not necessarily reduce the shock to the system.

Where the generators are Y-connected on large underground systems, a further protection from shutdowns due to surges may be secured by grounding the neutral. This limits, even when solidly grounded, the normal voltage between any conductor and ground to approximately 58 per cent. of that between conductors—thus protecting the insulation

Digitized by Google

of apparatus. A resistance inserted in the ground connection limits the flow of current and shock to the system, and, for the underground systems, grounding the neutral through resistance is in general advisable, but, to take the other extreme, grounding the neutral on long-distance overhead systems is, in general, not advisable—the primary difference in the two extremes being the fact that one is an underground cable on which a fault to ground generally rapidly develops into a short, whereas the other is an overhead circuit of three separate wires and faults to ground can often be located and remedied without interruption of service; also on underground cable systems there are generally more spare cables.

RELAYS.

To isolate the affected portion of the system and protect the station from shutdown, reverse current, or reverse energy, relays operated from transformers in the generator leads, for the automatic operation of generator oil switches, should be installed. These relays should have the following operating characteristics: (*a*) Should permit of limited reversal without relay tripping in order to allow leeway for motoring when the generator is first put on bus before picking up load. (*b*) Operation at predetermined reverse load setting should be instantaneous. (*c*) Must not operate on overloads. (*d*) Must operate on reversal even with low voltage and low power factor. (*e*) Must not operate on over-voltage. In general, overload relays should not be installed to operate generator switches, and where they are installed they should be equipped with a definite time-limit feature, arranged so as not to operate under any condition of short-circuit, except at a given time setting.

In order to cut off from the bus a generator having an internal short-circuit, an adaption of the Merz-Price system of balance current has been proposed consisting of two transformers on each leg of the generator winding, one of the two being outside of the generator and the other being inside the star connection. Normally these two transformers are in opposition, and no current flows through a relay placed in the curcuit, but in case of internal short-circuit there is more current flowing in one transformer than in the other, and the relay will operate, cutting the generator off from the bus and opening the field circuit.

At the power-house end of feeders, relays of the overload type, with adjustment for the time limit, should be used. When feeders are operated in parallel at the sub-station end relays of the reverse energy type should be installed at the sub-station. On systems having sub-stations fed directly (sub-stations not in tandem or on ring system) and where the service is not such as to demand that the power supply be maintained at all hazards, inverse time element relays should certainly be employed at the generating station rather than the use of definite time relays. In cases of larger and more important but relatively short tie lines between generating stations, reverse current or energy relays should be installed in each station, interconnected so as to operate immediately upon reversal of energy or current at one end of the line. In general, for transmission and long tie lines, inverse time element relays should preferably be furnished of such characteristics that under all conditions of overload or short-circuit the successive relays maintain their selective sequence.

Some remarkable developments have been made within the last few years in the distant control of valves either by electricity, air, or steam. The perfecting of these different systems of control after an initial attempt has been exceedingly rapid, and the electrically-operated system has perhaps been the more pronounced in its advancement and adoption. Several interesting installations have been successfully completed with special reference to the operation of valves between boilers and headers and sections of the header, thus permitting any break in the pipe to be isolated by closing the necessary switches, which may be placed at any remote point for convenient operation. In one installation, a plant of 15 boilers, the cut-off valves from the boilers to the main header are controlled from the engine room with the switches conveniently placed, numbered distinctly and in plain view. In case of the loss of a tube, some one formerly had to mount the boiler and endeavour to locate the valve, frequently among clouds of steam, and by the time the valve was located and the boiler cut out the steam would be down on account of other boilers discharging more or less into the boiler with the damaged tubes. Employees have been scalded through this method or want of method.

In another plant, operation of the turbines is carried on from the switchboard, and steam is admitted and controlled electrically on all units. The governors of all the turbines are also controlled electrically, while in another part of the plant air is used for remote control of valves for shop purposes.

**Extensions at York.**—Powers will be sought next session for an extension of the tramways through Walmgate to Hull Road, and to the centre of Acomb Village, together with railless trolley car installations to Heworth; from Nessgate along Huntington Road to Haxby Road; to the Leeman Road district via Bootham and Clifton, and into the Burton Road district. Alderman Meyer, chairman of the Tramways Committee, estimates the cost of the extensions, which will practically double the present mileage, at about £72,000.

## BALL BEARINGS AND THEIR APPLICATION.

(COMMUNICATED.)

Without the slightest doubt cycle manufacturers entirely owe their success to ball bearings, for without them the pedal bicycle would never have become a commercial success. No one would think of buying a cycle now unless it were fitted throughout with ball bearings, and it would be an undoubted advantage to the users of all classes of machinery, no matter how large or how small the machine may be, whether it be for rough heavy work or for light accurate work, if ball bearings were fitted throughout." It is now being realised that plain bearings are not only a continual source of expense and trouble, but also that the life of the bearings governs in a large measure the life of the machine.

Among the serious drawbacks to plain bearings are the necessary constant attention, oiling, rapid wearing, noise, risk of running hot, and finally renewing, where possible to do so. This means stoppage of machinery and additional expense. In a great many cases, plain bearings have been made in such huge proportions in comparison to their duty, that the frictional loss in power alone can be reduced from 90 to 95 per cent. by the application of ball bearings, and therefore the importance of the application of ball bearings to all classes of machinery is at present engaging the attention of the engineering world.

For a number of years, after the bicycle boom, engineers considered ball bearings unsuitable for anything except small parts of light machinery running at high speeds, and generally speaking the main idea in using them at all was to save the space taken up by bearings of the common type. Thus they were able to lighten their machines and also to preserve a much neater appearance. During these years, manufacturers of ball bearings were not idle. No expense was spared in experimenting with bearings for all purposes, particularly for heavy loads and high speeds. After years of scientific research and study, combined with years of practical tests under almost every conceivable condition, they are now able to offer a ball bearing for any duty and to work satisfactorily under almost any conditions.

The importance of correct housing can be easily understood, a very great percentage of failures being due to bad mounting. Almost every ball bearing manufacturer will prepare drawings showing the correct method of fitting and housing for any particular case, and those who are fitting ball bearings for the first time will do well to obtain such information.

It may be safely asserted that ball bearings can be successfully fitted to almost every class of machinery, and it must be borne in mind that wherever these bearings are fitted all their advantages are consequently embodied in that plant, machinery, or vehicle. The advantages of ball bearings over any others are very great. In the first place, they are almost frictionless, and therefore lubrication is reduced to a minimum. Under actual test a ball bearing will run much freer without lubrication than with, but a little lubrication is necessary to keep the balls and races from getting rusty, and provision should always be made wherever possible for the bearings to run in an oil bath, so that moisture cannot get to them.

Being almost frictionless, there is practically no wear taking place. This makes ball bearings ideal for all classes of machinery, especially gearing, such as motor car drives, gear boxes, electric motors for tramcars and light railways, etc. Ordinary bearings used in such positions sooner or later become a source of trouble in themselves, as the wear affects the shaft centres, and consequently causes the teeth of the wheels to break, and thus in turn ruin the whole gearing. Ball bearings also allow machines to be made lighter, and in many cases ensure reduction in cost of material. They never run hot, and allow such freedom to the machine that it acquires a high degree of sensitiveness. The horse-power saved is usually about 75 to 90 per cent. of the total amount of frictional loss absorbed by ordinary bearings.

It is most important that ball bearings should be protected against grit, dust, and moisture. Great care should be exercised when mounting to see that end thrust does not come on radial bearings unless a bearing is used which is designed for thrust as well as radial duty. Shafts mounted on ball bearings will run at a much higher speed. A saving of 90 per cent. on the lubrication bill may be effected by the use of ball bearings with heavy loads or high speeds. The lubrication, however, must be free from both acid and alkali.

The object of ball bearing manufacturers has been to design their bearings so that they are self-contained, that is, after leaving their works there shall be no need for adjustment. The Skefko S.K.F. ball thrust bearings are also manufactured on the self-aligning principle, as it is contended that it is impossible for the ordinary users to fit ball bearings with anything like the degree of accuracy possessed by the bearing itself, and, therefore, any inaccuracy in fitting must be allowed for in the bearing. The Skefko S.K.F. Ball Bearing Company, Limited, is the English works of the well-known S.K.F. Ball Bearing Company, of Gothenburg, Sweden. Full particulars of all their patent radial and thrust bearings, together with other useful information regarding design, fitting, and use of ball bearings, can be obtained gratis from them on application to their chief office at Luton.

## ELECTRIC CAR HEATERS.

Some new types of electric car heaters have recently been placed upon the British market by Messrs. Watlington and Company, of Milton Street, London, E.C. As will be gathered from the following particulars and illustrations, the new designs contain many improvements over the older types, chief amongst them being reduction of weight, improved ventilation, and perfect insulation. From a variety

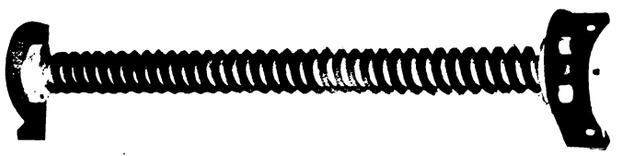

Fig. 1.

of causes comparatively little headway has been made in this country with electric car heating, although on the Continent and in America this system has been extensively used, no less than 40,000 cars running in city and interurban service being fitted with the type of heaters now described.

In the construction of the new types of electric heaters pressed steel has been substituted throughout for cast iron. This renders them practically indestructible, and reduces the weight from 30 per cent. to 50 per cent., when compared with the older types. Spot welding is employed in the manufacture of the heater cases, and also in attaching the hangers to the cases. This, of course, eliminates a considerable number of rivets which heretofore were used, and adds to the attractiveness of the heater. A perfect standard of sizes is maintained so as to ensure interchangeability of parts. The heater coils are made of specially selected galvanized iron wire, which experience has shown to be the best material for this purpose; these are perfectly supported

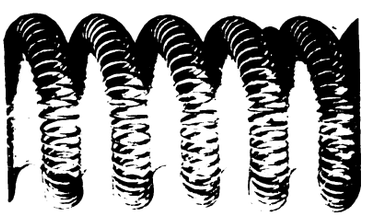

Fig. 2.

at every point and no vibration is possible. The spindle supporting the coil consists of an iron rod, on which are strung porcelain tubes which are so designed and fitted that a helical groove extends from end to end (Fig. 1). Specially designed eccentric porcelain bushings are placed on either end of the rod, and pass through the heater end plates. The wire for the heater coil is wound in a close spiral spring between the ridges on the porcelain spindle under tension. This method of construction gives the greatest amount of wire in the given space, and disposes every portion of the large surface presented so that the maximum quantity of air comes in contact with it (Fig. 3). The melting point of the heater coil is 2,925 deg. Fahr., and as the maximum temperature in service is only 400 deg. Fahr. it will be seen there is a large factor of safety.

An important feature of the new type of heater is the large amount of ventilation afforded for the radiation of heat. As lack of ventilation not only reduces the life of the heating element, but also

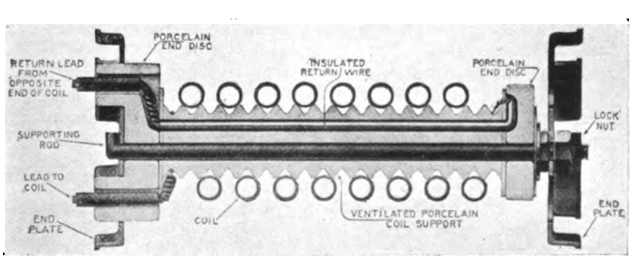

Fig. 3.—Sectional View of Heater Spindle.

causes the heater to operate at a high temperature, it will readily be seen how important this point is in the selection of a heater equipment.

The illustrations clearly show the formation of the heater coils, which embody ventilation spaces between each of the porcelain supports and the coil, and between each turn of the coil. The porcelain tubes have a glazed finish, which prevents the collection of dust. The loss of heat at the back of truss plank and panel heaters is prevented by the use of a circulating air space between the heater coil and the back; this method insures the delivery of all heated air into the car body.

The new designs embrace three types of heaters, viz., truss-plank heaters, cross-seat heaters, and the panel heater. Each of these is operated at 600 volts, and is made up with the standard heating elements. The first of these, when installed along the truss plank, occupies very little space, and when used in a continuous row provides the best possible distribution of heat. This type of heater is furnished without connecting wires, as the connections are made to binding posts at the ends of the heater coil. The cross-seat type is fitted with hangers of the universal pattern, which permit of the heater being installed under any of the different types of seats. It is claimed for this type that the best results are obtained by installing a heater under every seat, as by this arrangement they can be operated at a low wattage. In this type of heater all connection wires are brought out of the heater at one end; this is accomplished by running an insulated copper wire through the specially cored hole in the porcelain spindle, connecting it at one end to the heater coil, and at the opposite end to the supply wire. The arrangement of the connections, as well as the coil supports, will be seen from the sectional view shown in Fig. 3, and in the complete unit, as shown in Fig. 4. The heater shown in Fig. 5 contains two heating elements; the steel hangers are firmly

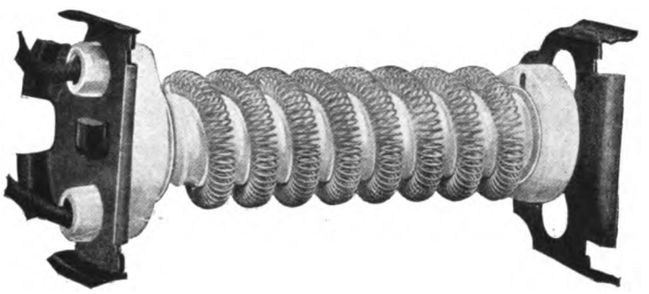

Fig. 4.

welded to the case, and are of the type which permit the heater to be readily applied directly to any type of cross seat.

The panel heaters are designed for cars with longitudinal seats, being placed in openings cut in the risers or heel boards. Steel front plates are used having perforations which permit of a free passage of the heated air into the car. The front plate of the heater will thus be flush with the riser, which should be well set back from the edge of the seat so as to prevent pocketing the heat. This heater is extremely light in weight, but strongly constructed, the front, back, and ends being of pressed steel. A junction box is provided for each end of the heater, so that when the connecting wires are carried in conduit, the conduit is held in place by a clamp at this point. Connections are then made to the binding posts on the heater coils, and the junction cap bolted into position. This type of heater is made in three sizes.

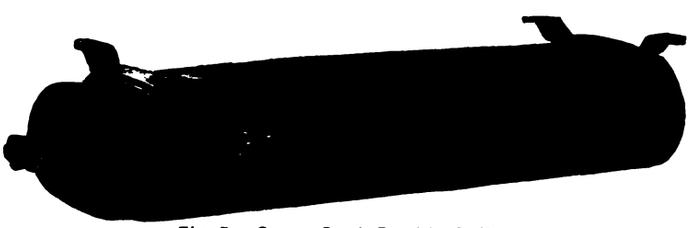

Fig. 5.—Cross-Seat Double-Coil Heater.

High-tension heaters for voltages ranging from 1,200 to 1,800 are also made in all three types. In the single-coil truss-plate type a deflector plate is fitted, which prevents the possibility of passengers receiving shocks; the heater coil cannot be reached through the perforations from outside the heater. In the double-coil cross-seat type, a double steel case is provided. The perforations are so arranged as to make it impossible to reach the heating elements from the outside. The junction box, which is of the split type, is held in place by the heater cases. The panel type for use on lines with 1,200 to 1,800 volts also has a double case with the perforations in each protected by solid metal. It is claimed that this method of construction offers no hindrance to the free circulation of the heated air, and positively prevents any contact with the heating elements from outside the case.

Thermostatic regulation for the 600-volt type of heater is claimed to be one of the most important developments in connecton with electric car heating, as by means of this system waste is absolutely prevented. The thermostat never allows any more current to be used by the heaters than is necessary to bring the car up to the required temperature, when this temperature is reached the current is automatically cut off. The temperature is maintained within 2½ degrees of the predetermined point, and thus gives a range of 5 degrees between the cutting-in and cutting-out temperatures.

# RATING APPEAL IN THE HOUSE OF LORDS.

COMMENT ON REMARKS OF LORD MOULTON.

A MISUNDERSTANDING OF THE LIGHT RAILWAYS ACT.

We have received from the Tramways and Light Railways Association the following correspondence which has passed between the chairman of the Association and the Lord Chancellor with regard to some remarks made by Lord Moulton when delivering judgment in the House of Lords in the rating appeal case of Tottenham Urban District Council *v.* Metropolitan Electric Tramways Company in June last. The judgment was reported in our issue of August 14, 1913.

The Right Honble. VISCOUNT HALDANE, K.T.

MY LORD,—The attention of the Tramways and Light Railways Association has been drawn to the expressions used by Lord Moulton in his judgment in the case of the Tottenham Urban District Council and Metropolitan Electric Tramways, Limited.

This was an appeal case on the question of the rating of tramways, and while my Association holds very strong views both on the judgment itself and the manner in which Lord Moulton arrived at the decision and announced it, I only desire on this occasion to draw attention to a complete misrepresentation by Lord Moulton of the action of tramway promoters under the Light Railways Act due to his ignorance of the history of the Act itself.

Lord Moulton in his judgment said:

"Tramway promoters were astute enough to see that undertakings which were purely and simply schemes for the construction of tramways in the ordinary sense of the word, might be put forward under the guise of being schemes for the construction of light railways, and that *if they could successfully elude the vigilance of the authorities*, they would thereby gain for the tramways the exceptional privileges intended only for undertakings of a widely different character. In this attempt they were only too successful, and by reason of *what I have no hesitation in regarding as an abuse of the Act*, schemes were sanctioned under the authority of the Light Railways Act, 1896, for the construction of what ought to have been regarded as tramways, and subjected to the carefully considered conclusions of the Legislature in respect thereto which are embodied in the Tramway Act."

This statement is both offensive and unjust. Mr. Ritchie, President of the Board of Trade, in introducing the Light Railways Bill, said:

"Under this bill a scheme for the construction of light railways might be proposed by local authorities such as a county, *town*, or district council, or by a railway company, a *tramway* company, a company *ad hoc*, or a combination of these."

He went on further to say:

"It was, perhaps, not generally known that local authorities could not at present make *tramways* without obtaining Parliamentary powers in some form or other, and even when such powere were obtained, they could not work the tramways except in special cases. This bill sought to remove those disabilities."

Mr. Ritchie also said:

"The bill of the Government would . . . afford facilities for making branches of existing railways upon a large scale, but with a different gauge if it were desired, and also for making such railways as in Belgium."

These Belgian railways are practically the same as our tramways.

Lord Dudley, in introducing the bill into the House of Lords, said:

"The bill included not merely all tramways, but all railways which the Board of Trade thought might justly be brought within its scope."

"*It certainly included tramways in towns*, and it might include trunk lines throughout the country."

If Lord Moulton had studied the history of the Light Railways Act, he would at least have refrained from making offensive remarks about those who have built up a great and beneficial industry under great difficulty and discouragement, and a knowledge of the real facts might have prevented him from adopting the biassed and prejudiced attitude which he thought fit to maintain throughout the hearing of the appeal.

I am, my Lord, your obedient servant,

(Signed) ARTHUR STANLEY, Chairman.

September 24, 1913.

---

MY DEAR STANLEY,—The Lord Chancellor has read your letter of the 24th inst. on behalf of the Tramways and Light Railways Association, and wishes me to write you in answer.

I am afraid that if the judge in a cause, after the judgments were delivered, were called upon to hear the criticisms of unsuccessful suitors, there would soon be an end of all legal decisions. The inconvenience of such a practice would be specially obvious in the case of the Final Court of Appeal, whose judgment is accepted as the final settlement of the law.

Believe me, yours truly,

(Signed) A. G. C. LIDDELL,

September 30, 1913. Private Secretary.

The Right Honble. VISCOUNT HALDANE, K.T.

MY LORD,—I beg to acknowledge the receipt of your reply to my letter of the 24th ult.

Mr. Liddell states that you read my letter, in which case I fear I must have expressed myself badly, as you have evidently misunderstood its meaning. If you will kindly refer to it again you will see that I did not criticise or find fault with the judgment in the case of Tottenham Urban District Council *v.* Metropolitan Electric Tramways Company, but that I thought it right, on behalf of those interested in the tramway industry, to point out to you that the statement of your colleague, Lord Moulton, to the effect that tramway promoters had made a wrong use of the Light Railways Act (constituting according to him, "an abuse of the Act") was absolutely unwarranted, and I further pointed out that even a cursory study of the history of the Act would have saved Lord Moulton from making a statement—in which you presumably concurred—which was both unfounded and unfair.

The judgment is irrevocable, and the only way in which we can make known our emphatic protest against the manner in which we have been treated by Lord Moulton and yourself is by publishing this correspondence, which I propose to do, after a few days' delay in case you should wish to reply to this letter.

I am, my Lord, your obedient servant,

(Signed) ARTHUR STANLEY, Chairman.

October 6, 1913.

---

House of Lords, S.W.,

October 11, 1913.

DEAR STANLEY,—I am desired by the Lord Chancellor to acknowledge the receipt of your letter of the 6th inst.

I am, yours truly,

(Signed) A. G. C. LIDDELL.

Hon. Arthur Stanley, M.P.

# TRAMWAY AND RAILLESS PROPOSALS.

BOLTON.—A bill is to be promoted for tramway extensions.

BOURNEMOUTH.—A considerable length of track is to be doubled and relaid, and the manager has been directed to report on the subject of providing omnibuses in connection with the tramways services.

BURNLEY.—The manager has been asked to report on the question of providing a tramway between Stoneyholme and Brunshaw Bottom.

CARDIFF.—For the purpose of preventing congestion, the track in Ninian Road is to be doubled at a cost of £6,010.

DUNFERMLINE.—In connection with the Council's town-planning scheme at Rosyth, the naval base, Mr. Balfour, of the Dunfermline and District Tramways Company, has stated that when the tramways are extended to the dockyard, the company would pay £1,000 per mile of double track, and £500 for single track, for road making on all sections of the roads where the tracks could, without detriment, be laid on ballast.

EDINBURGH.—A proposal for using the self-propelled car on the city tramways, and for its working in connection with the existing cable service, will be submitted to the Corporation by the Tramways Committee. A proposal for a new route from Craiglockhart cable terminus to Fir Hill, and to the existing tramway at Comiston Road, a distance of 5½ miles, has been postponed. Another scheme provides for an extension to Corstorphine, passing the Zoological Gardens, a distance of 1 mile 660 yards.

NEWCASTLE-ON-TYNE.—By the Tramways Committee a recommendation is to be brought forward in favour of promoting a bill to extend the tramways to Benton, in the district of Longbenton Council, and to run motor omnibuses from the terminus to the various centres of the Longbenton Council's area.

NEWPORT.—A scheme for running railless trolley cars within and without the borough, in the lower part of the Western Valley, is before the Tramways Committee.

NORTHAMPTON.—In February next the work of extending the tramways to Far Cotton, and doubling the Kingsthorpe Road section, is to be begun, the Corporation arriving at this decision at their October meeting. The Tramways Committee were instructed to consider the question of erecting shelters at various points on the present system.

NOTTINGHAM.—There is to be an extension of the tramways along Derby Road. It is not expected that the work will be started until March next.

PLYMOUTH.—It is proposed to apply for a Provisional Order for tramway extension to Crownhill at an estimated cost of £24,700, inclusive of four cars, and to Laira at an estimated cost of £30,348, inclusive of five cars. Owing to the cost which would be involved in obtaining an Act for running railless trolley cars, as against the small cost entailed by a Provisional Order for tramway extensions, the committee regretted that they were unable to submit reliable estimates relating to the former system.

PRESTON.—The Tramways Committee recommend the promotion of a bill for powers to extend the tramways on three routes.

C = Electric conduit system. E = Electric trolley system. H = Horse lines. S = Surface contact system. (a) Accident insurance fund. (b) Additional lines leased and worked. (c) Conferred by Annual Money Act, which limits amount for each financial year. Powers not exercised are lapsed. (d) Car depot extensions. (e) Includes 7 mi. 34·53 chs. single track lines leased. (f) Unlimited. (h) Includes 1¼ miles railless trolley route. (i) 17 mi. 8 chn. single track leased. (j) Including £574 accident insurance fund. (k) Not including 10 miles 3 chains single track lines leased. (l) Including Insurance.
† Reports inserted for the financial year 1912-13.

## FINANCIAL REPORTS AND MEETINGS.

**Sao Paulo Tramway, Light, and Power.**—The usual quarterly dividend of 2½ per cent. has been declared.

**Anglo-Argentine Tramways.**—The directors have declared an interim dividend of 4 per cent. for the half-year.

**Babcock and Wilcox, Limited.**—The directors announce an interim dividend of 7 per cent. on the ordinary shares for the half-year.

**Brazilian Traction, Light, and Power.**—The directors have declared a dividend of 1½ per cent. on the issued ordinary capital stock.

**Lisbon Electric Tramways.**—An interim dividend of 3 per cent., free of income tax, on account of earnings of current year, has been declared on ordinary shares.

**Calcutta Tramways Company.**—An interim dividend at the rate of 5 per cent. per annum (2s. 6d. per share) on ordinary shares for the half-year is announced.

**Hong Kong Tramway Company.**—The board announce an interim dividend at the rate of 5 per cent. per annum, free of tax, for the six months ended June 30.

**Brisbane Electric Tramways Investment Company.**—An interim dividend at the rate of 8 per cent. per annum (4s. per share) has been declared on the ordinary shares for the half-year.

**Cape Electric Tramways Company.**—The profits for the year ended June 30 were £80,978. To the reserve fund £8,000 has been added, and a dividend of 5 per cent., free of tax, is proposed on ordinary shares, leaving £2,517 to carry forward.

**Sale of Cheltenham and District Light Railway.**—This undertaking, which was opened by the late Mr. T. Nevins in 1901, has been disposed of to J. G. White and Company and Balfour, Beatty, and Company for, it is stated, between £99,000 and £100,000.

**New St. Helens and District Tramways Company.**—The net profits for the year ended June 30, including £901 brought forward, were £4,422. There has been transferred to the reserve £1,000, and a dividend of 2½ per cent. has been declared on the preference shares, leaving arrears of 50½ per cent., and £1,424 carried forward.

**Ferranti, Limited.**—After payment of all charges and expenses of the recent issue of five-year notes, the net profit for the year ended June 30 was £28,142, comparing with £24,333 in the previous year. After payment of debenture and other interests, £10,000 is placed to depreciation and £22,000 to general reserve, carrying forward £452, against £1,245 brought in.

**Record Half-Year at Leeds.**—The earnings of the Leeds tramways for the half-year ended September 30 amounted to the record total of £223,059, an increase of £14,581 as compared with the total for the corresponding half of the last financial year. The passengers carried numbered 47,996,569. The district served by the tramways comprises a population of 525,000, and the average amount expended in car fares per head of the population during the half-year is calculated at 8s. 5d.

**British Interchangeable Rail Company.**—This private company has been registered with a capital of £15,000 in £1 shares, to acquire patents No. 646 of 1911 and 2,466 of 1913, and adopt an agreement with H. Crudgington and H. T. Wakelam. The subscribers are: H. Crudgington, King's Heath, metal merchant; F. W. Alabaster, Birmingham, merchant. The directors are F. N. Layman, E. Randle, E. Grantham, and H. Crudgington. The registered office is at 28, Victoria Street, London, S.W.

**Manchester's Half-Yearly Results.**—Mr. J. M. McElroy has presented his summary of the results of the working of the tramways department during the first half of the financial year. The mileage run was 9,769,574, an increase of 324,047 as compared with the corresponding period of 1912, and the passengers carried numbered 102,144,962, an increase of 9,926,230. The electrical energy used was 726,927 units fewer—14,673,871 as compared with 15,400,798—and the units per car-mile were reduced by ·128—1·502 as compared with 1·630. The revenue per car-mile was at the same time increased from 11·369d. to 11·561d., but the working expenses per car-mile were only increased from 7·002d. to 7·036d.

**Record Nine Months at Liverpool.**—At the last meeting of the expiring municipal year of the Liverpool Tramways Committee, Alderman Fred Smith reported that the first nine months of the present year had proved a record, both as regarded receipts, number of passengers carried, and receipts per car-mile. The receipts amounted to £505,016, compared with £469,016 in 1912, an increase of £36,000, or 7·67 per cent. The passengers numbered 107,457,935, against 99,903,672, an increase of 7,554,263, or 7·56 per cent. The mileage was 10,034,045, against 9,349,669, an increase of 684,376, or 7·32 per cent.; and the earnings per car-mile were 12·07d., against 12·04d., an increase of ·03d.

**The Half-Year at Bradford.**—The tramway receipts for the half-year ended September 30 show that the receipts amount to £158,622, as compared with £147,901 in the corresponding half of 1912. This is an increase in receipts of £10,721, or 7 per cent. The car-miles run were 3,156,070, as compared with 3,033,869, an increase of 122,201 miles, or 4 per cent. The passengers carried during the half-year numbered 34,227,530, as against 31,009,972 in the corresponding six months of last year, an increase of 3,217,558, or 10 per cent. The cost per car-mile has increased owing to the advance of wages to practically every member of the staff, the payment of full sickness benefits to men who are absent from duty owing to illness, and track maintenance costs.

**Melbourne Tramway and Omnibus Company.**—The directors' report shows that the balance remaining after paying 3s. per share in dividends and bonuses for the year, and including £95,991 brought forward from last year, was £202,754. From this they proposed to pay a final bonus of 1s. per share, £48,000; to carry to reserve for return of capital, making it £480,000, £105,741; leaving to carry forward £49,013. The traffic receipts for the year to June 30 improved by £34,181, and 4,284,810 more passengers were carried than during the previous year. The negotiations for the sale of the company's business to the Government that were in progress at the time of the last report ultimately lapsed. For the quarter ended September 30 the directors announced a dividend of 6d. per share and also a bonus of 6d. per share.

**Norwich Electric Tramways Company.**—For the year ended June 30, after providing for debenture interest, etc., and including £575 brought forward, the net profits were £10,561. The directors propose to transfer £2,500 to reserve (raising that fund to £15,179), and recommend a dividend of 3 per cent., leaving £141.—The Hon. Arthur Brand, who presided at the 17th annual meeting on October 29, remarked with pleasure on the facts that the tramways had done better than in the previous year, and that there had been a very considerable increase in the earnings. He mentioned that it was intended to promote a Bill in Parliament to make further improvements in the system. A dividend of 3 per cent. for the year was sanctioned. Mr. Chamberlain was reappointed representative director for the city of Norwich, and Mr. Hopkins, retiring director, was re-elected.

**New South Wales Tramways.**—The report of the Tramways Department for the year ended June 30 last states that the rolling stock consisted of 20 steam motors, 70 steam cars, 1,182 electric motor and 38 trailer cars, and 95 service and other vehicles. The total electric current output for the year at the Ultimo power-house was 89,113,036 kilowatt-hours, of which the alternating-current supply was 78,090,695 kilowatt-hours, and the direct-current 11,022,341. Eight and a half miles of track were treated for corrugations with the Carborundum rail grinder. On June 30 there were 207¾ miles opened for traffic, 12¼ miles having been opened during the year. The total capital expenditure on lines open for traffic amounts to £6,699,305. Seventy-two fronts of cars were enclosed with glass work. The tramways staff numbers 9,170, and during the year the value of the concessions and advances made to the tramways staff, all grades, equalled £282,230 per annum.

**Preston Corporation Tramways.**—In his report for the year ended March 31, Mr. J. F. Simpson, engineer and manager, states that there was an increase in revenue of £2,623, and an addition of 567,296 in passengers. The income was £43,270, and the expenses £24,065. The special charges include three new cars costing £2,412, covering top decks of five cars, new plates for accumulators, etc. The new cars, which are of the single-deck saloon type, and each seating 42 passengers, were built by the United Electric Car Company, the electrical equipment being supplied by Dick, Kerr, and Company. In view of the success of the undertaking, the manager thinks that extensions to outlying districts might seriously be considered, "especially in view of the success that has attended the introduction of methods of traction which do not necessitate the use of expensive permanent way." The car-mileage was 970,719 miles, the average number of car-miles per car per day being 132 miles. The energy consumption was 1·309 units per car-mile, the power costs per unit being ·384d., with an average power cost per car-mile of ·600d. The ratio of working expenses decreased from 59·22 to 55·63 per cent.

**Hurst, Nelson, and Company.**—Sir Thomas Mason, D.L., presided at the annual meeting in Glasgow on October 16. The chairman, in moving the adoption of the report and accounts, made reference to the loss sustained through the death of Mr. Andrew S. Nelson, manager and founder of the business. Mr. Nelson, he said, had been looking forward with great hopes to the result of the year's working. The profits were a matter for congratulation. The results obtained were more favourable than those of previous years, and altogether the balance sheet showed a greatly improved position. They had been able to write off the whole balance of the expenses connected with the formation of the company. He moved that the arrears of the dividend on the preference shares be paid at the rate of 6 per cent., that a dividend of 6 per cent. on the preference share capital from May 15 to November 11 this year be paid, that £5,650 be reserved to pay on May 15 next a half-year's dividend, and that £10,000 be placed to a special reserve fund for security of dividends on the preference share capital. He also moved that a dividend on the ordinary shares of 5s. per share be paid, and that £2,257 be carried forward.

## PERSONAL.

**Mr. H. A. Goodyer,** of Walsall, has been appointed chief clerk in Coventry Corporation tramways department.

**Mr. Frank Buckley,** tramways manager to Wigan Corporation, has been granted an increase in salary of £25 per annum.

**Mr. W. H. Milnes,** assistant engineer, Coventry Corporation Tramways, has had his salary increased from £180 to £200 per annum.

**Dr. Hans Goldschmidt,** whose name is well known in connection with the patent alumino thermic process, has been granted the title of Professor.

**Mr. H. S. Banner** has been appointed an inspector on the Southport Corporation tramways. Mr. Banner entered the service in May, 1902.

**Mr. A. T. Goward,** manager of the British Colombia Electric Railway Company at Victoria, has left that city on a visit to the directors in London.

**Mr. J. E. Waller** has been paid £52 10s. for professional services rendered in connection with the tramways provisions of the Coventry Corporation Act, 1913.

**Mr. Arthur Kenworthy,** chief electrical engineer to Barnsley and District Electric Traction Company, was married to Miss Morris, at Barnsley, on October 22.

**Mr. J. R. Taylor,** chief clerk, Ashton tramways department, has resigned consequent upon having been appointed to a similar position at Walsall, his native town.

**Mr. H. J. Somerset** has retired from the position of manager of the Perth (W.A.) Tramways, which have been purchased by the Government, and is returning to England.

**Mr. J. Willey,** late rolling stock foreman, Isle of Thanet Electric Tramways Company, has been presented with an oak writing desk and an oak umbrella stand on the occasion of his departure to enter a local business.

**Alderman Linsley,** chairman of Salford Corporation Tramways Committee, and the new president of the Municipal Tramways Association, is the first president elected from outside the ranks of tramway managers.

**Mr. A. M. B. Grahame** was appointed managing director of Hurst, Nelson, and Company at the annual meeting of the shareholders, in the place of the late Mr. Andrew S. Nelson. Mr. George W. Chalmers, works manager, was elected a director.

**Mr. E. J. Doran,** after acting for six months as assistant tramway traffic superintendent of the New South Wales Tramways at Sydney, during the absence of Mr. H. F. Brown, on leave of absence prior to retirement, has received the permanent appointment to that position.

**Sir John Courtis,** chairman of Cardiff Tramways Committee, speaking at a luncheon given in connection with Grove House by the Cardiff Corporation, said he had returned from his Canadian tour with big ideas, after seeing some of the cities there, as to what Cardiff should do.

**Mr. G. C. I. Stuart,** of the Manchester Council's electricity works, and formerly resident engineer at the Brakpan power-station of the Victoria Falls and Transvaal Power Company, has been appointed superintendent of the Buenos Ayres power-station of the Central Argentine Railway.

**Councillor Hargreaves, J.P.,** vice-chairman of Hull Tramways Committee, has accepted an invitation to become mayor of the city. Mr. and Mrs. Hargreaves recently opened a bazaar, at which £120 was raised for the tramways band, and they were congratulated by Mr. W. J. McCombe, the manager, on the honour about to be conferred upon them by the Corporation.

**Mr. J. Dalrymple,** Glasgow tramways manager, and Mr. Nisbet, master of works, on October 1 had reached Vancouver in the course of their tour to inspect tramway systems and bridges. They were greeted by many former employees of the Glasgow Corporation, nearly a hundred ex-Glasgow tramwaymen now being employed on the tramways, etc. The travellers arrived at Glasgow on October 27.

**Mr. C. W. G. Little,** chief electrical engineer of the British Electrical Federation, Limited, on behalf of the Swansea Improvements and Tramways Company, who are lessees of the Mumbles Railway and Pier undertaking, is advising the company on the subject of the proposed electrification of the railway from Swansea to the Mumbles, which was described and illustrated in our issue of June 13, 1912.

**Mr. Alfred Clough,** late resident electrical engineer to the Liverpool Corporation, has been presented with two divan chairs and an illuminated address by the electric supply department. The presentation was made by Alderman Fred Smith, chairman of the Tramways and Electrical Power Committee, who was supported by Mr. C. W. Mallins (tramways manager), Mr. H. Dickenson (city electrical engineer), etc.

**Mr. G. Cardwell,** general manager of the Devonport and District Tramways Company, has been presented with a silver tea and coffee urn by the staff and employees on the occasion of his marriage. The presentation took place at a dinner and smoking concert, Inspector Murton presiding. Acting Chief Inspector Goodridge made the presentation, and on behalf of the staff wished Mr. and Mrs. Cardwell the best of health. Mr. Cardwell thanked the donors for their kindness.

**Mr. Leonard Johnston** has been congratulated by Gloucester Tramways Committee upon obtaining the appointment of manager of the Southampton Corporation Tramways, where he began duty in the third week of October. Alderman Talbot, chairman of the committee, mentioned that a deputation from Southampton visited the city in connection with the appointment. Alderman Dunsford, the chairman of the Southampton Tramways Committee, went to the depôt and looked over everything, and was very pleased with what he saw. He also went over the track and examined it very minutely, and afterwards said that Gloucester had a system of which it ought to be proud.

**Mr. Peter Fisher,** manager of the Dundee Tramways, and Mr. Robertson, manager of the Greenock Council's electricity department, have been consulted by the Stirling Corporation with regard to Messrs. Balfour, Beattie, and Company's offer to carry out the electrification of the tramways and to purchase the power-station. Mr. Fisher has been congratulated by Dundee Tramways Committee on his election as vice-president of the Municipal Tramways Association, which will meet at Dundee in 1915. Convener G. A. Johnston observed that the appointment was a compliment to Dundee as well as to Mr. Fisher, who was recoguised as being a thoroughly up-to-date tramway manager.

**Dinner to Mr. and Mrs. Wyld.**—Mr. W. Wyld (late manager of the Birkenhead Electricity Supply Company and Tramway Department) and Mrs. Wyld were entertained by a number of friends to dinner at the Imperial Restaurant, Regent Street, W., on October 3, to welcome them to London and to congratulate Mr. Wyld on his appointment as borough electrical engineer to Hampstead Corporation. The chair was taken by Mr. H. E. Blain, who, after the loyal toast, proposed the health of the guests. Mr. Wyld responded, and gave a biographical sketch of his career. Commencing with Blackpool, he took the company in imagination to Salford, Wednesbury, Doncaster, and Birkenhead, and finally to Hampstead, with which he expressed great satisfaction.

**Alderman Fred Smith,** whose accession to the chair of the Liverpool Tramways Electric Power and Lighting Committee last year was marked by considerable discussion, was, on October 10, at the closing meeting of the committee for the municipal year, accorded a vote of thanks on the motion of Major Clarke, seconded by Mr. Hutchinson, and supported by Councillors Clancy, Gates, and Robinson. In responding, he remarked that he was in his fifteenth year of service on the Tramways Committee. He had every reason to be thankful for the help that had been given to him by every member of the committee and all the officials attached to the committee. He moved a vote of thanks to the deputy-chairman, Major Clarke, who, he said, had been very helpful to him in the work of the committee. He had never seen a member of the Council who had taken more work in hand. Councillor W. J. Bailes was thanked for his services as chairman of the Electrical Sub-Committee.

**Mr. J. S. D. Moffet** has been presented with a canteen of cutlery by the chief officers of Rochdale Council upon his departure to take up the duties of general manager of the West Ham Tramways. The gift was handed over by Mr. T. R. Ball, the gasworks manager, and speeches were also made by Mr. W. H. Hickson (town clerk), Mr. S. Platt, and Mr. G. Webster, the new manager of the tramways. The town clerk referred to the able assistance he received from Mr. Moffet in connection with Parliamentary bill work. Mr. L. S. Platt, borough surveyor, mentioned that Mr. Moffet came to Rochdale as one of his assistants. He paid tribute to the efficiency with which he superintended the construction of the tramways. Having been so closely associated with the initial work, following the municipalisation of the system, it was fitting that Mr. Moffet should obtain the general managership. All through the years of Mr. Moffet's service in Rochdale they had been in most friendly co-operation.

**Local Government Officers' Presentation to Mr. H. E. Blain.**—At the annual dinner of the National Association of Local Government Officers on October 18, Mr. H. E. Blain, late general manager of the West Ham Corporation Tramways, was the recipient of a handsome token of the regard in which he is held by the members. Mr. H. E. Blain was one of the founders, and it is chiefly as a result of his efforts that the Association holds such a strong position. Opportunity was taken of Mr. Blain's retirement from the municipal service to make a presentation to him in recognition of his valuable work. Sir Homewood Crawford, city solicitor, London, and president of the Association, proposed the health of Mr. Blain, and on behalf of himself and the members presented him with a handsome solid silver Georgian tray and a gold watch and chain, both bearing the following inscription: "Presented to Herbert E. Blain, Esq., by the president and members

Digitized by Google

of the National Association of Local Government Officers as a slight appreciation of his valuable work for the Association particularly, and in the interests of the Local Government Service generally." The president referred to the great regard in which Mr. Blain is held by all local government officers, and to the severe loss to local government, which his recent appointment necessitates. Mr. Blain was received with prolonged cheers on rising to respond to the toast, after which he returned thanks to the members, and expressed himself unable to voice his deep sense of appreciation of the kindly feeling shown him by the whole of the members.

**Mr. G. F. Milnes,** whose death at Birkenhead is announced, was for many years connected with the firm of G. F. Milnes and Company, which ultimately became absorbed in the United Electric Car Company, Limited. Mr. Milnes was afterwards the resident representative of that company in London. His son, Mr. G. C. Milnes, who is now in Alberta, and Mr. Voss established the firm of Milnes, Voss, and Company, of which Mr. Voss is now the head.

**Mr. J. H. Cawthra,** who, during the past two years had been chief mechanical engineer to the Victoria Falls and Transvaal Power Company, died on October 8 from injuries received while he was motoring near Johannesburg, the car colliding with a train at a level crossing. Mr. Cawthra was from 1901 borough electrical engineer at South Shields, and he had also held a similar position at Swansea. He had also held the appointment of chief assistant electrical engineer at Leeds electricity works.

## CONTRACTS AND ORDERS.

**Chamberlain and Hookham, Limited,** have a contract from Cleethorpes Urban District Council for prepayment meters.

**United Electric Car Company,** of Preston, have received a contract to supply two top-deck covers for cars to Lancaster Council.

**Bury Council** have accepted the tender of J. Musgrave and Sons for the supply of a 3,000-KW. turbo-alternator with exciter and surface condenser.

**Blackpool Council** have sealed a contract with Richardsons, Westgarth, and Company for the supply of a 1,000-KW. turbo-generator and condensing plant.

**The "M and G" Truck and Engineering Company, Limited,** have secured from Aberdeen Corporation the contract for six trucks of their rigid wheel base, 21 E.M. type.

**The Canadian General Electric Company** have secured the contract for the electrification of the Mount Royal Tunnel of the Canadian Northern Railway, which is to open up the suburbs of Montreal.

**Dundee Tramways Committee** have accepted the tender of Mr. D. Horsburgh for excavating, concreting, and paving, etc., the road in connection with the extension of the Blackness Road tramways, at £6,471.

**Ramsbottom Council** have accepted the tender of the Polack Tyre and Rubber Company, Limited, Manchester, for tyres for the railless trolley cars for twelve months, and of Mr. Rawlinson for a tower wagon.

**Walthamstow Council** have accepted the tender of J. Baker and Company for a supply of a dozen special tramcar axles at £3 3s. per axle, and that of W. T. Henley's Telegraph Works, Limited, for a supply of feeder cable.

**Clough, Smith, and Company, Limited,** Spencer House, South Place, London, E.C., have secured from Keighley Corporation the contract for the erection of the 6,600-volt high-tension transmission line between Keighley and Bingley.

**Derby Council** have accepted the following tenders: British Thomson-Houston Company, Limited, switch gear, £943; Simkiss and Knighton, cast-iron piping for turbine, £246; Aiton and Company, steel piping for turbine, £142; Newton Brothers, balancer, £179.

**Hurst, Nelson, and Company** have received a contract from Leeds Corporation for the supply of car bodies and trucks, at £12,850. Alderman Tetley informed the Council that their own car works could not turn out the cars sufficiently quickly, and that this tender was practically the lowest one received.

**Messrs. Belliss and Morcom and Siemens Brothers** have supplied the turbine and generating plant installed in the Croydon Corporation electricity station. The capacity is about 3,000 H.P., and the cost £7,000. The turbines can be worked either with high-pressure steam or with exhaust steam, and a great saving in the coal bill is thereby anticipated.

**Sheffield Council** have accepted the following tenders: Tramway tie bars and anchor joints, Bayliss, Jones, and Bayliss, Limited, Dorman, Long and Company, Limited; tramway rails, Steel, Peech and Tozer, Limited; e.h.t. switch gear at Neepsend Station (extension of contract by four additional panels), A. Reyrolle and Company, Limited, Hebburn-on-Tyne, at £2,453.

**The National Rail and Tramway Appliances Company, Limited,** have contracts in hand at the present time for 70 tons of brake blocks for various Government railways. They are also supplying, among other contracts, brake blocks to the Metropolitan Railway, and 7,000 blocks to the London, Brighton, and South Coast Railway.

**Cardiff Council** have accepted the tender of Messrs. Fraser and Chalmers for a turbo-generator for the Roath power-station at £6,345, and the tender of the British Westinghouse Company for a 1,000-KW. rotary converter, for the Hayes sub-station, at £1,955. Mr. A. Ellis, the electrical engineer, recommended the purchase of the 1,000-KW. converter, instead of a 700-KW. plant, as the larger one would ultimately effect a saving in cost and space.

**Glasgow Tramways Committee** have awarded contracts as subjoined: Steel traction poles, Stewarts and Lloyds, Limited; copper collector bushes, General Electric Company, Limited; motor gear cases, Electrical Engineering and Equipment Company, Limited; bastian radiators, Gillespie and Beales; lighting fittings, Falk, Stadelman, and Company, Limited; supplying and fitting up an electric clock at the junction of two roads, W. Silvester and Company.

**The Great Western Railway** have placed an order with the Railway Track Supply Company (of Great Britain), 81, Gracechurch Street, London, E.C., for one Buckwalter electric industrial truck, for use at their Swindon works. This, we believe, is the first truck of its kind ordered for use in Great Britain. The manufacturers of the Buckwalter trucks have standardised four types of trucks for railway platforms, locomotives machine shops, docks, etc. Further particulars can be obtained from the Railway Track Supply Company on application.

**Bradford Corporation** have ordered 20 Dick-Kerr standard 40-H.P. motors, at £104 each, for the tramcars running between Bradford and Leeds. Tenders for supplies to the tramways department have been placed as follow: Tangyes, Limited, armature winding machine, £88, wheel-turning lathe, £808; Leeds Engineering and Hydraulic Company, Limited, two sets hydraulic jacks, £230; J. Keith and Blackman Company, Limited, smiths' hearths (two single and one double), £81; Carrick and Ritchie, travelling crane, £535; F. Parker and Company, Manchester, Beecroft and Wightman, Limited, Bradford, and J. Rhodes and Company, Limited, Bradford, supplies of timber for tramcar bodies.

**London County Council** have entered into contracts as under: Kerrige and Shaw, provision of foundations required in connection with the substitution of turbines for reciprocating engines at Greenwich power-station; British Westinghouse Company, high-tension switch gear, etc., for Greenwich power-station, £17,915; J. Cochrane and Sons, laying condensing water pipes in the bed of the River Thames at Greenwich power-station; Electrical Installations, Limited, wiring of Camberwell and Cressy Road car sheds, £2,146; H. L. Holloway, foundations for rotary converters to be installed at Shoreditch sub-station, and additional workshop accommodation, etc.; British Westinghouse Company, 13 reactance coils and two steel valve chests required in connection with the provision of protective devices for the existing plant at Greenwich power-station, £5,943; Hadfields Steel Foundry Company, special trackwork for junction lines at Tooting Broadway, £1,800; Ashworth, Son, and Company, Dewsbury, 20-ton weigh-bridge for Belvedere Road depot, £136; National Rail and Tramway Appliances Company, five hydraulic pit-jacks, £35 10s. each; Carborundum Company, rail grinding blocks for the next 12 months, 4s. 6d. per block, less 2½ per cent. discount, total amount about £270; J. G. Ingram and Son, repair of 196 india-rubber plough bases burnt, etc., estimated cost £196 13s.; John Brown and Company, 18 tons special hard-rolled steel plates, £219 (approximately); John Brown and Company, 45 bars of insert steel, £192 (approximately); R. R. Todd, High Holborn, 520 copper bonds, £127; Anderston Foundry Company, 200 cast-iron extended arm yokes and 200 cast-iron short yokes, £290 15s.; Brecknell, Munro, and Rogers, 1,500 trolley wheels, £193 15s.; Imperial Light, Limited, Westminster, 36 acetylene lamps, 1,000 c.p., £135; Bayliss, Jones, and Bayliss, 2,000 tie rods for extended yokes, £193. Messrs. Babcock and Wilcox have supplied 5,000 chain stoker links at £18 12s. a thousand, and 5,000 links at £28 a thousand, for use at Greenwich generating station.

**Rejection of the Sydney Underground Scheme.**—On October 14 the Legislative Council rejected the bill, already passed by the House of Assembly, authorising the construction of an underground railway and tramways in Sydney, at an estimated cost of £4,800,000.

**Bournemouth and Investment of Renewals Fund.**—In his report on the tramways undertaking the borough auditor says that when a transfer to renewals fund has been made, it is incumbent upon them, pursuant to the Corporation Act, 1901, to invest such funds in authorised securities. Having regard to this provision the transfer to renewals fund has not, it would seem, been carried out in the manner enjoined by the statute.

## TRAMWAY AND LIGHT RAILWAY NOTES.

**ABERDEEN.**—Application has been made to the Board of Trade by the Aberdeen Suburban Tramways Company for permission to run trail cars. It has been granted on condition that a loop is provided.

**BOLTON.**—Power to run trail and coupled cars is being applied for by the Corporation. Five tramway extensions are also proposed.

**BOURNEMOUTH.**—The tramways manager has informed the Tramways Committee that he has arranged a simple method for ventilating the cars. As the result of their inspection of two cars so fitted, the Committee have approved the arrangement.

**BRADFORD.**—It is proposed to erect a new and larger district depot at the junction of Bolton and Idle Roads for the tramways department, and to provide additional car accommodation at Thornbury.

**CARDIFF.**—An important section of the tramways, consisting only of single line, is to be doubled. Sir John Courtis, chairman of the Tramways Committee, recently defended the action of the management in undertaking the work in order to relieve congestion and to increase facilities. Sir John added that there were many places in the city where the need exists, and in the course of the discussion it transpired that land is being purchased in order that another length of track may be duplicated.

**GLASGOW.**—The City Council have, by 19 votes to 16 adopted the following motion by Councillor Shedden: "That as a means of solving the question of congestion on the streets, and of giving facilities towards the expansion of the city, the Corporation appoint a special committee to consider and report as to the feasibility of establishing a system of tube electric railways from east to west (say Shettleston to Clydebank), and from north to south (say Bishopbriggs to Rouken Glen)." During the past quarter inspectors in plain clothes have been engaged in travelling on the Glasgow tramcars, with a view to detecting contraventions of the bylaws. Between July 25 and October 11 they noted 223 cases of spitting on cars, and also a large number of cases of children hanging on to the rear of the cars. In all, no fewer than 848 offences of various kinds have been booked.

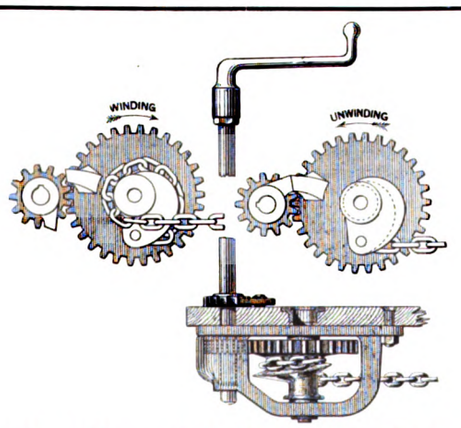
**GRIMSBY.**—The Tramways Committee have been directed to consider the question of asking the Tramways Company to convert all their open top deck cars into covered tops.

**LEEDS.**—The Leeds Tramways and Electricity Committee propose asking the Board of Trade for sanction to borrow £45,000 for the purpose of providing new tramcars for the city. It is also intended to apply the side life-guard to the whole of the cars.

**LIVERPOOL.**—Reviewing the work of the past year on October 10, Alderman F. Smith, chairman of the Tramways Committee, mentioned that on February 16 they decided to have a sample car built of the new type designed by the general manager, with a separate entrance and exit both from the lower and upper decks. The car was found to be very popular, and the Committee decided to build six more of the same type, two of which were already in the service, and had proved most satisfactory, the remaining four being in course of construction. The Committee on January 17 decided to try experimentally automatic point controllers. Two of these appliances were put into service, and one had proved very satisfactory, whilst the other had not proved quite so satisfactory. The system of collecting the fares from passengers as they entered the cars had been tried experimentally for three months, but at the time of the maximum traffic it was found impossible to carry it out to the full extent. The general manager, however, was of opinion that it was helpful to the conductor to collect as many fares as possible on the platform without causing delay.

**LONDON.**—Motor omnibus competition has awakened the County Council to the need for advertising tramway facilities in relation to the education service. The various steps which have been taken in the matter were reported to the Council on October 14, when, on the recommendation of the Highways Committee, the Council rescinded the resolution passed on July 8, authorising the invitation of tenders for the provision of illuminated signs in connection with the advertising of tramway service on tramway buildings and other sites. At the same meeting Mr. G. H. Hume, on behalf of the Highways Committee, said that the Council were at present operating eight trail cars. The results had been satisfactory. The certificate of the Board of Trade was only provisional; when the final certificate was received the extension of the trail car system would be fully dealt with. Applications for increased pay by mechanicians in the tramway workshops and by car washers have been referred to the Conciliation Board. The washers have asked for an increase of 3s. a week. There are at present 735 regular washers and 115 spare washers. The rate of pay commences at 27s. 6d. a week, rising to 30s. Spare washers are paid 4s. 7d. a night. On October 21, the Highways Committee recommended that the pay of regulators and inspectors be increased from £2 2s. to £2 5s. a week, at an estimated cost of £250 a year. A report was presented on October 21 stating that the institution in July, 1912, of 3d. single and 5d. return fares for maximum distances, and of return tickets at reduced fares between intermediate points, had resulted in a marked increase in the number of passengers.

# 5,258 BRAKES SOLD IN 90 DAYS!



## The "Peacock" IMPROVED Brake.

(PATENT).

Note the simplicity of the Radial Contact pieces which render this the quickest of all geared hand brakes by

(1) Preventing the drum from over-running on release;

(2) Stopping the drum always at the point from which recovery of chain is most rapid;

(3) Eliminating all idle turning of the handle.

Metropolitan Building,
New York City, August 26, 1913.

J. McI. Cater, Manager,
Peacock Brake Co.,
London, England.

Dear Mr. Cater:

It affords me pleasure and is only fair to inform you that the Peacock Improved Brake, shipped by you from England last Fall, was tested under the supervision of the Public Service Commission of this State, and was awarded the highest percentage for efficiency over all other hand-geared brakes - and, rest assured; they were all there. The outcome of this test resulted in the National Brake Co., of Buffalo, N. Y., immediately purchasing the rights from me to manufacture and sell the Peacock Improved Brake in the United States.

We have thus far only shown it to the companies mentioned below who have purchased the following number of brakes within the last ninety days.

| | |
|---|---|
| The Brooklyn Rapid Transit Co. | 4036 |
| Second Avenue Railway Co. | 550 |
| New York Street Railways Co. | 440 |
| Third Avenue Railway Co. | 102 |
| Belt Line Railway Co. | 80 |
| Manhattan & Queens | 50 |
| Total Number Brakes Sold | 5258 |

To my mind your success in Europe, and the initial sales in the United States, speak well for the future of the Peacock Improved Brake.

Yours sincerely,

The "PEACOCK" BRAKE CO., 27, Clements Lane, LONDON, E.C.

Digitized by Google

**NORWICH.**—A portion of the track is being doubled, and the general situation has been reviewed as regards the lay-out in connection with the renewal of points and crossings. Mr. F. W. Ketley, the manager and engineer to the Tramways Company, states that this is necessary for the purpose of meeting the altered traffic conditions brought about by motor traffic. He has further stated that at the present rate of increase of speed effected by mechanical traction, the tramcar will soon be among the slowest unless powers for speeding up are granted.

**SHEFFIELD.**—The Corporation, on October 22, adopted on the recommendation of the Tramways Committee, a report from the general manager advising that time-and-a-half rate of pay be given for all Sunday work to all employees who had completed five years' service who were not at present in receipt of time-and-a-half or a higher rate for such work. All employees now get time-and-a-quarter, which was granted in July, 1906, at a cost of £2,028 per annum. The new concession would cost £540 a year, and Mr. Fearnley stated that if it was granted a number of applications which he had received for increases in wages might be considered disposed of. This action disposes of the differences between the employees and the Tramways Committee, which were to have been submitted to arbitration.

**SOUTHPORT.**—The Tramways Committee have directed two members and the manager to investigate the question of running cars on the trackless trolley system, as authorised by the new local Act, and to see Mr. J. B. Hamilton, and report to the Committee.

**STOKE.**—The Potteries Electric Traction Company have decided to place time indicators at the Trent Vale and Dresden termini, but have informed Stoke Council that they are unable to install illuminated route indicators. The company, however, are experimenting with a device which they hope will meet the situation.

## PATENT LIST.

**Specially abstracted for "The Tramway and Railway World" from the Official Journal of Patents.**

*** If the inventions have been communicated the names of the communicators are given below in italics

### APPLICATIONS.

Applications for Letters Patent have been filed:

21,880 Signalling on railways—T A Holroyd and W. H. Holroyd.
22,007 Switches and points for tramways and railways—H. Mozley, F. S. Whitaker, and F. Bland.
22,020 Brake mechanism—F. H. Royce and Rolls-Royce, Limited.
22,029 Railway signalling systems—Soc. Anon., Westinghouse.
22,047 Keys for securing rails to chairs—R. D. Hughes, D. Hughes, and W. Davies.
22,062 Automatic device for stopping trains—A. W. Reader.
22,082 Railway safe-running devices—A. R. Angus.
22,084 Railway signalling—A. H. Farman and F. H. Bassano.
22,123 Railway signalling apparatus—H. L. Vahey.
22,127 Switches for railways—Soc. d'Electricité Mors.
22,184 Mechanical device for automatically stopping trains on passing signals at danger—W. Seward and C. E. Morgan.
22,224 Electro-pneumatic air-brake systems — British Thomson-Houston Company, Limited (*General Electric Company*).
22,264 Railway signalling apparatus—H. Fanton.
22,266 Method of controlling and regulating trains—T. Barbour and W. S. Suffern.
22,276 Tramcars—G. Ashton.
22,292 Revolving and self-adjusting splash-guard for motor omnibuses—M. B. Jack.
22,371 Emergency control of railway trains—J. P. Ross and A. E. Wishart.
22,378 Automatic mechanical control for trains disregarding signals—C. R. Shrewsbury.
22,386 Signalling and controlling locomotives—J. Partington.
22,397 Train control apparatus—C. H. Dent.
22,453 Outside seats for motor omnibuses—E. Zepler and T. H. Sutton.
22,535 Railway rails—J. R. Calder and O. D. Peat.
22,563 Signal for railways—A. Moore-Parsons and C. W. Codd
22,583 Generation of electrical power; the electro-mechanical propulsion of railway and tramway vehicles, etc.—W. P. Durtnall and A. H. Binyon.
22,609 Means for supporting tramway rails—J. Robbins
22,643 Safety controlling devices for railways—E. Browning.
22,660 Railway spikes or railway spiral chair-spike E. Butterfield (*P. F. Butterfield*).
22,701 Railroad ties and beds M. W. Tebyrica.
22,829 Signalling and controlling devices—D. A. Cooper.
22,846 Signalling apparatus—F. S. Bolam.
22,867 Signalling apparatus—R. Capstick, W. Dawson, and A. W. Whelon.
22,950 Device for stopping a passenger train that has passed a signal at danger—W. J. Owen and C. L. Mason.
22,951 Motor omnibuses—C. Mears.
23,197 Covering for outside seats of motor omnibuses—F. B Topfield.
23,205 Railway signalling—T. Evans, D. J. Evans, and S. Watkinson.
23,264 Life-guards for motor omnibuses—P. C. Sarapata.
23,428 Railway signalling apparatus—J. W. Milne.
23,478 Electrical signalling apparatus—G. Dearle.
23,520 Railway signalling apparatus—A. W. Fisher.
23,523 Guard for tramcars—K. Krienitz.
23,545 Means for preventing side-slipping of motor omnibuses—F. Anderson.
23,640 Electric signalling systems for railways—T. D. Parr.
23,671 Railway signalling apparatus—S. Falls.
23,672 Railway signalling apparatus—F J. Wellisch and F. Titterton.
23,673 Rail joint—J. B. Murphy.
23,674 Guard for tramcars, etc.—J. B. Murphy.
23,797 Device for signalling and braking railway trains—B. Williams.
23,801 Safety device for use with railway signals—A. Krall.
23,824 Railway signalling control—H. Lewis, L. A. Robinson, and G. A. Youngman.
23,869 Rail joints—A. W. R. Beaney.
23,876 Automatic brake appliances to prevent train equipped with vacuum brake from passing signal at danger—J. Jewell and J. Anderson.
23,877 Seats for tramcars—E. S. Rayner.
23,894 Automatic danger signal for railways—J. Bassett.
23,926 Life-guard for motor and tramway vehicles—J. R. Togna.
23,943 Chairs for rail joints—G. Turton, Platts and Company, Limited, and H. Liddell.
23,976 Automatic electrical signalling for railway trains—W. Hiley.
23,978 Safety railway appliances—C. Gregory and T. Gordon.
23,996 Devices for stopping railway trains—A. G. Garden.
24,005 Tram passenger register—E. Priestman.
24,030 Controlling and signalling apparatus for use on railways—J. J. Daniels.
24,062 Brakes for tramway and railway vehicles—E. Hatton.
24,067 Vacuum brake apparatus—E. S. Luard.
24,113 Trains—Oesterreichische Daimler Motoren Akt.-Ges., and H. Reik.
24,178 Railway signalling apparatus—G. Grey.
24,193 Signalling and interlocking for railways and tramways—McKenzie and Holland, Limited, and C. H. W. Edmonds.
24,208 Guard rail attachment for permanent ways—C. Pasel.
24,263 Automatic signalling apparatus for railways—G. Higginbotham.
24,275 Trolley pointer guide for electric tramcars—G. F. Wrench.
24,361 Railway sleepers—E. T. d'Cunha.
24,408 Brake apparatus—W. H. Rymer.
24,441 Electric signalling apparatus for railways—F. Mackintosh.
24,444 Train signalling systems—B. Starie.
24,511 Railway signalling apparatus—S. Wormald and W. Stead.

**PATENT WEATHER SCREEN FOR MOTOR 'BUSES.**
NO GLASS. Instantaneously opened and closed.
ADJUSTABLE TO ANY DRIVER. NO REFLECTED LIGHTS.
*As supplied to the Birmingham Corporation, Sheffield Corporation, and London & North Western Railway Co., etc., etc., etc.*
Particulars apply **T. C. AVELING & Co. (B'ham), Ltd.,**
*91, New Canal Street, BIRMINGHAM.*

J. H. Butcher & Co. TRANSFER PRINTERS. BIRMINGHAM.

AILSA OILSKINS with Padded Scyes and Protected Sleeves. Send for sample of our latest improved pattern. AILSA OILSKIN CO. *Manufacturers.* Dairy, near Glasgow.
FOR MOTORMEN.
*Extracts from Users' Letters:*
"Ailsa Coats are best and cheapest we have ever had."
"Motormen's Oilskins supplied by you gave every satisfaction."
"The oilskin coats we now use are entirely confined to the 'Ailsa' manufacture."
"We have tried several makes of Oilskins, but none have been equal to the 'Ailsa' make."
"Past results have been so satisfactory that we have this year decided to place the whole of our order in your hands."

24,940 Railway switches or points—L. W. Williams.

## Specifications Published.

1912.

21,087 Brakes—Mark (*Rotary Air Brake Company*).
24,740 Rail sleepers—Caron.
29,904 Spring check rails for railway vehicles—Williams, Williams, and Williams.
21,601 Apparatus for checking the fares of persons travelling by omnibuses, trams, etc.—Ottino.
21,710 Railway and road passenger vehicles—International P-A-Y-E Tramcar Company, Paul and Tanner.
25,194 Device for attachment to the wheels and axles of motor omnibuses, for preventing the splashing of mud and water—Cooper and Cooper.
21,488 Metal railway sleepers—Willis (*Newcomb*).
21,784 Seats for tram-cars, etc.—Brown.
22,139 Instrument for registering the profile of the head of a rail on tramway or railway tracks—Morris.
25,333 Railway signalling apparatus—Handcock, Dykes, and Duddell.
25,970 Apparatus for securing in place or removing the wearing portions of compound tram rails—Noll.
14,846 Means for automatically equalising the load on electric tramways or railways—Bergman.
17,476 Omnibuses—London General Omnibus Company, Rackham, O'Neill, Messervy, and Iden.
19,952 Brake blocks—Frood.
21,983 Power transmission and propulsion for self-propelled vehicles and locomotives—Marshall.
22,833 Electric signalling systems for railways—Ward.
23,639 Trolley poles for tramcars—McQuade.
24,522 Clips for anchoring electric trolley wires for tramways—Welsh.

1913.

6,185 Block-signalling and train-controlling systems—Allard.
8,266 Joints for railway rails—Ledoux.
14,012 Method for forming parallel faces on the ends of rails to be butt-welded—Th. Goldschmidt Akt.-Ges.
2,112 Compound rails for railways and tramways—Rhodes.
2,676 Rail joints—Buster.
4,047 Rail joints—Young.
9,030 Securing of railway rails to sleepers—Schisler.
9,475 Rail joints—Imray (*National Malleable Castings Company*).
11,353 Car couplers—Imray (*National Malleable Castings Company*).
16,076 Top-deck seating arrangements for motor omnibuses—Hickman.

### TRAMWAY DIRECTORIES.

A useful feature of this issue is the directory of electric railways and electric tramways which will be found among the advertising pages. This directory contains the names of the chief officials and the principal particulars relating to each undertaking.

The directory is revised as occasion requires, and is the most up-to-date and comprehensive list published.

The Royal Automobile Club have declined an invitation to appoint a representative to serve on the committee formed by the Incorporated Municipal Electrical Association for the purpose of considering and adopting such measures as may be found desirable to further the use of the electric battery vehicle. A similar invitation was extended to the Automobile Association and Motor Union, but so far we have not heard of the decision of the latter organisation. If the Royal Automobile Club's determination had been arrived at prior to the formation of the National Council of motor organisations, there would be ground for attributing it to an assumption that the Automobile Association and Motor Union had decided to identify themselves with the Electric Vehicle Committee. For some time after the severance of the Motor Union from the Royal Automobile Club the latter body refused all overtures to work in harmony, but when the Motor Union became amalgamated with the Automobile Association, which even prior to the fusion was the strongest motoring organisation in the United Kingdom, wiser counsels dominated the executive of the Royal Automobile Club. The object of the National Council is to influence legislation, and the title would have been a misnomer without the support of the Automobile Association and Motor Union. The Electric Vehicle Committee's movement is not likely to suffer from the absence of a representative of the Royal Automobile Club, and there is no need for the Incorporated Municipal Electrical Association to spend any time in alleging that the club's refusal constitutes a departure from its chief object, which is the encouragement and development of the motor movement. It is true that the membership is not restricted to petrol car owners; that the rules for certified trials of motor vehicles carried out by the club do not confine such trials to petrol vehicles; and that trials of other than petrol cars have been permitted. Still the committee of the Club would have averted much misunderstanding if, instead of publishing a bare announcement, they had given a reason for their refusal. Doubtless the real ground for standing aloof is to be found in the fact that the Club take no part in any propaganda connected with promoting the sale of any vehicles. A refusal based on this motive would be justifiable. Whether it would be so in the case of the Society of Motor Manufacturers and Traders if they had been invited to assist the committee is another matter; but apparently the manufacturers of storage batteries for vehicles in this country are so few in number that they have not yet become associated with that or any organisation.

---

As the electric vehicle industry progresses there should be scope not only for new private and commercial body makers, but for existing petrol chassis manufacturers to cater for the electric vehicle, apart from its batteries. In view of the action of the Society of Motor Manufacturers and Traders in voting a sum of one thousand pounds for the purpose of carrying out alternative fuel trials as the outcome of the Petrol Committee's deliberations, a good case might be made out for the society extending encouragement to the Electric Vehicle Committee. If only for the purpose of providing a substitute to liquid fuels, the work of the Electric Vehicle Committee is deserving of support, for, as Mr. J. S. Critchley remarked in his presidential address at the opening of the winter session of the Institution of Automobile Engineers, the price of petrol has now risen to so high a figure that it seriously handicaps the development of the commercial vehicle. There need be no antagonism between the petrol and electric vehicle, for both have spheres for which the characteristics of one is more fitted than those of the other. This has been discovered in the United States, where the battery car and truck have attained wide popularity. Considerable mischief, however, was occasioned until recently by various types being allotted work for which they were unsuitable, and much money has had to be expended in advertising to remedy the error. Agents in this country should be careful to avoid committing a similar mistake, for users are just beginning to take an interest in the electric vehicle, and unless they are rightly guided the movement may receive a set-back. There could not be a more influential circle of supporters than those who are at the back of the committee, whose chairman is Mr. R. A. Chattock, city electrical engineer of Birmingham, while Mr. F. Ayton, electrical engineer and tramways manager at Ipswich, is the honorary secretary. Both municipally and company-owned electric supply undertakings are uniting in support of the movement, and the scope of the committee's work has been defined on correct lines. As a first step, electric supply authorities are to be impressed with the financial advantages that will accrue to them if they take steps to encourage the use of the vehicle by supplying energy for charging purposes at a reasonable price, to induce hotel proprietors and motor car traders to provide charging facilities, and to impress upon municipal bodies and

Digitized by Google

# MOTOR TRAFFIC.

others the advantages attending the use of the electric vehicle. Many other items are included in the published outline of the committee's operations, but none are more important than those that stand second and third upon the list, viz., to decide upon the best arrangements to recommend for charging, and to consider the issue of rules for the proper use and maintenance of the vehicles.

---

Considering that it is a burning question in more senses than one, disappointment may be expressed that little or nothing has been done towards carrying out the decision of the Petrol Committee to form a sub-committee for the purpose of testing alternative fuels. A year has elapsed since the matter was referred to the Royal Automobile Club, and the delay would seem to afford ground for the belief that that institution excels in the rôle of the biggest social club in London rather than in the scientific side of motoring. Fortunately another body has come to the rescue in the shape of the Alcohol Fuel Committee, formed as the outcome of the Imperial Motor Transport Conference. That committee will conduct investigations covering the Dominions, the Colonies, and the British Isles, and will also conduct experiments. This announcement has been made by the Hon. Arthur Stanley, M.P., in reply to Mr. Critchley's remarks to the Institution of Automobile Engineers, viz., that the importance of the subject demands the carrying out of complete investigations. In the 40 printed pages comprising his paper, Mr. Critchley fully reviews what has been accomplished as regards alternative fuels in this and other countries, and he justly gives credit to the Motor Union for having first taken up the question in 1906. Then, as now, alcohol was the substitute to which attention was chiefly directed. At the time the recommendations of the Union for the organisation of a competition to decide the merits of alcohol and petrol, and for the selection of the best paraffin carburettors and vaporisers, were apparently shelved by the Royal Automobile Club in a spirit of jealousy. Since then motorists have been indebted to individual effort for what progress has been made in finding substitutes to petrol. While information is being collected as to the resources of the various portions of the Empire in the provision of alcohol from vegetation, no time should be lost before carrying out experiments in the use of that spirit in the propulsion of the several classes of motor vehicle. What is required are immediate researches into the question of the cost of the home product. It is maintained by some authorities that the cost of manufacture in the Colonies would range from fourpence to sixpence per gallon and even less from peat.

---

No modern movement affecting both private and public interests has attained a greater degree of publicity than that of public passenger transport by road motor vehicles. In London, for instance, the discussion which has attended its development has probably been greater than was the case when railways displaced the stage coach, for the reason that while only the well-to-do could afford to travel behind a four-in-hand the motor omnibuses, carrying people on pleasure and business trips 20 miles beyond the London boundary, do so in return for a rate of payment which is practically only nominal when compared with the cost of hiring a motor car. Then again the public vehicle, like the car of the private owner until three or four years ago, has to face a storm of discussion anent dust raising and road maintenance. Tar spraying and improved methods of road construction deprived the rural reporter of a small source of income from daily newspapers, but the ratepayers have benefited by reason of the longer wear now given by road surfaces. While the omnibus is passing through the throes of a similar turmoil, the bill of costs presented to the ratepayers for road maintenance is not viewed with favour, but when the transition stage has passed the various main roads will have surfaces of greater strength and of a practically dustless nature, even when wood paving is not utilised. As the new work will be paid for partly by grants from the Road Board and partly by loan, the call upon the ratepayers should not in reality be greater, for the payment is spread over a longer period. The recent agitation on the part of the local authorities of Greater London had a beneficial effect in awakening the Road Board to the needs of the metropolis, and the various Councils should not lose sight of the fact that the Board have been hoarding up a great balance for the expressed purpose of providing work for the unemployed during the winter seasons.

---

Hitherto no call has been made on that reserve fund for that purpose, but the indications are that the coming winter will provide the need, apart from the necessity of pushing forward road reconstruction at a faster rate than is now being achieved. The circumstance that the Board and their advisers shared out just under £20,000 in salaries and fees up to May last shows that they are sufficiently well paid to put a little more dispatch into their labours. Probably the future will bring an improvement in this respect, for Mr. H. P. Maybury, the Kent county surveyor, has just been appointed chief engineer to the Board. Mr. Maybury's work in that county during the last nine years of motor traffic has stamped him as the leading road engineer in this country, and it is a matter for regret that he did not enter upon his duties from the position of an advisory engineer until November. The Board has been further strengthened by the appointment of Mr. A. Dryland, county surveyor of Surrey, and Mr. E. P. Hooley, county surveyor of Nottinghamshire, to the Engineering Advisory Committee. After this refitting the Board should be left to pursue the important part which the members have to play in the annals of British road construction, especially as regards laboratory work and the use of trial lengths of various materials. The latter sphere of activity constituted one of the most valuable exhibits brought to the notice of the delegates who attended the recent International Roads Congress and the Imperial Motor Transport Conference. Undoubtedly the Road Board is an improvement on the ordinary Government department, and although some day the organisation may give place to a Central Roads Board the record of the parent body promises to be a most useful one. The members can afford to view with complacency the demand made by the Automobile Association for the Executive Committee of the latter to inquire into the policy of the Board and the manner in which the funds are being administered.

## THE UPKEEP OF MOTOR VEHICLES.

By C. M. Linley.

Few owners of motor vehicles realise the enormous sums that are wasted through ignorance and carelessness. If I were to say that 75 per cent. of the money spent annually on upkeep is spent unnecessarily, I should be quite safe. It is interesting to watch the despatching of replacement parts from a factory where commercial motors are manufactured. If these parts are examined, it will be seen that a very large proportion of them should never be required had reasonable attention been given to the original part. It is also interesting to watch the records of various users of commercial motors and compare their different expenditure on the same class of vehicles.

I have some figures before me which will show how money can be wasted on upkeep through neglect. Here are two firms using the same make and type of van. A has spent £150 in 16 months, and the car is returned now to the makers for a thorough overhaul. B has had his car two years and six months, and has run 36,000 miles. Apart from tyres his repair cost can be judged from his own words. He says in a letter of August 26, 1913:

> "You will remember I had my car new on Good Friday, 1911, and until about three weeks ago I had not even taken the cylinders down for cleaning, and then I found the only renewal necessary was one big end bearing. The gear box has not been touched, and, in fact, I have not been put to any expense for repairs. As for renewals, I have had one set of tyres, two pairs of shoes for foot brake, one pair of chains, one valve. I attribute this to careful, conscientious, sane driving, and periodical inspection and adjustment. The car has done something like 36,000 miles over various roads."

Neither of these instances are exceptional, and I could fill a whole page of such comparisons. There is no reason to believe that one owner had a better car than the other in the first place, nor is there any reason to believe that one car had a harder duty to perform than the other. An inspection of the two cars made it easy to find the reason for A's large expenditure. The car showed signs of neglect in every detail. Lubricators were missing from many parts. The glass window for observing the flow of oil to the engine was so dirty that it was impossible to tell whether there was any oil in the engine or not. The neglect of this precautionary device had been responsible for all four of the big ends giving out several times. Bolts were missing from a great many parts, and often, where two or more bolts were provided for, only one was in place. Many nuts were only finger tight, allowing movement to take place between parts that should be fixed tightly together. Altogether the machine showed that as long as it would run, nothing was done to it. On the other hand, B's car showed that it was properly looked after. I don't mean that the brass work was highly polished, as this can easily be mistaken for attention. In B's case every lubricator was in its place, and, what is more, they had oil in them. Every nut and bolt was in its place and tight. In all probability A thought that time spent in oiling and adjustment was money wasted, and that he was in pocket by not having it done.

It is difficult to make some owners realise the importance of the stitch in time policy. A stitch in time in commercial vehicles not only saves nine, it sometimes saves nine hundred and ninety-nine. I came upon a typical instance of how the neglect of a small detail may lead to a very heavy expenditure.

A driving chain was allowed to get so loose that it jumped off the sprocket, and in doing so knocked a lubricator off the bearing of the sprocket shaft. The driver did not report this, and the lubricator was not replaced. The driver tried to push grease in with a stick and was quite satisfied with this. Needless to say the grease did not get there, the ball bearing was short of lubrication and seized up, the shaft began to carry the bearing round with it, so that it wore its housing away, and the bearing then got loose on the sprocket shaft and cut a deep groove in the shaft. The wear in the bracket and shaft caused the latter to get out of line with the differential. This caused serious damage to the differential, and the cost of the job, including time and parts renewed, was £40. An expenditure of 15s. would have saved this. There are many causes of neglect; mostly it is caused through the drivers not having sufficient time allowed to go carefully round, greasing and tightening up.

In the majority of cases I have found the drivers willing to take an intelligent interest in their cars if they get the time and have a properly equipped place to do it in. In cases where a number of vehicles are under one roof it is possible to have a proper system of inspection and maintenance. If the lubrication and adjustment is taken out of the drivers' hands, care should be taken that the person to whom it is entrusted is competent, and has sufficient time to do it thoroughly. Strange to say, some of the worst cases I have ever met of neglect have been in vehicles owned by railway and tramway companies.

The motor 'bus is in some cases the cinderella of the tramcar depot. A certain Corporation I have in my mind at one time had 12 tramcars and 9 omnibuses. The cars are in a properly built shed where there is every convenience for their maintenance. Spares of all parts are kept, and all is in proper order. The 'buses are kept in an old cow shed with half the tiles missing from the roof. The floor is earth, and by the time nine 'buses have been washed it is not the best of places in which to do adjustments that require a man to go underneath the chassis.

The equipment consists of one small bench fitted with one old leg vice, without any cut on the jaws, which have been badly strained at some time so that they gape. There were a few old files and other tools lying on the bench, not in a drawer. A man is expected to do all repairs, including engine overhauls, in this place; badly lighted and not warmed. I need hardly say that this Corporation have endless trouble, and that their maintenance costs are enormous. In a properly constructed chassis there should be no very frequent renewals necessary. If they are frequently needed there is something wrong. It may be caused through neglect, or it may be through careless and furious driving.

Having given a typical instance of the cost of cars to different owners, I will now give an instance of how the actual driving on the road, quite apart from any system employed in the maintenance, can affect the upkeep.

Digitized by Google

# MOTOR TRAFFIC.

A certain firm of bookbinders have a 3-ton van; it takes a load of books to London every day, and a load of paper back at night, a total distance of 90 miles per day. The van is the property of the firm who made it, and is let to the bookbinding firm.

Once a week it goes to the factory where it was made for all adjustments and renewals. This is included in the contract. The car has been running in this way for four years. During the first two years the cost of upkeep was enormous. Every week some important and expensive part had to be renewed. Often the van had to come in during the week, and sometimes the weekly allowance of time was not enough, and the van had to be kept in for a day or so instead of the half-day as arranged. The driver seemed to be a good, conscientious man, and the trouble was attributed to the roads, or the load, or something that could not be altered. It was, however, always a puzzle to the engineer who had charge of the matter. One day the driver was changed. Like magic the trouble disappeared, and although the van is older and should require more attention, weeks and months and years go by with nothing requiring doing except the ordinary lubrication and adjustments. The journey is the same, the load is the same, everything is the same but the driver.

This again is not a unique case, although it is a very striking one. The speed at which a car is driven has, of course, a lot to do with the cost, but it is not speed alone. High speeds may be indulged in on a good road without much harm. It is speed over bad roads and turning corners fast that does the damage. It is wonderful how a little nursing will prolong the life of every part. The solid tyres used on commercial vehicles do not absorb road shocks to any great extent, and it is therefore much more important that they should be handled with a little reason when roads are bumpy.

## B TYPE CHASSIS FOR THE LONDON ASYLUMS BOARD.

The single-deck omnibus illustrated below is mounted upon a chassis of the well-known B type, which has had such a remarkable record in the service of the London General Omnibus Company. The vehicle, which is stationed at the head ambulance depôt, Fulham, has a seating capacity of 16 passengers, and, as will be seen by the illustration, has the neat appearance associated with the Board's vehicles.

The chassis is of the L.G.O.C. standard type, of which the following is a brief description: Length over all, 19 ft. 2½ in.; width over all, 6 ft. 8¾ in.; wheel base, 12 ft. 10⅜ in.; wheel track, 5 ft. 8 in. The engine is of the 4-cylinder type, with the cylinders cast in pairs, 110 by 140 millimetres, developing about 30 H.P. at 750 revolutions, the valves being arranged on opposite sides. Lubrication is by means of a gear pump to the troughs beneath the big ends. The "Solex" carburettor is fitted, and Bosch high-tension magneto.

B Type Chassis for a London Ambulance.

The cooling arrangements are on the thermo-syphon system, large diameter water pipes being connected with a plain tubular radiator with large cooling surface, and a belt-driven fan working immediately behind it. The clutch is of the leather-faced cone type of simple design, and easily removed or adjusted. The three-speed chain-driven gear box gives speeds of 3·84, 6·65, and 11·98 miles per hour at 750 revolutions of the engine, and a reverse of 3·91 miles per hour.

Digitized by Google

# MOTOR TRAFFIC.

The worm-driven back axle, with bevel differential, is so arranged that the complete gear is supported from the top cover of the axle, and is, therefore, capable of being entirely disconnected without removing the road wheels. The two separate brakes are both of the internal expanding type, operated by hand and foot on separate drums on the rear road wheels; a compensating device prevents any braking strains being transmitted through the driving gear.

Solid oak is the material used as the frame of the chassis, with nickel steel flitch plates, and it is of great durability. The cross members are of the same construction, except those for the engine, which are of pressed steel. Both the engine and the gear box are supported direct from the cross members. The cast steel wheels are fitted with Wood-Milne rubber tyres, 900 by 120 millimetres on the front, and 1,000 by 100 millimetres twin on the back. The complete chassis with tyres was supplied by Mr. Stewart A. Curzon, of Victoria Street, Westminster, the body being fitted by the Board's own engineers.

## OMNIBUS COMPETITION AT CAMBRIDGE.

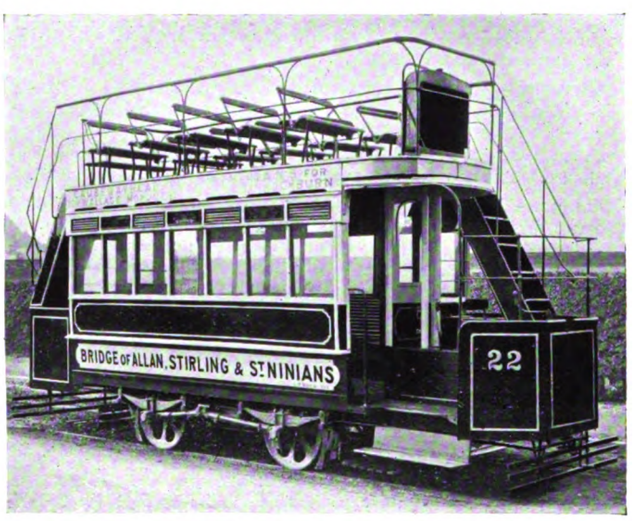
Mr. C. Armstrong, chairman of the Cambridge Street Tramways Company, stated at a meeting of the shareholders on October 21, that the Corporation, having obtained judgment for the amount owing by the company for repairs to the track, were now proposing to apply to the courts for an order to wind up the company. If they forced the company into liquidation they would receive no further contribution, and if they allowed the motor 'bus company to exercise a monopoly the costs of repairs to the roads would be largely increased with no advantage. If the company were met in a reasonable way as regards the upkeep, and the cost of forage was reduced, they could keep the tramways going in spite of the motor 'bus competition. He did not know whether it was too late for the Corporation to consider the suggestion that they should protect the company's routes, and meet the company as regarded the cost of upkeep. Certainly the motor 'bus service was a great acquisition to the town, but the vehicles were responsible for great wear of the roads. The 'bus company paid nothing to the town except for hackney carriage licences. The tramways company had offered to introduce a motor 'bus if the Council would assist them, but the committee did not feel inclined to pledge themselves.

## POST OFFICE MOTOR CONTRACTS.

In their report for the year ended June 30 last, the directors of McNamara and Company state that the accounts show the disastrous change which has come over the fortunes of the company since the commencement of the new Post Office contract for the London mail service. The directors were asked by the Post Office in July, 1911, to tender for a new contract for five years on the basis that about two-thirds of the mileage work be run by motors. In July, 1912, the Post Office motor service was commenced on the new lines, and it was only then that it was possible to realise the onerous conditions of the contract and the impossibility of carrying the service satisfactorily at the prices allowed by the Department. The contract had many exceptional features, which became apparent as time went on, and which distinguished it from other motor mail services, and very largely conduced to the serious loss incurred by the company during the last 12 months. Towards the end of June and July, 1913, it became apparent that it would only be a question of time before the company would be bled to death. Mr. Maxwell Hicks was later appointed the receiver and manager, and subject to the approval of the court, he had entered into a fresh arrangement with the Post Office for the carrying of the London mails previously carried by the company, which arrangement he considered satisfactory for the time being. Should this new contract be continued for a reasonably long period or a modification of the same be entered into by the receiver in December, 1913, the directors hope that they may then be in a position to consider the question of reconstruction of the company. The directors propose to defer calling the usual general meeting of shareholders until the receiver and manager is in a position to inform the board of the prospects of satisfying the debenture holders of the company.

## PETROL CAR FOR BRIDGE OF ALLAN TRAMWAY.

The line of tramway which connects Stirling with Bridge of Allan enjoys the distinction, if such it be, of being the only tramway in Scotland still worked by horses. It is really an interurban line, some three miles in length, and the traffic, except during the summer months, is not heavy. Attempts have been made from time to time to have some improved system of traction installed, but from lack of capital, or from want of a satisfactory arrangement with the local authorities concerned, or other cause, nothing has been done. Meanwhile an interesting experiment has been begun, under which the petrol-driven tramcar comes forward against the motor omnibuses. It is on lines of this sort, where the traffic is light, that the petrol car has a chance of showing what it can do. The line of the Morecambe Tramway Company is an existing case in point.



**Petrol Car for Stirling and Bridge of Allan Tramway.**

The accompanying illustration shows a petrol car which has been designed and constructed by the Lanarkshire Motor Company for the Stirling and Bridge of Allan Tramway Company. In general appearance it does not differ much from a standard four-wheeled car. The engine is a four-cylinder petrol motor developing 25-35 H.P. The shaft works through a three-speed gear box, and the final drive is by chains from a bevel cross shaft to each axle. Axle boxes of the sliding type have not been fitted, as the radius rods can give chain adjustment which cannot be got with the ordinary type of horn blocks. The engine is controlled from either end of the car. The radiator is placed over the canopy at one end of the car. The seating capacity of the car is for 20 passengers inside and 24 on the upper deck.

Major Pringle, of the Board of Trade, inspected the car on October 29, and passed it, subject to one or two slight modifications with respect to life-guards, and the protection of passengers on the upper deck.

ORDERS FOR ELECTRICAL VEHICLES.—Edison Accumulators will deliver early in November an electric tower wagon to the Ilford Council tramways department. It will be placed upon a 1-ton chassis, complete with 60 A 4 cells, having a mileage of 40 miles. At night it will have a lighting equipment of approximately six clusters of three 50 c.p. lamps, and it is furthermore proposed to install a drilling machine for rail drilling. This, it is said, is an advantage which no other type of vehicle at present possesses. Messrs. Libertys have given an order to Edison Accumulators for two more electric vehicles similar to the one they have already in use, namely, ½-ton carrying capacity, complete with 60 cells A 4, 150 ampere-hour, having a mileage of approximately 50 to 55 miles. The mileage of this car per week so far has averaged between 200 and 300 miles, and the total running cost, not including driver, has averaged under 10s. per week. Messrs. Pullers, Limited, have placed an order for a 1-ton van, complete with 60 cells A 6, mileage 50 to 55 miles. This is to be put into extensive trial with a view to their starting a fleet of electric vehicles. Messrs. J. Lyons have also ordered a 2-ton van to carry the equivalent of a double load of their existing pair-horse vans. A 2-ton van with a two-motor direct drive on the back wheels has been purchased by the Stratford Co-operative Society.

# MOTOR TRAFFIC.

## MUNICIPAL AND COMPANY OMNIBUS PROPOSALS.

CLECKHEATON.—A recommendation is to be submitted to the Council by the Law and Parliamentary Committee is favour of powers being obtained to run motor omnibuses between Cleckheaton and Scholes and Oakenshaw, with extensions later to other parts of the district. The local traction company are credited with the intention of starting a service in the district immediately.

COVENTRY.—The Maudslay Motor Company, Coventry, have been awarded a contract by the Corporation for the supply of six 40-H.P. omnibuses, at £739 each.

CREWE.—The proposal of the Corporation to obtain Parliamentary powers to run motor omnibuses has been rescinded at a special meeting by 25 votes to 8, the question being referred back to the committee for further consideration. This will involve a delay of 12 months in the application to Parliament.

DEWSBURY.—Yorkshire (Woollen District) Tramways Company have ordered three motor omnibuses, to be run experimentally from Dewsbury Market Place to Dewsbury Moor, from Dewsbury Market Place to Shawcross, and between Shepley Bridge, Bradley, and Brighouse. The new services are expected to begin in November.

DUNDEE.—The tramways manager has been directed to obtain estimates for a motor omnibus, which is proposed to be used on the Esplanade during the summer months in order to cope with the overcrowding of tramcars. The vehicle, it is suggested, could also be used to supplement the car service on special routes. Mr. Peter Fisher has stated that he hopes by an alteration of the system of reliefs to do something to lessen the overcrowding difficulty. In regard to a suggestion for adopting the queue system, he states that the police refuse to recognise it.

EDINBURGH.—A conference was held between the Tramways Committee and the Tramways Company for the consideration of routes for the experimental running of motor omnibuses by the company, the vehicles to be purchased by the City Council.

LANCASTER.—Parliamentary powers are to be applied for by the Council for running motor omnibuses within the borough.

LINCOLN.—Councillor Ashley informed the Council at their October meeting that in the matter of running motor omnibuses the Electricity Works Committee had had an application from the British Automobile Traction Company, and that they had come to an agreement with them, but for some reason the company declined to sign the agreement. The Provincial Tramways Company had also applied, but they had offered such conditions that the committee knew the Council would not assent. The committee now proposed to bring facts and figures before the Council in committee and discuss the whole problem.

LIVERPOOL. -Proposals are under consideration by the Tramways Committee for purchasing additional omnibuses in order to extend the services to districts not at present provided with means of locomotion. The type of vehicle in use by the Sheffield Tramways Committee has been inspected at Liverpool and tested on a route which included the Erskine Street hill. Other types of vehicle are also to be inspected.

MANCHESTER.—The Tramways Committee intend to seek powers to run omnibuses along roads outside the city where tramways are either owned or leased by the Corporation, or over which they have running powers

NEWCASTLE-ON-TYNE.—On October 20 the Corporation adopted a recommendation by the Tramways Committee to apply for powers to extend the tramways to Longbenton, outside the city, and to run motor omnibuses in the Longbenton Council's area, which has a population of 16,000. Councillor Rodgers mentioned that the Benton boundary tramway extension increased the receipts by £80 a week, and the Elswick extension to Chillingham Road increased the receipts from £280 to £555 per week. The motor 'buses to Westerhope now carried the population of the village two and a half times a week. So far as Lemington was concerned, they were carrying over 12,000 a week—the population three times over. The Westerhope 'buses were paying, and, moreover, they were feeding the cars to the tune of £20 a week.

NEWPORT.—The Tramways Committee have decided to recommend the Council to apply for powers to run motor omnibuses on nine routes. This decision was arrived at after consideration of a report on additional means of transport in the borough and adjacent districts by Messrs. N. J. Young, general manager of the electricity and tramways department, and A. Nicholls Moore, the electrical engineer. A company has obtained Parliamentary powers for running a system of railless cars in an adjacent area, and Messrs. Young and Moore suggested that the Corporation should maintain the monopoly they now enjoy within their own boundaries, and also advised extension. They pointed out that the motor 'bus had so far found most favour for such work.

READING.—Approval has been given by the Council to recommendations by the Tramways Committee for the promotion of a bill to empower the authority to extend the tramways and to establish railless trolley and motor omnibus services.

TRAFFORD PARK.—At the annual meeting of the Trafford Park Estates Company, near Manchester, a shareholder suggested that motor 'buses should be run in the park. Motor 'buses were running tramcars "off their legs" all over the country. The chairman (Mr. Stevens) said the company had not overlooked this possibility, and hoped in the future to see them when the roads were completed. The company could not be expected to put any capital into them, however. At an earlier stage of the meeting the chairman, in directing attention to the company's investments, said the greatest amongst them was the statutory company owning their railways. They were now earning 3½ per cent. from these railways, but they could never receive a considerable dividend, because it was the essence of their policy that the company did not charge terminals or switching charges, but only the net port railway rates at Manchester Docks, which included a sufficient toll to cover the working expenditure and interest upon the capital.

WARRINGTON.—Consideration is being given by the Tramways Committee to a suggestion made by the Winwick Asylum authorities for the running of a motor omnibus service to Winwick.

WEST BRIDGFORD.—Five omnibuses are to be purchased at a cost of £3,950 by the Urban District Council, the chassis being of Dennis manufacture and the bodies of the Allen type, which was illustrated in THE TRAMWAY AND RAILWAY WORLD of July 10 last. The garage is to cost £1,589, and the service is expected to be inaugurated before Christmas.

WREXHAM.—In order to meet the needs of the district between Chester and Mold the Wrexham and District Electric Tramways Company have decided to run a motor omnibus service.

## "PROVINCIAL GENERAL OMNIBUS COMPANY OF ALL ENGLAND."

SEQUEL TO AN INTERESTING PROJECT.

An action was brought on October 20 in the City of London Court by Mr. C. Chadwell, engineer, of Blackburn, against the General Rapid Transit, Limited, 4, Broad Street Place, E.C., for £38 10s. 5d for professional services rendered. Defendants counterclaimed for £20, money said to have been lent to plaintiff.

For plaintiff it was stated that some years ago he was associated with light railways and tramways in Lancashire with one Lawson. In June last Lawson told plaintiff he was interested in the defendant company, which was bringing out the "Provincial General Omnibus Company of All England, Limited," the object being to establish a motor-omnibus service between various towns in Lancashire and the provinces generally. Lawson thought plaintiff might be of use in obtaining consents of various local authorities in Lancashire, and he was introduced to Mr. Robertson, the managing director, who agreed to give plaintiff £5 a week and out-of-pocket and travelling expenses, and it was suggested that plaintiff should have £1,000 or a position of trust in the company if he obtained the various consents that were wanted. That, however, did not now arise. Plaintiff was asked if he could introduce capital, and Robertson agreed to give him 10 per cent. commission on his introductions. None were effected. Plaintiff was paid £5 per week for four weeks, and he called on various local councils; but defendants did not go on with the scheme, and plaintiff now claimed to be paid for several weeks' work done for defendants.

Mr. Robertson, defendants' managing director, gave evidence that plaintiff promised to introduce capital, and to get consents from local boards to the running of omnibuses in various parts of Lancashire, but he had done nothing but "bluff."

Judge Lumley Smith, K.C., thought that the plaintiff had been paid enough. It was a voluntary payment. He gave judgment for defendants on the claim and counter-claim, with costs.

OLYMPIA MOTOR CAR EXHIBITION.—The annual show of private motor cars was opened at Olympia on November 7, and it will remain open until the 15th inst.

# MOTOR TRAFFIC.

## DAIMLER ALLIANCE WITH THE L.G.O. WORKS.

Sir Hallewell Rogers, in moving the adoption of the report presented to the Birmingham Small Arms Company at the annual meeting held on October 8, mentioned that the Daimler Company during the past year made a net profit, amounting in round figures to £128,000, on an investment which stood in the balance sheet at only £351,000. This might be regarded as very satisfactory, and he might state that the aggregate profits of the Daimler Company for the four years during which they had owned that company had been upwards of £430,000. The extensions of the works which were now needed were the result of the adoption of a very progressive programme in the development of commercial vehicles and chassis for omnibuses. They had concluded an arrangement which, while enabling this part of the business still to progress, was not likely to make for some years to come any further demands upon the capital resources of the company. The arrangement in question was a working alliance between the Daimler Campany and the manufacturing undertaking connected with the London General Omnibus Company, known as the Associated Equipment Company, whereby omnibuses and certain sizes of commercial vehicles, for which there was a large demand, would be made at the factory of that company. The factory was, perhaps, the most modern one which had been constructed, enabling any possible demands for that particular vehicle which they could foresee to be adequately and quickly met by that company for them. Incidently another advantage accrued to the company from this alliance in removing from the field of competition an undertaking which would otherwise undoubtedly secure a large proportion of the orders going, having regard to its great and unique experience in the manufacture and operation of this class of vehicle. The London General Omnibus Company were operating a large number of omnibuses manufactured by the Daimler Company, and as a result of their experience with these vehicles had placed an order for a considerable number of Daimler sleeve valve engines for use with the General Omnibus Company's fleet. A satisfactory feature of this arrangement was that it enabled the Daimler Company to devote the resources of the existing works to the manufacture of types of commercial vehicles other than those to be made at the Associated Equipment Company's works, and at the same time enabling them to share in the profits.

Mr. E. Manville, in seconding the motion, emphasised the advantage of the arrangement which had been come to with regard to the acquisition of the output of another large factory, saving them, as he hoped, further expenditure on the Daimler side for many years.

The following dividends were agreed to: On the preference shares at the rate of 2½ per cent., less income tax, amounting to £4,782 9s. 9d.; on the ordinary shares at the rate of 5 per cent., together with a bonus of 1s. per share, free of income tax, amounting to £76,698 4s. The sum of £10,000 is carried to the general reserve fund and £50,000 to machinery reserve fund.

## INSTITUTION OF AUTOMOBILE ENGINEERS.

The second meeting of the session of the Institution of Automobile Engineers was held on Wednesday, November 12, in the Hall of the Institution of Mechanical Engineers, Storey's Gate, St. James Park, S.W., when Dr. W. R. Ormandy read a paper entitled "Some Experiments with Mixed Fuels with Special Reference to Alcohol Mixtures."

The Institution has published the presidental address given by Mr. J. S. Critchley on October 8, in which the fuel question is dealt with. The secretary has also issued the paper on "Elements of High-Speed Automobile Engine Design," read by Mr. L. H. Pomeroy at a meeting of the North of England branch.

### Training of the Automobile Engineer.

Mr. J. S. Critchley in the course of his presidential address to the Institution of Automobile Engineers in London, said: The subject of the training of the automobile engineer came up for discussion last session. He proposed to devote himself heartily during his year of office to the desirable object of putting the suggestions then advanced into some more definite form, so that the Institution might be in a position to help those who were desirous of having their sons educated in such a way that they might eventually be fitted to occupy seats on the Council of the Institution.

Walsall.—It is proposed by the General Purposes Committee that steps be taken to promote a bill both for extending the tramways by means of trolley vehicles and also motor omnibuses.

## ABSORPTION OF NEW CENTRAL OMNIBUS.

Mr. John O'Connor, M.P., presided at a meeting of the shareholders of the New Central Omnibus Company, held on October 22, when a resolution was unanimously passed approving of an agreement by which the Underground Electric Railways Company of London, Limited, will acquire outright the New Central Omnibus business, instead of continuing the present working arrangement. The agreement provides that the New Central Company will receive £194,000 of 6 per cent. income bonds of 1933 and 48,500 A ordinary shares of 1s. each of the Underground Company, and a sum in cash which will enable the New Central Company, after providing for all prior charges, to pay a dividend at the rate of 8 per cent. per annum for the nine months ended June 30, 1913, from which date the interest and dividends on the new Underground bonds and shares will accrue. As the issued capital of the New Central Company is £96,689 in £1 shares, the purchase consideration provides a little more than £2 of Underground bonds and half a one-shilling A share for each New Central share. At the present prices of the Underground securities this is equivalent to a cash value of about £2 os. 6d. for each New Central share.

In moving the resolution, the chairman said the company were restricted to the running of 100 vehicles under the existing agreement, and the policy of the London General Omnibus Company of pursuing a course which would serve the public to the best advantage by increasing the number of omnibuses must inevitably reduce the unit-earning capacity of each 'bus run. This being so, the New Central Company could not hope in the future to receive the net profits on the same basis as earned in previous years. As the result of interviews extending over some months the new agreement had been evolved, and this would overcome the difficulty, and secure for the shareholders an immediate income upon a newer and broader basis. The scheme also provided for a payment for three years of the directors' present salary, and in return they consented to be bound down from directly or indirectly carrying on or being interested in the business of proprietors or manufacturers of motor omnibuses within a radius of 30 miles of Charing Cross or 10 miles from the town of Bedford. He thought the shareholders, instead of receiving the former minimum dividend of 8 per cent., could look forward to at least 12 per cent. per annum, and they would still have an interest in the prosperity of the London General and Underground group of railways in the possession of 48,500 A shares.

## PETROL-ELECTRIC FIRE APPLIANCES.

At a meeting of London County Council, on October 21, the Fire Brigade Committee presented a report recommending new arrangements for obtaining certain petrol-electric appliances. The proposals were that expenditure on capital account up to £3,265 for the purchase of two petrol-electric turntable ladders be sanctioned; that acceptance of an offer by Magirus, Ewald, and Lieb, of Ulm, to supply two Magirus ladders for £1,200 be approved; and that acceptance of an offer amounting to £2,200 of Cedes Electric Traction, Limited, for the supply of two petrol electric chassis for fitting to Magirus ladders and the fitting thereof be approved. It was also recommended that expenditure on capital account of £975 for obtaining a petrol-electric escape van be sanctioned; that the acceptance of an offer amounting to £890 of Cedes Electric Traction, Limited, for the supply of a petrol-electric chassis for an escape van be approved; and that the work of completing the escape van be carried out at a cost not exceeding £150 by direct employment of labour under the direction of the Fire Brigade Committee. The committee further proposed that motor cars should be obtained for the use of the two divisional officers of the Fire Brigade. Under existing arrangements these officers were provided with horse-drawn carriages. Motor cars had already been provided for the assistant divisional officers and for the superintendents. An offer to supply at £250 each the chassis (without tyres) for the two cars required had been received from the Wolseley Tool and Motor Car Company, which supplied the chassis for the superintendents' cars. The estimated cost of each car was £450, and it was proposed to arrange for the supply of the bodies and the purchase of the tyres and accessories separately. The proposals were adopted

Edison Accumulators, Limited.—The board of this company now comprises Lord Montagu, Colonel H. C. L. Holden, Messrs. B. M. Drake, A. L. Pearce, and J. F. Monnot (managing director). The company has taken new offices in Duke Street, W.

# MOTOR TRAFFIC.

## MOTOR TRAFFIC NOTES.

MOTOR VEHICLES REQUIRED IN ASSAM.—The tea and rice planters of Assam are showing great interest in the improvement of communication. A great impetus has lately been given to trade.

ELECTRIC OMNIBUSES FOR BERLIN.—It is announced that two lines of electric omnibuses are about to be established in Berlin. The vehicles will, like the electric cabs, carry their power in accumulators.

NEEDS OF WEST BROMWICH.—The Highways Committee of the Corporation are considering a report from the borough surveyor on the question of the railless trolley car and the motor omnibus.

MUD-GUARDS FOR OMNIBUSES.—Messrs. Tilling, Limited, have adopted for their motor omnibuses running in the metropolitan area a mud-guard reported to be arranged in such a way that it is not damaged when it collides with the kerb or other obstacles.

AVON MOTOR TYRES.—The Avon India Rubber Company, Limited, Melksham, Wiltshire, have issued well-printed brochures giving the prices of the wide range of commodities manufactured at their works, and describing the manner in which Avon motor tyres are made. The solid tyre department includes the band and clinched-on types.

A LEEDS SUBURBAN SERVICE.—On October 30 the Leeds tramways department started a motor omnibus service between Moortown and Shadwell, in compliance with the promise made by the Corporation to the new ward before it came within the city boundary. The petrol-electric omnibus was supplied by W. A. Stevens, Limited, of London.

CARRIERS ACQUIRING RAILWAY TRAFFIC.—A deputation of the Newcastle and Gateshead Chamber of Commerce on October 13 informed the manager of the North Eastern Railway that owing to railway delays traders were being compelled to send a large amount of outward traffic by carriers, and that goods were being brought from London by steamer as far as possible.

"SOUTHERN" MOTOR OMNIBUSES.—Since the amalgamation of the South Metropolitan Tramways Company with the London Traffic Combine the company, whose tramways serve the district between Croydon, Crystal Palace, Sutton, and Tooting, have placed a number of motor omnibuses in service between the Crystal Palace and the Albany Street Barracks in north-west London, and on other routes.

HEAVY MOTOR CARS AND TRAILERS.—The Commercial Motor Users' Association have agreed to oppose the application which the London County Council have decided to make to the Local Government Board to issue regulations under the Motor Car Acts, 1896 and 1903, to require that every "heavy motor car" with a trailer shall have a guard at the rear of the trailer who shall warn the driver by means of a communication cord, or otherwise, of the approach of overtaking traffic.

NEED FOR PUBLIC SERVICE VEHICLES AT FOLKESTONE.—Remark was made at the October meeting of Folkestone Chamber of Commerce by the chairman, that that body would have to take in hand the question of a 'bus service. Folkestone had not a service, but Hythe and Cheriton had. A town of 35,000 inhabitants ought to have a thoroughly good tramway or motor 'bus service. The tramway scheme had been blocked and stopped. What were they going to give the town in place of it? Everything suffered in the town through lack of transit.

ROAD MOTORS FOR THE OPENING UP OF CHINA.—In lecturing at York on "Railway Development in China," Mr. P. Burtt, passenger manager of the North Eastern Railway, who four years ago made a tour in that country, stated that when the present troubles settle down the demand for foreign goods would begin. As an instance, the Governor of Szechuen had recently sent to London to ascertain the cost of road motors. His idea was that if he built and levelled roadways now he could soon turn them into railways when he obtained the money with which to finance railways.

LECTURES TO MOTOR DRIVERS.—The first of the series of "steam" lectures to drivers in the employ of members of the Commercial Motor Users' Association was delivered on October 22, to over 100 drivers, at the Royal Automobile Club, by Mr. G. W. Watson, inspecting engineer of the Association. The lecturer dealt in simple language with the construction of boilers, and the need for various fittings, the cause of scaling, pitting, and priming, and how to avoid same, and illustrated his remarks by experiments and diagrams. The second "petrol" lecture was given on November 5.

LONDON POLICE AND THE STOPPING PLACES OF OMNIBUSES.—In reply to representations made by Ilford Tramways Committee, the Commissioner of Police has informed them that the police had instructions to prevent, as far as possible, motor 'buses and tramcars from stopping level with each other, and also to see that the slow-going traffic was kept as much as practicable to the near side of the road. Renewed attention had, however, been called to the matter, and the police would continue to do all in their power to obviate danger to pedestrians and obstruction to traffic.

MOTORISTS AND THE REPORT ON LONDON TRAFFIC.—The Hon. A. Stanley, M.P., chairman of the Royal Automobile Club, at the October meeting of the club committee, pointed out the vital importance to all users of the road of seizing the opportunity afforded by the report of the Select Committee on London Motor Traffic, to make a well-considered effort to obtain by legislation proper regulations for motor traffic under a proper authority. He proposed to apply for a meeting of the National Automobile Council at a later date to consider the proposals which would be put forward by the club.

OMNIBUS COMPANY'S REQUEST TO EAST HAM TRAMWAYS.—In reporting to East Ham Council on a request received from the London General Omnibus Company for the Council to remove their standards in a portion of Forest Drive, in view of the possible danger to passengers on the 'buses, Mr. C. Ullman, the tramways manager and engineer, pointed out that considerable expense would have to be incurred in the near future in the Manor Way, where subsidences in the track and roadway have occurred since the inauguration of the service of omnibuses. The annual report shows a deficiency of £1,217 on the undertaking during the year ended March 31 last, being an increase of £729. The income was £57,969, and the working expenses £45,808.

PROFIT FROM TODMORDEN MOTOR OMNIBUSES.—The persistence of the Town Council in adhering to petrol omnibus traction, despite losses caused by the heavy cost of working machines ordered some years ago, is bringing a reward. The Mayor announced at the last meeting of the Corporation that the Motor Omnibus Committee had had a difficult task in the past years, and it was pleasant to read in the minutes that during the past month the 'buses had carried over 87,000 passengers. After the payment of all charges they had made a profit of nearly £150. On October 30 the Motor Omnibus Committee reported that in comparison with the heavy losses in the early stages of the undertaking, there had been a profit on the past half-year of £485. The successful inauguration of workmen's 'buses was mentioned, and the committee hope to make further developments in that direction.

CONTINENTAL TYRES FOR RAILLESS CARS.—The municipal authorities of South Africa are showing an emphatic and growing appreciation of motor vehicles for their work. Having regard to the heavy nature of this work and the trying conditions of the South African roads, solid rubber tyres have obviously been the principal factor in this evolution of heavy commercial vehicles. In this development the Continental "T" pattern solid tyre has played a conspicuous part. These tyres have been selected for the six vehicles which the Railless Electric Traction Company have on order for Boksburg, the ten "Cedes" cars for Germiston, and the ten "R.E.T." cars for Bloemfontein. The qualities which make for efficiency in solid tyres are durability and resiliency, and these are required in a marked degree for South African work. From the fact that the municipal authorities have exhibited a preference for Continental tyres, it must be evident that they have satisfied themselves of the special fitness of this make for the severe work and rough roads of the country.

BRADFORD TRAMWAYS MANAGER AND THE PETROL OMNIBUS.—In his annual report on the Bradford Corporation Tramways, the general manager (Mr. C. J. Spencer) says: "It is held by some, who are qualified to speak, that the day is not far distant when the tramcar will be superseded by some better vehicle. In what way I am not quite able to appreciate. The petrol-propelled vehicle (motor 'bus) has undoubtedly made great strides, but unless it develops a great deal further than what seems possible at the present time I do not think that it is likely to supersede tramways in Bradford. Prophecies of any sort are, however, dangerous and uncertain, but I think it may be assumed that the Bradford Corporation will, in the future, as in the past, keep well in touch with the development of newer systems of transit, and if it can be demonstrated at any time, after taking everything into consideration, that a better system is available for public use, they will not be slow to take advantage of it. Steady repayment of the debt on the tramways makes it possible for the Corporation to consider such a change without consternation, though I do not think, so far as I can see at present, that there is any need to anticipate any radical change in its transit methods for some years to come. On the other hand it will, I believe, pay the Corporation to keep well in front of tramway development by spending generously in new rolling stock, permanent way, etc,"

## WEEKLY LIST OF TENDERS INVITED.

### THE SOUTH INDIAN RAILWAY COMPANY, LTD.

The South Indian Railway Company, Limited, are prepared to receive tenders for the supply of :—

Tie Bars, Gibs and Cotters for 80lb. and 50lb. Rails, about 118 tons.

Specifications and forms of tender may be obtained at the Company's Offices.

Tenders, addressed to the Chairman and Directors of the South Indian Railway Company, Limited, marked "Tender for Tie Bars, Gibs, and Cotters," must be left with the undersigned not later than 1 o'clock, on Wednesday, November 26, 1913.

The Company is not bound to accept the lowest or any tender.

A charge, which will not be returned, will be made of 10s. for each copy of the specification.

Copies of the drawings may be obtained on payment at the Offices of Robert White, Esq., M.Inst.C.E., Consulting Engineer to the Company, 3, Victoria Street, Westminster, S.W.

By order, V. E. DE BROE, M.Inst.C.E.,
for Managing Director.

Company's Offices,
91, York Street, Westminster, S.W.,
November 11, 1913.

### METROPOLITAN BOROUGH OF FULHAM.

TURBO-ALTERNATOR AND CONDENSER.

The Council is prepared to receive tenders for the supply, delivery, and erection of a 2,500 Kilowatt Turbo-Alternator with Condensing Plant.

Specification, plan of available space, form of tender, etc., can be obtained from Mr. A. J. Fuller, Borough Electrical Engineer, Townmead Road, Fulham, S.W.

Sealed tenders are to be sent in by 12 noon, on Wednesday, the 26th day of November, 1913, to the undersigned, endorsed "Tender for Turbo-Alternator."

The Council does not bind itself to accept the lowest or any tender.

Town Hall, Fulham, S.W. J. P. SHUTER.

### COUNTY COUNCIL OF KING'S COUNTY.

STEAM TRACTOR AND TIPPING WAGGONS WANTED.

The County Council of King's County are prepared to consider tenders for the supply, delivery, and erection complete, at a cost not to exceed £650, of One Compound Steam Tractor, Two 6-Ton End Tipping Waggons, in accordance with the specifications and conditions, which may be obtained upon application.

Tenders, enclosed in a sealed envelope, endorsed "Tender for Steam Tractor and Waggons," and addressed to the Presiding Chairman of the County Council, must be delivered at the Court House, Tullamore, on or before Tuesday, November 25, 1913. The County Council do not bind themselves to accept the lowest or any tender.

By order, CHARLES P. KINGSTON.
Secretary.

Court House, Tullamore.

### BURMA RAILWAYS COMPANY, LTD.

The Board of Directors of the Burma Railways Company, Limited, are prepared to receive tenders for the supply of 204,000 Steel Coachscrews for 60lbs. (B.S.) Flatfooted Rails.

For each specification a fee of 10s. will be charged, which will not be returned. Tenders, enclosed in sealed envelopes addressed to the "Chairman and Directors" and endorsed "Tender for Steel Coachscrews," must be delivered at the Company's office not later than noon on Tuesday, 18th November, 1913.

The Directors do not bind themselves to accept any or the lowest tender, and reserve the right to divide the order. The material is very urgently required in Burma.

By order of the Board,
W. HOME,
Managing Director.

199, Gresham House,
Old Broad Street, London, E.C.
November 12, 1913.

### PLYMOUTH CORPORATION.

The Plymouth Corporation is prepared to receive tenders for the undermentioned works in connection with the Electricity Undertaking of the Borough, viz. :—

Contract No. 31.—Ironclad High-Tension Switch Panels.

Copies of the conditions, specification, and form of tender may be obtained from the undersigned on the deposit of one guinea for each copy, which will be returned after receipt of a *bonâ-fide* tender upon the prescribed form and within the stated time.

Should a tender be withdrawn the amount of the deposit will be forfeited.

Sealed tenders, endorsed "Contract No. 31," must be delivered to the undersigned not later than December 1, 1913.

The Corporation does not bind itself to accept the lowest or any tender.

(Signed) E. G. OKELL,
Borough Electrical Engineer.

November 11, 1913.

### THE ASSAM BENGAL RAILWAY COMPANY, LTD.

The Assam Bengal Railway Company, Limited, is prepared to receive tenders for :—

Wheels and Axles.

Specifications and tender forms may be obtained at the offices of the Company, Bishopsgate House, 80, Bishopsgate, E.C. A fee of £1 1s. is charged for each specification, which cannot under any circumstances be returned. Drawings may be had at the cost of the tenderer by application to Messrs. Hodges, Bennett and Co., 113, Cheapside, E.C.

Tenders must be delivered at the Company's offices not later than noon on Monday, December 1, 1913. The Directors do not bind themselves to accept the lowest or any tender.

By order of the Board,
OSWALD J. MILNE,
Secretary.

### COUNTY BOROUGH OF SOUTHAMPTON.

STEAM TURBO-ALTERNATOR.

The Corporation invite tenders for the supply, delivery, and erection of a Steam Turbo-Alternator at the Electricity Supply Station, Western Esplanade.

A specification and form of tender may be obtained upon application to the Borough Electrical Engineer.

Sealed tenders, endorsed "Tender for Alternator," must be delivered at the Town Clerk's Office.

No pledge is given to accept the lowest or any tender

R. R. LINTHORNE,
Town Clerk.

Town Clerk's Office,
Municipal Offices, Southampton,
November 11, 1913.

Digitized by Google

### THE GREAT INDIAN PENINSULA RAILWAY COMPANY.

The Directors are prepared to receive tenders for the supply of the following Stores, namely :—

Turpentine.
Fencing Wire Strand.
Bellows.
Disinfecting Powder, etc.
Steelwork for Bridges.
Spare Parts for Carriages and Wagons.
Helical and Volute Springs.

Specifications and forms of tender may be obtained at this Office, on payment of the fee for the specification, which payment will not be returned.

Tenders must be delivered in sealed envelopes, addressed to the undersigned, marked "Tender for Turpentine," or as the case may be, not later than 11 o'clock a.m., on Thursday, November 20, 1913.

The Directors do not bind themselves to accept the lowest or any tender.

R. H. WALPOLE,
Secretary.

Company Offices,
48, Copthall Avenue, London, E.C.,
November 12, 1913.

### LONDON—INDIA OFFICE.

The Secretary of State for India in Council is prepared to receive tenders from such persons as may be willing to supply—

Steel Sleepers.

The conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W., and tenders are to be delivered at that office by 2 o'clock p.m. on Tuesday, November 25, 1913, after which time no tender will be received.

H. J. W. FRY,
Director-General of Stores.

India Office, Whitehall,
November 12, 1913.

### EGYPTIAN WAR DEPARTMENT.

Tenders are asked for the supply of

Mild Steel Tees.
,, ,, Angles.
,, ,, Bars and Sheets.

All particulars obtainable from Sir A. L. Webb, K.C.M.G., Queen Anne's Chambers, Westminster, S.W.

Tenders returnable December 17, and to remain open seven days.

## MERIT AND DEMERIT MARKS.

Too little importance appears to be attached nowadays to the bestowal of merit marks on car employees. Probably the reason is to be found in a desire to lessen the amount of clerical work that such a scheme would involve on undertakings whose growth has brought about a large increase in the number of hands. It is possible, however, to adopt a simple system entailing little or no labour. We refer to the old method of awarding merit badges, which now seems to have almost disappeared. These badges were awarded for neat appearance, attention to passengers, and general good conduct, and their possession meant an additional shilling per week to a man's pay. A reward of this kind would appear to be especially useful on undertakings where demerit marks are recorded. The latter system in itself is a more humane way of dealing with men than by the infliction of punishments that entail suffering on the part of a man's dependents. It was this aspect that led to the adoption of the demerit mark system some time since by the management of the London United Tramways, but it has now had to undergo some modification. The recent concessions made to the London General Omnibus section of the allied companies' men led to the London United Tramways' employees forwarding a request for a revision of the demerit mark regulations. Among the offences for which these marks are given are the missing of fares and excess fares, reading newspapers while on duty, failing to stop at a compulsory stopping place and also at church stopping places during hours of divine service. Hitherto a first offence entailed a warning by letter, a second one resulted in ten marks being put against the offender, with five marks in the event of neglect to collect an excess fare. When the total number of marks recorded reached sixty a man has been discharged. Three of the depôts desired the abolition of the system, and one depôt asked that it should be revised. The management invited delegates, consisting of a driver and conductor from each depôt, to attend a conference, with the result that the rules now provide that each offence involving five demerit marks or less will, on a first occasion, be dealt with by a caution. All new men will receive merit and demerit marks on the same footing as men of longer service, but at the end of six months half of the total demerit marks received by them will be taken from their records. In place of the present maximum of demerit marks warranting dismissal, a man will be allowed sixty marks for the first two years' service; between two and four years, seventy-five marks; between four and six years, ninety; between six and eight years, 105; between eight and ten years, 120. The length of service dates from July, 1910. When demerit marks are entered against any man he has the right of appealing within seven days, and such appeal will be dealt with by a committee comprising the traffic superintendent and other officials. It will be interesting to learn in what manner the management of the Nottingham tramways propose to overcome the unreasonable objections of their employees to the bonus system which was inaugurated last Christmas in connection with the adoption of car meters, in consequence of the continuous increase in the amount of power used by the cars. The bonus scheme allowed for the division of the sum of £150 per annum in amounts ranging from 20s. to 5s. each to the 66 drivers who showed the best results, with half these amounts to the conductors working with the drivers. The result has been that during the nine months ended September 30 the cost of power was reduced by no less than £2,900. During the same period 1,000,738 more passengers were carried, and the number of accidents was considerably less, whilst the amount paid in compensation was reduced by nearly 50 per cent. The system remains in force pending the completion of an amended arrangement to take its place. In reporting this decision to the men their deputation stated that they understood the new method would be based on merit, but if that meant the fixing of a standard of current consumption it would probably be regarded as unsatisfactory. They also claim that a uniform standard of current allowance should be accompanied by a uniform regulation as to the number of standing passengers allowed in the car.

## TRAMWAY CHAIRMEN FOR 1913-14.

The reorganisation of the Town Councils after the annual November elections is now being completed. In the great majority of cases the chairmen and vice-chairmen of the various Tramway Committees have been re-appointed for the ensuing year, as will be seen from our subjoined list. The list will be continued in our next issue.

| TOWN. | CHAIRMAN. | VICE-CHAIRMAN. |
|---|---|---|
| Accrington .. | Alderman Higham .. .. | *Councillor Morley. |
| Ayr .. .. | Police-Judge Ferguson .. | *Bailie Gould. |
| Bacup .. .. | Alderman J. H. Maden .. | Alderman J. Craven-Hoyle. |
| Belfast .. .. | Alderman Sir R. Anderson .. | Alderman J. S. Finnigan |
| Birkenhead .. | Councillor H. Halsall .. .. | ——— |
| Birmingham .. | Councillor H. Barrow .. .. | ——— |
| Brighton .. .. | Alderman F. T. Wilson .. | ——— |
| Burton-on-Trent .. | Alderman J. S. Rowland .. | Alderman T. E. Lowe. |
| Chester .. .. | Alderman J. Jones .. .. | Councillor J. Dodd. |
| Chesterfield .. | Alderman Shentall .. .. | ——— |
| Derby .. .. | Alderman R. W. Spriggs .. | Councillor Dean. |
| Doncaster .. | Councillor Stirling (Mayor) .. | Councillor Balmforth. |
| Dundee .. .. | Councillor G. A. Johnston .. | ——— |
| Leeds .. .. | *Alderman R. A. Smithson .. | |

* Denotes a change in the chairmanship or vice-chairmanship.

**Omnibuses for Montreal.**—A first batch of 150 motor omnibuses have been built by the Associated Equipments, Limited, and Daimler Company to the order of the Canadian Auto-Bus Company of Montreal. The vehicles are heated electrically and lighted.

# CONVEYANCE OF GOODS ON LIVERPOOL TRAMWAYS.

A Report by the General Manager.

Mr. C. W. Mallins, the general manager of the Liverpool Corporation tramways, in a report to the Tramways and Electric Power and Lighting Committee deals exhaustively with the proposal to utilise the tramways for the conveyance of goods to neighbouring towns. He remarks as a preliminary caution that none of the British Tramway Authorities have attempted to utilise their systems to any great extent for the conveyance of goods, and there is consequently no precedent as a guide. The question, however, appears to be of such vital importance to the trade of the Port and the City of Liverpool that he considers that every effort possible should be made to increase the transport facilities, particularly bearing in mind the difficulties which the mercantile community are at present experiencing in connection with the transport of merchandise. In the year 1882 the tonnage entering and leaving the Port of Liverpool amounted to 16,208,272 tons, whilst in 1912 it had risen to 34,654,830, or an increase of 113 per cent. in 30 years.

Mr. Mallins then proceeds in part as follows :—

The traffic congestion problem as it stands at present may be divided under two heads :—

(1) Local Traffic between Docks and Railway Stations and Warehouses.—A great portion of this is dealt with by horse traction entailing the use of a very large number of vehicles, necessarily of small carrying capacity, which can only move at a slow rate; they consequently increase the congestion on the limited quay space and on roads adjacent to the docks and stations.

The general manager is of opinion that, if a thoroughly well organised system equipped with the most modern type of mechanically-propelled vehicles—possibly of the electric storage battery type, with a cheap power supply—were provided to deal with the work now carried out by the horse vehicles, the work could be performed by 50 per cent. fewer vehicles, which would materially lessen the congestion, and it is reasonable to assume that the work would be carried out at a much lower cost, thus solving the local portion of the problem. The general manager does not enter into the details of a scheme on these lines, but leaves the suggestion to the consideration of those responsible in the matter.

(2) The Transport of Merchandise between the Docks and the Manufacturing Centres.—The facilities offered by the railway companies do not appear to be adequate, as it is alleged that delays frequently occur in transit, causing serious inconvenience and loss, while in addition the rates charged are considered excessive; the greatest difficulty, however, appears to arise from the slow delivery of the goods.

Through the courtesy of an old and highly esteemed firm of cotton merchants, the general manager has ascertained that the rate charged for the conveyance of both American and Egyptian cotton between the Liverpool Docks and Bolton, Lancashire, a distance of 32 miles, is 8s. 4d. per ton, exclusive of all terminal charges. This works out at $3\frac{1}{8}$d. per ton mile. The charges for the transport of other merchandise vary according to the class of goods. It is not surprising therefore that the merchants and traders are anxious to discover a cheaper and more expeditious system of transport, and they naturally look to the tramways to utilise their system for the purpose, if possible.

The great advantage of a cheap and expeditious system of transport for goods is evident, as are the difficulties to be surmounted before such a system could be brought into operation. The first consideration must necessarily be as to what facilities the Mersey Docks and Harbour Board are prepared to grant to enable any new system of transport to enter the Dock Estate; this is undoubtedly the key of the position so far as the solution of the Docks traffic problem is concerned.

The general manager is of opinion that it is quite impracticable to operate a goods service of any magnitude over the existing lines. The Knotty Ash and Pier Head route is the only one which has a connection with tramways outside the Liverpool system, but the passenger traffic on this route is very heavy, necessitating a very frequent service of cars between the hours of 4.30 a.m. and 12.30 midnight. At the maximum time of traffic, cars run at intervals of every $1\frac{1}{2}$ minutes and, at the minimum, every 4 minutes. It will, therefore, be seen that it would be quite impossible to operate a goods service over this route in addition to the passenger service before mentioned, except for a limited number of hours in the early morning, and the fact must not be overlooked that repairs have to be carried out, both to the track and overhead equipment, during these hours. The general manager considers it would be quite impracticable to attempt to utilise any of the existing lines in the central area of the city for the transport of merchandise on any considerable scale, as they are at present taxed to their utmost capacity in dealing with the passenger traffic, which is every day becoming a more pressing problem, and one which it will be necessary for the committee to seriously consider in the not distant future. The most that could therefore be done with the existing lines would be to try a system of goods transport tentatively on a very limited scale, say, three or four trains per day, entailing a comparatively small capital expenditure, and, if found successful, a more elaborate system could be established on the following lines, provided that the Mersey Docks and Harbour Board, and the Bootle Corporation, were prepared to grant the necessary facilities, and further, that the merchants and shippers gave their full support to the scheme, by guaranteeing a traffic of at least 1,314,000 tons of merchandise per annum from and to the Docks, at, say, $2\frac{3}{4}$d. per ton mile by the new system, exclusive of terminal charges. This would provide a revenue amounting to £105,394 per annum, which would cover the operating expenses and standing charges, and also reserve, renewal and depreciation, and allow a reasonable margin for other contingencies. It is quite probable that a considerable volume of mineral traffic and farm produce would be transported by the new system, which would materially help in securing the necessary guarantee to cover the charges before referred to.

The permission of the Mersey Docks and Harbour Board to electrify the Dock Railway, with the necessary connections, would have to be obtained, the total length of which is 22 miles single line, and the approximate cost £154,000. In this connection it might be considered desirable to lower the level of the portions of the railway, abutting on the approaches to the landing stage, from the street level to a shallow tube, and by that means obviate a great deal of the obstruction that now takes place in connection with the operation of the railway, the cost of which is *not* included in these estimates.

In the alternative, if it were considered impracticable to electrify the Dock Railway, the construction of a line of tramways parallel with the railway, outside of the Dock Estate, in the public streets, with the necessary connections to the Estate, might be undertaken. The total length would be about $22\frac{1}{2}$ miles single line, and the approximate cost £157,500.

The construction of a tramway to deal with the North Docks traffic, between Alexandra Dock and Knotty Ash terminus, would also be necessary, the length of which is about $7\frac{3}{4}$ miles single line, including passing places; the cost would approximately be £54,250. The consent of the Bootle Corporation would, of course, be necessary before this line could be laid down.

The construction of a tramway for the purpose of dealing with the South Docks traffic, between Brunswick Dock and Knotty Ash terminus, would also be necessary, the length of which is about five miles single line, including passing places, and would cost approximately £35,000.

With these connections it would be possible to operate a service of trains, consisting of one motor and two trailer wagons, for which the Board of Trade would be prepared to grant provisional authority. These trains would have a total carrying capacity of 25 tons each, and would run at intervals of every 10 minutes on each of the branch lines, making a total of 288 trains per day, capable of conveying 7,200 tons of goods, or a total of 2,628,000 tons per annum to the city boundary. In order to equip these lines to their full capacity the following would be the approximate rolling-stock necessary :—30 motor vehicles and 72 trailer wagons; but, as the South Lancashire Tramways Company's system is only capable of dealing with about 144 trains per day, it would not be necessary to purchase the whole of the rolling stock until the company increased the capacity of their system, which it is understood they are prepared to do if the result of an experiment warranted the expenditure. Fourteen motor vehicles and 28 trailer wagons would be capable of conveying 3,600 tons per day, or 1,314,000 tons per annum, and, with spares, would cost approximately £22,000. This instalment of rolling stock would be sufficient to establish the system and could be increased as traffic developed. In order to provide the necessary shed accommodation, another £5,000 must be added. The South Lancashire Tramways Company and other undertakings would, of course, provide their own portion of the rolling stock. Adding these latter sums for rolling stock and shed accommodation to the sums already mentioned for the construction of lines, the total capital expenditure would amount to £273,750, and an annual sum of £90,655 would be required for operating costs and standing charges, and reasonable allowance for renewal and depreciation, viz. :—

ESTIMATES OF ANNUAL EXPENDITURE AND INCOME.

| | |
|---|---|
| *Traffic.* | |
| Superintendence | £600 |
| Wages of motormen, conductors, and other employees | 9,000 |
| Cleaning and oiling vehicles | 1,424 |
| Cleaning and sanding track | 250 |
| Fuel, lighting, and water for depôts | 200 |
| Uniform of employees | 500 |
| Miscellaneous charges | 1,000 |
| | £12,974 |
| *General Charges.* | |
| Permanent way | 9,000 |
| Electrical equipment | 1,500 |
| Buildings and fixtures | 120 |
| Workshop and tools | 50 |
| Motor and trailer wagons | 2,280 |
| Power expenses | 20,000 |
| General and management expenses (including rates & taxes) | 5,000 |
| Interest and sinking fund | 17,800 |
| Renewal and depreciation | 13,690 |
| | £82,414 |
| Add 10 per cent. for contingencies | 8,241 |
| Total estimated expenditure | £90,655 |
| Total estimated revenue | £105,394 |
| Balance | £14,739 |

Digitized by Google

The sum mentioned for capital expenditure is exclusive of the cost of counting-house facilities, and the provision of a gridiron at the City Boundary, Knotty Ash, where the goods trains would be taken over by the South Lancashire Tramways Company.

The South Lancashire tramways are connected with several Lancashire towns and, by building a certain length of tramways, a junction could be established with several Yorkshire towns, which are connected by various tramway systems. Unfortunately in some of the systems the track is not of the standard gauge, but this difficulty could be surmounted by certain mechanical arrangements. If the trackless system were adopted, however, this difficulty would not exist. The chairman of the South Lancashire Tramways and of the Prescot Light Railway (the Hon. Arthur Stanley, M.P.) at a recent interview with the chairman, deputy-chairman, and general manager, stated that he would be prepared to co-operate with the committee in any scheme they might bring forward for the transport of merchandise over his system.

From the foregoing figures it is quite obvious that to introduce a system of any magnitude for the transport of merchandise by ordinary tramways would involve a large capital expenditure, and, having regard to this fact, it is desirable to consider the practicability of the trackless trolley system as an alternative, although, like the ordinary tramways, this system has not been adopted to any extent in this country for the conveyance of goods. The promoters of the trackless trolley system state that it is quite practicable for the transport of goods, and that it could be established at a cost of £1,700 per route mile, including all charges other than rolling stock, as compared with £7,000 per mile of single track for ordinary tramways, or a total sum of £40,800 for the construction of the 24 route miles required, as compared with £246,750 for the same length of ordinary tramways. Before the system could be established, however, it would be necessary to obtain Parliamentary powers, which would involve certain further expenditure. This, together with other charges, would amount to, say, another £4,000, or a total of £44,800, and in order to equip the routes with the necessary rolling-stock to convey the quantity of merchandise required to cover the operating costs and standing charges for the first instalment, 24 trains would be required, costing £1,900 each, or a total of £45,600, with an additional sum of £10,000 for spare trucks and shed accommodation. Adding this sum to the amount already mentioned for the erection of overhead lines and other equipment would make a total of £100,400, with an annual sum of £78,136 for operating costs and standing charges, renewal, and depreciation; in order to provide this sum it would be necessary to have a guarantee from the merchants and shippers that they would be prepared to transport 1,314,030 tons from and to the Docks at, say, 2½d. per ton mile, exclusive of terminal charges, amounting to £65,812. This extremely cheap rate per ton mile is possible owing to the comparatively small capital expenditure necessary to establish the trackless system.

The operating costs and standing charges are estimated as follow:—

TRACKLESS TROLLEY SYSTEM.
ESTIMATES OF ANNUAL EXPENDITURE AND INCOME

*Traffic.*

| | £000 |
|---|---|
| Superintendence | |
| Wages of motormen, conductors, and other employees | 10,850 |
| Cleaning and oiling vehicles | 1,040 |
| Fuel, light, and water for depôts | 200 |
| Uniform of employees | 550 |
| Miscellaneous charges | 1,000 |
| | £14,840 |

*General Charges.*

| | |
|---|---|
| Electrical equipment | 1,500 |
| Buildings and fixtures | 120 |
| Workshop and tools | 50 |
| Maintenance of vehicles (steel tyres) | 11,109 |
| Power expenses | 20,000 |
| General and management expenses (including rates & taxes) | 5,000 |
| Interest and sinking fund | 10,322 |
| Renewal and depreciation | 8,032 |
| | £71,053 |
| Add 10 per cent. for contingencies | 7,105 |
| Total estimated expenditure | £78,136 |
| Total estimated revenue | £95,812 |
| Balance | £17,676 |

The tonnage mentioned above would be required to cover standing charges and operating expenses, but the system would be capable of dealing with 2,628,000 tons per annum, equal at 2½d. per ton mile to £191,625 per annum; this would make it both extremely cheap to the merchants and profitable to the operators.

On making a comparison between the cost of constructing an ordinary tramway, and the trackless trolley system, it becomes quite clear that the latter system is infinitely cheaper to construct, and if the statements made by the promoters are correct, it would be found equally as efficient for the purpose, and would possibly prove more flexible in dealing with the problem before the committee; but before the system could be recommended the promoters would have to demonstrate satisfactorily the practicability of the system in actual working.

The whole of the figures quoted are approximate, but ample provision is made to cover every item of expenses mentioned.

The costs of collecting and distributing depôts have not been included, as they are not considered necessary in connection with the Liverpool portion of the scheme; for this would only deal with the traffic between the docks and the city boundary at Knotty Ash, where, if the scheme developed, a gridiron and sorting depôt would be necessary as referred to above. No doubt collecting and distributing depôts would be necessary for the other tramway undertakings which would deal with the traffic beyond the Liverpool boundary.

## L.C.C. TRAMWAY MATTERS.

STOPPING PLACES FOR CARS AND OMNIBUSES.

The Highways Committee presented a report at last Tuesday's meeting of the London County Council with reference to communications from the Commissioner of Metropolitan Police in regard to suggested tramway car stopping places. With a view to drawing up regulations the Commissioner had proposed a conference with representatives of the Council and the London General Omnibus Company, but the Committee had suggested to the Commissioner that this question should stand over until the Council had an opportunity of considering the important matters raised by the proposals in the report of the Select Committee on Motor Traffic. In the meantime proposals with regard to stopping places of tramcars and motor omnibuses at New Cross Gate and the Marquis of Granby had been submitted by the Commissioner. The proposals consisted in some instances of an arrangement by which the omnibuses would pick up and set down passengers at the natural traffic points, while the tramcars would be required to stop at a little distance from these points. The numbers of tramway passengers at these places were approximately five times as many as the numbers of omnibus passengers. It appeared to the Committee that the Commissioner's proposals would involve considerable inconvenience to the larger portion of the travelling public. Through tramcar services at these points had been in operation for a much longer time than the omnibus services, and in view of the much greater extent to which they were used it did not seem to the Committee desirable to make alterations which would impair their utility. They had suggested to the Commissioner that certain alternative arrangements should be made, and these were now under consideration.

The Committee's action was approved.

PETROL-ELECTRIC CARS.

Reference was made by the Committee to the fact that the Council on July 30 last year sanctioned expenditure of £2,400 for the alteration and equipment of three horse-cars as self-propelled tramcars for the purpose of enabling an examination to be made of the possibilities of this system of traction, which it was proposed to install on the tramways in Burdett Road and Grove Road. A service of petrol-electric cars had since been run experimentally on a route in another part of London (Tooley Street to Greenwich Church) in order that an idea might be gained of the cost of running, etc., of this system. The result of this experiment had convinced the Committee that the Burdett Road and Grove Road route was not suitable for working by means of petrol-electric cars. They were giving consideration as to the best method to be adopted for dealing with tramways on this route.

Consideration of this report was adjourned.

POWER TO WORK TRAMWAYS.

The Council were reminded that their Tramways Act of 1913 was considered by the House of Commons on July 14, when Clause 30, which provided for the Council working certain small lengths of tramways in London which were not covered by the Council's Tramways Act of 1899, and Clause 31, which provided for the London United Tramways having running powers over the lines in London about to be purchased from the company by the Council, were deleted. The Highways Committee now proposed and the Council agreed that authority be sought in the session of Parliament of 1914 to enable the Council to work all tramways which had been purchased since the passing of the Council's Tramways Act of 1896, or which might hereafter be purchased.

GREENWICH POWER STATION PLANT.

In connection with the extension of the plant at Greenwich generating station, the Committee reported that it was necessary that certain minor works should be carried out, and these could not very well be made the subject of contracts. They recommended that the undermentioned works should be carried out at a cost not exceeding £1,000 by direct employment of labour under the Highways Committee:—(1) The supervision of the installation of high-tension switchgear; (2) the power wiring for auxiliary motors; (3) the re-arrangement of the electric lighting of the station; (4) the electric lighting in connection with the laying of condensing water pipes; (5) any other incidental works of a like nature.

The recommendation was adopted.

HIGHWAYS COMMITTEE'S LEGISLATIVE PROPOSALS.

Considerable discussion took place in regard to the four tramway extension schemes, consideration of which had been postponed from last week, and the minority severely criticised next year's programme on the ground of its inadequacy.

Mr. G. H. Hume, the acting chairman of the Highways Committee, defended his policy on the ground that removal of dead-ends and linking up was imperative to ensure success of any larger extension that might be sanctioned should a new traffic authority be created.

Eventually, the Committee's proposals were approved.

## MISCELLANEOUS NEWS AND NOTES.

**Lifting Jacks for Cars.**—Oldham Tramways Committee have decided to provide the latest lifting appliances for all of the cars, the crews to be instructed in their use.

**Light Railway Rules.**—Revised rules with respect to applications to the Light Railway Commissioners under the Light Railways Acts, 1896 and 1912, have been issued by the Board of Trade.

**Quicker Fare Collection.**—Ayr Tramways Committee have asked the manager to report whether means could be devised for a speedier collection of the fares during the race meetings and other times of heavy traffic.

**Midday Return Tickets.**—Oldham Tramways Committee have asked the manager to report upon the question of issuing penny return fares in order to enable workpeople to go home to their midday meal. Such a service was recently instituted at Darwen.

**Power Plant and Motor Appliances for Bradford.**—On November 13 a Local Government Board inquiry was held at Bradford into the Corporation's application to borrow £91,250 for extensions of plant at Valley Road generating station, and £2,440 for the purchase of two motor turbine pumps and a motor first-aid tender for the Fire Brigade.

**Longer Truck Experiment at Plymouth.**—Alderman Phillips has reported to the Town Council that the experiment of trying a car with a longer truck promised to be successful. There was less power used and less strain on the curves. If it succeeded they might apply to the Board of Trade for permission to use top-covered cars.

**Greenock Municipalisation Scheme Rejected.**—By 12 votes to 8 the Corporation of Greenock on November 11 rejected a motion by Councillor Mitchell to give notice to the Tramway Company that it had been decided to exercise the option to terminate the lease at the first break, on May 15, 1914. By 12 votes to eight the Council renewed the lease to the present company.

**Carriage of Mail Bags by Tramcar.**—Sheffield Tramways Committee have agreed to convey mail bags by tramcar without being accompanied by a post office official at 2d. per bag per journey for bags not exceeding 28 lbs., and 3d. per bag per journey for bags exceeding 28 lbs. but not exceeding 56 lbs., the Corporation not taking or accepting any liability in connection with the work.

**Increases for Newcastle Employees.**—The Tramways Committee have increased the pay of motormen and conductors by 1s. per week at the end of four years' service, making their wages 33s. per week. The wages of body-makers have been fixed at 9d. per hour, and those of carriage painters have been raised from 8¼d. per hour to 8½d. per hour, in each case for a 53-hours' week.

**Newport and Track Maintenance.**—After a somewhat heated discussion, the Corporation, on November 10, agreed to the Works Committee and the Tramways Committee each appointing five members with a view to considering a reasonable solution of the matter of the maintenance of the tramways permanent way. In reply to a question by a Councillor, Mr. A. Nichols Moore, electrical and permanent way engineer, said he was trained as a civil engineer before he became an electrical engineer. For about eighteen months he had supervision of road-making work.

**Metropolitan Association of Electric Tramways Managers.**—At the last monthly meeting of the members held at the Municipal and County Club, Whitehall Court, Whitehall, S.W., the following were present:—Messrs. Ullmann (East Ham), Bruce (L.C.C.), Coveney (Erith), Schofield (Leyton), Harvey (Ilford), Moffett (West Ham), Hammond (Metropolitan Electric), Mason (South Metropolitan), and Goodyer (Croydon), hon. secretary. Messrs. Ullmann and Coveney were re-elected chairman and vice-chairman respectively, and Mr. Goodyer was re-appointed hon. secretary.

**New and Prospective Work.**—A special meeting of York City Council on November 11 decided to make application to the Light Railway Commissioners for powers to extend two of the tramways.—A report has been prepared for Stirling Council by the town clerk, the surveyor, and the electrical engineer, estimating the cost of electrifying the tramways and making extensions of the system at £78,100.—Pontypridd Council have directed the surveyor to prepare plans for a tramway from Machine Bridge to connect with the existing tramway in Cardiff Road, in readiness to advertise the contracts.

**A Further Difficulty at Oxford.**—The City Council have rejected, by 27 votes to 25, the proposal of the Tramways Committee in favour of accepting the National Electric Construction Company's scheme for running petrol-electric tramcars in the chief thoroughfares, and overhead trolley cars and motor omnibuses for other routes. It was decided to inform the company that the Corporation relied on existing rights as defined in several Acts of Parliament affecting the parties. An amendment to instruct the City Solicitor to issue a writ forthwith for the recovery of the liquidated damages was defeated. Several members advocated the use of motor omnibuses, and two Colleges sent letters in support of that idea, but it was stated that this course could not be followed unless the horse tramways were purchased at a cost of £28,000. Alderman Carter mentioned that he had received several offers from omnibus companies to come to the city.

**A London Car Overturned.**—Shortly after 8 a.m. on Thursday a London County Council double-deck car was descending the easy gradient at the bottom of Mitcham Lane, Streatham, on its way to Tooting Broadway, when the driver lost control, and the car ran off the line at the wide curve into the Southcroft Road. After travelling about fifteen yards on the wood paving towards the near side of Mitcham Lane, the car overturned on the falling side of the camber, which is rather pronounced at this spot. In its fall the vehicle knocked down a telephone standard and a large number of wires. The roof of the top deck became detached and considerable damage was done to the body. There were no passengers in the car, but the conductor and motorman sustained slight injuries. It is stated that the car was brought to a standstill at the first compulsory stop half-way down the incline, and that the driver found himself in difficulty with the brake before reaching the second compulsory stop about 120 yards further on and 25 yards from the curve. In order to clear away the wreck, the body was detached from the bogie truck and taken away on a steam tractor.

**Bristol Tramways Purchase Question.**—By the statutory majority the Corporation on November 10 carried a resolution authorising the promotion of a Bill to permit of the purchase of the Bristol Tramways Company's undertaking, and to take a poll of the ratepayers upon the question of the acquisition of the lines under the Tramways Act, 1870. Councillor Witty objected to the matter going forward until the Tramways Committee had published the secret figures and reports in their possession. He criticised the experts who had been consulted by the Council, saying that one was managing director of the Leeds tramways, which had paid large sums towards the relief of the rates, but had starved its repairs and renewals. In reply, Alderman Pearson, chairman of the committee, said Mr. Hamilton was not managing director of the tramways. He was manager, and was no more responsible for the allocation of the tramway accounts than any other official. The Council themselves settled what they would do with the profits, and Mr. Witty would find that Mr. Hamilton was not always in accord with the Council as to what should be done with the profits.

## CONTRACTS AND ORDERS.

**Derby Council** have sanctioned a proposal by the Tramways Committee to place two automatic point controllers at the junction of Douglas Street and Osmaston Road, at a cost of £80.

**Walsall Council** have accepted the tender of the British Westinghouse Company for the supply of a motor and starter, at £27 9s., and of the Callender Cable and Construction Company for laying a length of cable, at £123 17s.

**The Titan Trackwork Company, Limited,** of Rutland Works, Sheffield, have received contracts for points and crossings from the following:—Barnsley and District Tramways Company, Preston, Manchester, and Bootle Corporation Tramways.

**Wigan Council** have accepted contracts for installing a new turbine and accessories at the electricity works. Councillor Bickerstaffe mentioned that the Electricity Committee had obtained the very best articles they could get, and they could not bought cheaper without going to Continental makers.

**Sheffield Council** have placed the following contracts:—Brightside Foundry and Engineering Company, engineering work at Holme Lane car depôt, £11,118; Army and Navy Manufacturing Works, Limited, 1,200-1,300 uniform caps, 2s. 9½d. each, and 1,200-1,300 black waterproof covers, 5½d. each; West End Clothiers Company, Limited, 1,200-1,400 pairs of trousers, 12s. per pair, and 350-400 motormen's melton reefers, 22s. 6d. each; R. S. Whitworth, Limited, 600-700 conductors' serge reefers, 20s. 3d. each; British Electric Transformer Company, two 100 k.v.a. testing transformers, £168; Firth, Blakeley, Sons and Co., supply and erection at Neepsend power house of a wrought-steel shoot, £116.

## PERSONAL.

**Mr. H. Hughes,** having been appointed chief clerk to Ashton-under-Lyne Corporation tramways, has resigned his appointment on Walsall tramway staff.

**Councillor J. H. Rodgers,** chairman of the Tramways Committee, was elected an alderman of the Newcastle City Council on November 10 without opposition.

**Alderman R. A. Smithson** has been appointed chairman of Leeds Tramways and Electricity Committee, thus resuming a position he formerly held for more than ten years.

**Mr. L. B. Hogarth,** borough electrical engineer at Morecambe, has been selected for appointment to a similar position at Whitehaven, at a yearly salary of £250. There were 180 applicants.

**Councillor J. H. Hargreaves** has been elected Mayor of Hull. Owing to indifferent health Alderman Robson resigned the chairmanship of the Tramways Committee, and Councillor Hargreaves, the deputy-chairman, was appointed in his place.

**Mr. J. W. Dugdale,** general manager, Oldham tramways, was unable to attend a meeting of the Tramways Committee on November 6. In a letter he stated that he had been unwell and had been attended by a specialist, and was improving a little.

## FINANCIAL REPORTS AND MEETINGS.

**Provincial Tramways Company.**—The directors recommend a final dividend of 1s. per share on the ordinary £1 shares, making a total of 1s. 8d. per share, or 8 1-3 per cent. per annum for the year to September 30. They have also set aside £12,000 for reserve and depreciation and £2,000 as a reserve for third party insurance or for other purposes. £4,440 is to be carried forward.

**The Half-Year at Bournemouth.**—In his half-yearly report, J. Buifin, general manager of the Corporation tramways, shows that the total receipts for the period ending September 30 were £61,034 and the expenditure £32,689, which is an increase on the gross balance for the six months of £2,489, notwithstanding increases of wages and reduction of hours equal to £1,500 a year,

Digitized by Google

and the increased cost of coal and other materials equal to £1,000 per annum. The increased receipts due to Sunday running amounted to £4,214.

**The British Electrical Federation.**—The traffic statement for the week ended November 7, 1913, shows that the receipts from tramways and railways amounted to £39,293, as compared with £36,462 in the corresponding week last year, and from omnibuses £12,193, as compared with £1,262, making a total of £51,486, as compared with £37,724. The tramway and railway route mileage was 428.82, as compared with 428.47. The Federation now have 514 omnibuses, an increase of 422 within the year. Upon such of the services as were working both last year and this year, the receipts show an increase of £2,497 upon the week.

## URBAN DISTRICT COUNCIL OF TEIGNMOUTH.

Tenders are invited for the supply of a Motor Fire Engine.

Particulars may be obtained on application to the undersigned.

Tenders, to be endorsed "Motor Fire Engine," must be delivered to A. Percival Dell, Esqre., Clerk, Town Hall, Teignmouth, on or before November 29, 1913.

The lowest or any tender not necessarily accepted.

F. W. KNIGHT,
Surveyor and Water Engineer.

Town Hall, Teignmouth,
November 10, 1913.

## NORTH-EASTERN RAILWAY.

The directors are prepared to receive tenders for the supply during the six or twelve months from the 1st January, 1914, of the undermentioned articles: 1. Bar Iron. 2. Iron Plates. 3. Steel Plates. 4. Iron Sheets and Hoop Iron. 5. Steel Sheets. 6. Corrugated Iron Sheets. 7. Steel Angles. 8. Mild Steel Bars. 9. Special Steel Bars. 10. Ironwork for Wagons. 11. Metal Castings for Engines. 12. Metal Castings for Carriages and Wagons. 13. Metal Castings for Docks. 14. Metal Castings for Permanent Way. 15. Steel Castings for Permanent Way. 16. Steel Castings (Locomotive). 17. Malleable Castings (Permanent Way). 18. Malleable Castings (Carriage and Wagon). 19. Steel Fish Plates. 20. Cast-iron Chairs. 21. Cast-Iron Point and Crossing Chairs. 22. Cast-Iron Socket Pipes. 23. Gas and Steam Tubes and Fittings. 24. Rain Water Goods. 25. Spring Steel. 25A. Best Cast Steel and Files. 26. Buffer and Bearing Springs for Wagons. 27. Steel Tubes for Locomotives. 28. Brass and Copper Tubes for Locomotives. 29. Copper Pipes. 30. Copper (Bolt). 31. Arc Lamp Carbons. 32. Electric Lamps. 33. Electric Wires and Cables. 34. Electric Lighting, Sundry Fittings. 35. Lead (Pipe and Sheet). 36. White and Red Lead. 37. Linseed Oils (Boiled and Raw). 38. Oils (Paraffin and for Gasmaking). 39. Glass (Sheet and Plate). 40. Glasses (Various). 41. Glasses for Electric Arc Lamps. 42. Shovels. 43. Ropes and Cordage. 44. Tin Plates. 45. Canvas. 46. Brushes. 47. Painters' Brushes. 48. Iron Washers. 49. Nails. 50. Screws (Brass and Iron). 51. Trimming Pins. 52. Cotter Pins. 53. Hinges (Brass and Iron). 54. Steel and Iron Wire Ropes and Cords. 55. Steel and Iron Signal Wire and Signal Cord. 56. Wrought Iron Spikes. 57. Steel Bolts and Nuts. 58. Bolts, Nuts, and Rivets. 59. Cement (best Portland). 60. Concrete and Artificial Stone Flags. 61. Flags (Stone). 62. Stone. 63. Whinstone. 64. Limestone. 65. Slag. 66. Lime. 67. Sanitary Drain Pipes. 68. Common Drain Pipes. 69. Chimney Pots. 70. Oak Trenails. 71. Oak Keys. 72. Oak Cushions. Forms of tender, specification, and conditions may be obtained on application to Mr. E. H. Clark, Stores Superintendent, Gateshead, and tenders must be sent in to the Secretary, at York, sealed and marked "Tender for Stores," not later than 9 a.m. on Tuesday, 25th November. The Directors do not bind themselves to accept the lowest or any tender.

R. F. DUNNELL,
Secretary.

York, November 6, 1913.

## PATENT TIES AND FASTENINGS.

The Proprietors of British Patent No. 26247, of 1909, for "Improvements in and relating to Railway Rail Ties and Rail Fastenings," desire to grant manufacturing licences, or to make other arrangements on reasonable terms for the purpose of working the invention in this country. For further particulars apply MATHYS AND CO., Chartered Patent Agents, 43, Chancery Lane, London, W.C.

## POSITION VACANT.

### ELECTRIC LIGHTING CANVASSER.

Electric Lighting Canvasser wanted immediately for Scotch undertaking. Must be energetic and have some technical knowledge of the business. Wages 35s. and commission.

Address, with reference, No. 520, Keith and Co., Advertising Agents, Edinburgh.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 60 of the principal undertakings of the United Kingdom for the week ended November 8 amounted to £226,144, or £14,445 more than in the corresponding week last year, while the track mileage was 2,862, or 80 more than for the corresponding week. The receipts were at the rate of £79 0s. 3d. per track mile, an increase of £2 17s. 10d. per mile as compared with last year.

## COPPER AND ALUMINIUM MARKET.

November 14, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton:—

**Telephone; No. 2948 GERRARD.**

# WEEKLY LIST OF TENDERS INVITED.

### BOMBAY, BARODA, AND CENTRAL INDIA RAILWAY.

The Directors are prepared to receive, up to noon, on Tuesday, December 9, tenders for the supply of:—

Wheels and Axles and Wheel Centres.

Tenders must be made on forms, copies of which, with specification, can be obtained at these Offices on payment of 20s. each (which will not be returned).

The Directors do not bind themselves to accept the lowest or any tender.

C. CROMMELIN,
Secretary.

Offices: Gloucester House,
110, Bishopsgate, London, E.C.,
November 20, 1913.

### CROWN AGENTS FOR THE COLONIES.

The Crown Agents for the Colonies, acting on behalf of the Government of Nigeria, invite tenders for the supply of Acid Steel Rails, British Standard Section; also Sleepers and Keys for about 100 miles of permanent way at 45lb. per yard, and 40 miles at 60lb. per yard.

Forms of tender and all particulars may be obtained on application at the Office of the Crown Agents for the Colonies, Whitehall Gardens, London, S.W., between the hours of 10 a.m. and 4 p.m. (Saturdays 10 a.m. to 1 p.m.), on payment of a deposit of £1, returnable on receipt of a *bonâ-fide* tender for the whole or part of the supplies required.

Tenders to be delivered in sealed envelopes addressed to the Crown Agents for the Colonies, Whitehall Gardens, S.W., not later than noon on Tuesday, December 16, endorsed "Tender for Rails and Sleepers."

The Crown Agents do not bind themselves to accept the lowest or any tender.

### NORTH EASTERN RAILWAY COMPANY.

STOCKTON TO BILLINGHAM BECK BRANCH RAILWAY.

The Directors are prepared to receive tenders for the Construction of the above Branch Railway, about 3 miles in length, commencing by a junction with the Company's Leeds Northern Railway, near Stockton Station, and terminating by a junction with the Company's Billingham Beck Branch near Billingham Beck. The works comprise a double line railway with about 136,000 cubic yards of earthworks, and bridges, which require about 154 tons of steelwork, beams, etc. Plans may be seen, and specification, detailed quantities, and form of tender obtained on personal application at the office of Mr. C. F. Bengough, the Company's Engineer at York, on and after Monday, the 24th instant. Sealed tenders, marked "Tender for Stockton to Billingham Beck Railway," to be addressed to the Secretary, North Eastern Railway Company, York, not later than 9 a.m. on Monday, December 22, 1913. The Directors do not bind themselves to accept the lowest or any tender.

R. F. DUNNELL,
Secretary.

York, November 18, 1913.

### COUNTY BOROUGH OF WEST HARTLEPOOL.

TRAMWAYS DEPARTMENT.

Tenders are invited for the supply and delivery of the following:—

A. 1. Car Bodies and Trucks.
2. Electrical Equipments for Cars.
B. 3. Points and Crossings.

Specifications, general conditions, and tender forms may be obtained from the undersigned.

Sealed tenders, endorsed (1) "Car Bodies and Trucks," (2) "Electrical Equipments," (3) "Points and Crossings," must be delivered to Higson Simpson, Esq., Town Clerk, West Hartlepool, not later than noon on Wednesday, December 3.

The Corporation do not bind themselves to accept the lowest or any tender.

CHAS. BURGESS,
General Manager and Engineer.

Tramway Depôt,
Greenland, West Hartlepool,
November 19, 1913.

### SEVENOAKS URBAN DISTRICT COUNCIL.

TO MOTOR ENGINEERS.

The Urban District Council of Sevenoaks hereby invite tenders for the supply of

(a) A Motor (about 30 horse-power) Hose Cart, to carry 6 men, hose, and appliances, and
(b) A Petrol Motor Fire Engine fitted with Pumps of 150 and/or 200 gallons capacity, 30 feet of Telescopic Ladders, 40 feet of Suction Hose, and the usual accessories, rendering the Machine ready for immediate use.

No specification will be issued, but makers are to supply their own in full detail.

Tenders to be addressed to the "Chairman of the Special Fire Committee," Council Offices, Argyle Road, Sevenoaks, and to be delivered by 12 noon on the 28th day of November, 1913.

Neither the lowest nor any tender will necessarily be accepted.

By order, F. W. TIPTON,
Clerk of the Council.

November 15, 1913.

### METROPOLITAN BOROUGH OF SHOREDITCH.

ELECTRICITY DEPARTMENT.

The Council of the Metropolitan Borough of Shoreditch are prepared to receive tenders for the following:—

Sub-Station Plant, comprising Transforming and Converting Plant, together with the necessary starting and controlling apparatus and connections.

General conditions, specification, drawings, form of tender, and form of agreement may be obtained from the undersigned on and after the 20th day of November, 1913, on making a deposit of five guineas, which sum will be refunded to *bonâ-fide* tenderers after the tenders have been adjudicated upon, provided that such tender has been duly delivered in the manner described below, and shall not have been withdrawn. Extra copies of the specification may be obtained by *bonâ-fide* tenderers at a charge of one guinea per copy, which sum will not be refunded.

Tenders must be placed in envelopes endorsed "Tender for Electricity Works," and sealed with sealing wax, and must be delivered by the persons tendering or their authorised representative to the Town Clerk, Town Hall, Old Street, Shoreditch, London, N., not later than noon on Tuesday, December 16, 1913.

The Council do not bind themselves to accept the lowest or any tender, or to proceed with the work unless they are able to obtain from the London County Council sanction to the necessary loans upon terms which may be acceptable to the Shoreditch Borough Council.

C. NEWTON RUSSELL.

Shoreditch Electricity Dept.,
Coronet Street, Shoreditch, N.

## CITY OF NOTTINGHAM.

The Tramways Committee are prepared to receive tenders for the supply and delivery of .—

(1) 750 Tons of Steel Tramway Rails.
(2) 21 Tons of Steel Tie-Bars.
(3) Steel Tramway Poles.
(4) Cast Iron Pole Fittings.
(5) Malleable and Wrought Iron Pole Fittings.

Drawings may be seen, and copies of the specifications and forms of tender obtained on applying to Mr. Arthur Brown, M.Inst.C.E., City Engineer, Guildhall, Nottingham, on payment of a deposit of one guinea in each case, which will be returned on receipt of a *bonâ-fide* tender and the copy of the specification.

Sealed tenders, in the official envelopes provided, are to be delivered to the undersigned not later than Monday, December 1, 1913.

The lowest or any tender will not necessarily be accepted, and the Committee reserve to themselves the right to divide the work.

Tenders will only be accepted from firms who conform to the conditions of the contract as regards paying the local standard rate of wages, etc.

By order, W. J. BOARD,
Town Clerk.

Guildhall, Nottingham,
November 18, 1913.

## BOROUGH OF SOUTHEND-ON-SEA.

TO CONSTRUCTIONAL ENGINEERS AND CONTRACTORS.

PIER TRAMWAY.

The Corporation of Southend-on-Sea is prepared to receive tenders for the supply and erection of Castiron Piles, Compound Girders, Joists, and incidental Works and Materials required in connection with the Extension of a Tramway Passing Place, and the Provision of a New Siding, on Southend-on-Sea Promenade Pier.

Plans may be inspected, and specification, bill of quantities, and form of tender obtained, on application to the Borough Engineer, Mr. Ernest J. Elford, M.Inst.C.E., on and after Thursday, November 20, on payment of a deposit of two guineas, which will be refunded on receipt of a *bonâ-fide* tender on the form supplied, and the return of all documents.

Sealed tenders, endorsed "Pier Tramways," and addressed to the undersigned, must be delivered by 9 a.m. Thursday, December 4.

The Corporation do not bind themselves to accept the lowest or any tender.

By Order, H. J. WORWOOD,
Town Clerk.

Town Clerk's Office, Southend-on-Sea,
November 17, 1913.

## BURGH OF LEITH.

TRAMWAYS EMPLOYEES' UNIFORMS.

The Town Council invite tenders for the supply of Summer Uniforms, Factory or Tailor made, as may be determined—conform to sample cloth and suits, to be seen at the Tramways Offices, 165, Leith Walk, and to relative conditions of contract.

Particulars may be obtained from the Tramways Manager there.

Tenders (endorsed "Tramways Uniforms"), with separate sample of cloth, marked with a private mark which shall not be recognisable until the tenders are opened, must be lodged with me not later than December 15 next.

The lowest or any tender may not necessarily be accepted.

D. ROBERTSON,
Town Clerk.

Town Clerk's Office, Leith,
November 19, 1913.

## FARE QUESTIONS.

Less attention than usual was bestowed during the municipal elections upon tramway questions. In part this may have been due to the fact that in the cases of several of the largest undertakings matters relating to concessions were already under consideration, and reports may shortly be expected dealing with the increase of penny distances and an extension of the period during which workmen's tickets are issued. These are matters that cannot well be avoided on systems where prosperity is increasing year after year, with the result that larger sums are allocated to the relief of the rates. Another factor that has doubtless forwarded these proposals is the reduction of fares in London under the stress of omnibus competition, although similar concessions have not yet been granted by the owners of the latter vehicles. No provincial tramway, however, has followed the example of the London County Council in issuing return tickets after the workmen's car hours. This is a matter to which attention might well be devoted, in view of the convenience thereby conferred upon the passengers. The conductors, too, are enabled to get through their work on the return cars with less trouble, though it must be admitted that they have to carry a larger stock of tickets and are detained longer at the depôts for the checking of their accounts unless a larger staff of checkers are employed. At Birmingham the Committee have under consideration a memorial in favour of halfpenny fares, and, by direction of the Corporation, they are also deliberating upon a proposal for issuing workmen's tickets up to 8.30 a.m. instead of to 8 o'clock. At a meeting at Aston, where the chairman of the Tramways Committee addressed the ratepayers, a resolution was carried in favour of penny return tickets for half stages and for the issue of transfer tickets. To the demand for halfpenny fares Mr. Harrison Barrow replied that he believed halfpenny fares would result in a loss, but he admitted that a trial would be necessary to prove such contention. Mr. Barrow is a little inaccurate, however, in stating that no large cities in this country have adopted transfers. A number of cases might be cited, notably that of London, where return transfer tickets are also issued. The halfpenny fare question has also been under consideration at Salford, where a previous trial proved unsuccessful. The Tramways Committee have agreed to recommend that no halfpenny fares be granted, except on the shorter routes, where a penny return fare will be instituted, instead of making the single journey a halfpenny fare. It is intended to fix the maximum fare at a penny on all routes in the borough, so that passengers from Deansgate to Kersal Bar, who now pay a three-halfpenny fare, will be able to travel for a penny. A somewhat preposterous suggestion has been submitted to the Bury Tramways Committee. It is to the effect that the time during which workmen's tickets are available should be extended for the benefit of people who work overtime. The manager is engaged in obtaining information on the subject from other towns. At Glasgow the Socialist element utilised the elections for agitating in favour of further concessions now that the extension of the halfpenny stages has not brought about any great diminution of the annual balance. Notwithstanding that the Socialists' scheme for utilising the surplus for the erection of municipal cottages has been rejected, they are reported to be concentrating upon an attempt to earmark future surpluses for that purpose.

## BREAKDOWNS AND STREET OBSTRUCTION.

The by-law adopted by London County Council on Tuesday last in regard to obstruction of traffic caused by the breakdown of vehicles in the streets should result in much advantage to the working of metropolitan tramways. Local authorities have powers under section 23 of the Municipal Corporations Act, 1882, and section 16 of the Local Government Act, 1888, to make by-laws dealing with such obstruction. The decision of the County Council to approve a by-law of the kind is an example of the way in which some needed reforms can be carried out without new legislation, and also of the fact that some of the proposals put forward by the recent Select Committee of the House of Commons on motor traffic can be given effect to by administration. That Committee in their report stated that they regarded the presence in crowded streets of vehicles that were structurally unsound as a serious menace to public safety, and they considered it desirable that a by-law should be framed imposing penalties on any owner or driver who knowingly sent or took an unsound vehicle into the streets. The Local Government Committee of the Council apparently lost no time in directing their attention to this matter, and they entered into communication with the Home Secretary on the subject. After negotiations with him the terms of a by-law were adjusted, giving effect to the proposal of the Parliamentary Select Committee, and as it has been adopted by the Council it will presumably come into force immediately. The maximum penalty provided is 40s., and there is a saving clause to the effect that no person shall be convicted if he satisfies the Court that he had taken all reasonable means to maintain the vehicle in proper condition or to prevent its being over-

Digitized by Google

loaded, or in the case of the driver that he was unaware of its defective or overloaded condition. The penalty clause applies to overloaded vehicles which break down as well as to those in a defective condition. The evil arising from the breakdown of vehicles on streets within the Metropolitan police district is much more acute than it is in any other town in the country. The tramway authority in any place outside of London freely exercises the power of immediately removing vehicles broken down on the tramway tracks to the sides of the roads, so that the tramway traffic may suffer the least possible interruption. In some of the larger towns, in fact, there is what may be called a breakdown gang organised on fire brigade principles so far as regards speed and being on the spot in the least possible time. But in London the Commissioner of Police has strong objections to the tramway authority moving a broken-down vehicle until it has been inspected by a police officer sent for the purpose. This, it is said, has sometimes caused a delay of an hour or more. It is to be expected that the liability of a penalty will discourage the sending out of defective vehicles, and what is perhaps even a more practical consequence, the sending out of vehicles with such loads that they break down. No doubt the enforcement of the by-law will sometimes lead to prolonged hearings before the magistrates. It will, for instance, be possible for the owner of the vehicle to allege that the breakdown was caused by a tramway rail being above or below the level of the adjacent paving, or to plead that the vehicle was not in a defective state before the breakdown occurred. In the case of alleged overloading the question as to what load a vehicle could safely carry, and as to what the actual weight of the load was at the time when the breakdown occurred, will have to be determined by evidence. Nevertheless, there can be no doubt that the working of the by-law will be beneficial, both to the tramway undertaking and to general street traffic.

## ELECTRIC TRACTION AND OMNIBUS BILLS FOR 1914.

The following are abstracts of the Parliamentary notices of some of the private Bills for next session relating to tramways, electric railways, and omnibuses. The notices may be published at any time before the end of this month, so that a good many others will probably fall for inclusion in our next issue.

BIRKENHEAD CORPORATION.—To enable the Corporation to run motor omnibuses in the borough and in neighbouring districts, and to acquire lands and erect buildings and shelters for the purpose. Solicitor—James Fearnley, town clerk, Birkenhead. Parliamentary agents—Sherwood and Co., 22, Abingdon Street, Westminster.

BRISTOL CORPORATION (TRAMWAYS).—To empower the Corporation to work any tramways within or outside the city of Bristol which they may hereafter acquire or construct or which may be leased to them, and to enter into agreements with the Bristol Tramways and Carriage Company or other body for purchase, leasing, or working by the Corporation of tramways whether the tramways are compulsorily purchasable by the Corporation or not. Solicitor—E. J. Taylor, town clerk, Bristol. Parliamentary agents—Dyson and Co., Caxton House, Westminster.

CENTRAL LONDON RAILWAY.—To authorise the company to enlarge their tunnels under Holborn, to make subways at Shepherd's Bush, Oxford Circus, and the Bank of England, to acquire lands, to raise additional capital, and to issue warrants to bearer. Solicitors—Ashurst, Morris, Crisp and Co., 17, Throgmorton Avenue, E.C. Parliamentary agents—Sherwood and Co., 22, Abingdon Street, Westminster.

CLECKHEATON URBAN DISTRICT COUNCIL.—*Inter alia* to enable the Council to run motor omnibuses within the district and outside of it on two routes to connect with termini of the Yorkshire (Heavy Woollen District) Tramways at Liversedge and Gomersal. Solicitors—J. H. Linfield, clerk to the Council, and Clough and Crabtree, Cleckheaton. Parliamentary agents—Torr, Durnford and Co., 2, Millbank House, Westminster.

GLASGOW CORPORATION (WATER, TRAMWAYS, ETC.)—To authorise the Corporation, among other things, to construct numerous additional tramways, largely consisting of suburban extensions and including lines extending as far as Milngavie and Coatbridge, to give to the Corporation running powers over part of the lines of the Airdrie and Coatbridge Tramways Company, to authorise new streets and street improvements, and to enable the Corporation to run omnibuses. The total length of tramways proposed is 21 miles 30 chains, practically all double track. Solicitor—J. Lindsay, town clerk, Glasgow. Parliamentary agents—Martin and Co., 27, Abingdon Street, Westminster.

LONDON COUNTY COUNCIL (TRAMWAYS AND IMPROVEMENTS).—To enable the Council to construct four lengths of tramways, including Charles Street to Ludgate Circus, Aldgate to near Mark Lane, Aldgate terminus to Aldgate station, and Lee Green to Eltham; to widen streets, to acquire lands, and to provide for the working by the Council of certain portions of tramways recently acquired or about to be acquired. Solicitor—Laurence Gomme, clerk of the Council, County Hall, Spring Gardens, S.W. Parliamentary agents—Sherwood and Co., 22, Abingdon Street, Westminster.

LONDON ELECTRIC RAILWAY.—To authorise the company to construct subways at Tottenham Court Road, Piccadilly Circus, and Trafalgar Square, to acquire lands, to raise additional capital, to increase the rate of interest on unissued preference stock, and to issue stock certificates to bearer. Solicitors and Parliamentary agents—Bircham and Co., 46, Parliament Street, Westminster.

LONDON UNITED TRAMWAYS.—To empower the company and any other company or any local authority owning or working tramways to enter into agreements with regard to the leasing, working and maintenance of the tramways or light railways of the contracting parties, the interchange of traffic, the supply of rolling stock and motive power and the apportionment of tolls; to authorise through tickets and bookings, and the postponement of the time of purchase of tramways, to enable any local authority to lease tramways to the company, to enable the company to carry excess passengers in the cars, and to run coupled and trailer cars, reserved cars and cars for special purposes. Solicitors—Stanley, Washbrough, Doggett and Baker, St. Stephen's House, Westminster. Parliamentary agents—Dyson and Co., Caxton House, Westminster.

MIDDLESEX COUNTY COUNCIL (WESTERN ROAD AND IMPROVEMENTS AND FINANCE).—To authorise the Council to make a new roadway from a junction in the parish of Heston with the Bath Road to a junction with High Road, Chiswick, a widening of Syon Lane in the parish of Isleworth, and a new road in that parish from a junction with Syon Lane to the junction of London Road with Twickenham Road at Busch Corner. It is also proposed to acquire lands and buildings, to prohibit the use of the new roads for the purpose of tramway, light railway, trolley vehicle, motor and other omnibus service and to provide that no application shall be made for powers to work any such service or to construct any tramway or light railway on the new roads except with the consent of the Council, and to empower and if thought fit to require the Brentford and Heston and Isleworth Urban District Councils to construct and maintain or to contribute to the cost of construction and maintenance of the new roads or parts of them. Solicitor—E. S. Ficeland, 46, Queen Anne's Gate, Westminster. Parliamentary agents—Sherwood and Co., 22, Abingdon Street, Westminster.

NEWPORT CORPORATION.—To authorise the Corporation among other things to construct additional tramways, to build a new bridge across the River Usk, and to run motor omnibuses within and beyond the borough. Solicitor—A. A. Newman, town clerk, Newport (Mon.). Parliamentary agents—Rees and Freres, 5, Victoria Street, Westminster.

## L.C.C. TRAMWAY MATTERS.

BREAKDOWN OF ROAD VEHICLES.

At last Tuesday's meeting of the London County Council the Local Government, Records, and Museums Committee reported that they had been considering the advisability of the Council making a by-law under section 23 of the Municipal Corporations Act, 1882, and section 16 of the Local Government Act, 1888, dealing with obstruction to traffic caused by the breakdown of vehicles. The House of Commons Committee on Motor Traffic in their report recently issued stated that they regarded the presence in crowded streets of vehicles that were structurally unsound as a serious menace to public safety, and they considered it desirable that a by-law should be framed imposing penalties on any owner or driver who knowingly sent or took an unsound vehicle into the streets. The Local Government Committee now recommended the adoption of a by-law for the county of London which they understood the Home Secretary would be prepared to allow. The by-law provided that in any case where a vehicle breaks down and causes obstruction to traffic, and the breakdown is due to the defective condition of the vehicle or to its being overloaded, the owner or any other person who caused or permitted it to be used and the driver shall be guilty of an offence, and shall be liable to a penalty not exceeding 40s. A provision is added that no person shall be convicted if he satisfies the Court that he had taken all reasonable means to put and maintain the vehicle in proper condition or to prevent its being overloaded, or, being the driver, that he was unaware of its defective or overloaded condition.

The report was adopted without discussion.

A COSTLY STREET WIDENING.

The Improvement Committee submitted a report of a scheme for the widening of High Street, Wandsworth, and East Hill in connection with the construction of a tramway from York Road to East Hill. It was proposed that the widening of the streets should be carried out in sections as properties for the purpose were acquired. The total estimated cost for the widenings and the property was £73,000, and it was recommended that the improvement should be undertaken at an early date. The Wandsworth

Digitized by Google

Borough Council had agreed to contribute one-third of the net cost. The Finance Committee mentioned that the County Council's share of the net cost would be £45,667, involving yearly debt charges amounting at their maximum to £2,700, and decreasing by £31 a year. Consideration of the matter was adjourned.

MOTOR CARS FOR THE TRAMWAY DEPARTMENT.

The Highways Committee reported that the following tenders had been received for the supply of six motor cars required for use in the tramway department, and for the purchase of the six cars now used :—

| | With non-detachable wheels. | With detachable wheels. | Price offered for the six cars at present in use |
|---|---|---|---|
| | £ s. | £ | £ |
| Enfield Autocar Co. .. .. | 1,986 0 | 1,986 | 210 |
| Singer Motor Co. .. .. | —— | 2,538 | 240 |
| Austin Motor Co. .. .. | 2,649 15 | 2,748 | 225 |
| Wolseley Tool & Motor Car Co. | 2,718 0 | 2,706 | 60 |

The estimate of the chief officer was £2,000. The Highways Committee proposed that the Council should accept the tender of the Enfield Autocar Company, and this was agreed to.

INCREASE OF WAGES.

The Highways Committee reported that the Rolling Stock Conciliation Board had considered an application for an increase of 1d. an hour in wages by fitters, turners, millwrights, toolmakers, slotters, planers, blacksmiths, hammermen, and the various classes of machine makers employed in the tramway department. An agreement was arrived at by the Board the effect of which was that the men of each grade should receive an increase of ½d. per hour, with a further increase of ½d. an hour to take effect a year later. The agreement was to remain in force for two years. Additional expenditure of £400 would be incurred in respect of the remainder of the current financial year, while the increased expenditure during 1914-15 would be £1,900, and during 1915-16 and each subsequent year on the present establishment, £2,831.

The Rolling Stock Conciliation Board had also considered applications as to increase of pay of car washers, and grading and rates of pay of controlier repairers and light and power attendants in the tramway department. The car washers had applied for an increase of 3s. a week, the present rate of pay being from 27s. 6d. to 30s. a week. The controller repairers were paid 7d. to 8d. an hour, and light and power attendants 7d. an hour, and they had asked for a flat rate of 8d. an hour. Last March the Council had approved an agreement under which those employees were to be graded as traction wiremen, and were to be paid 8d. an hour. It was not, however, found possible to give effect to this arrangement. The Conciliation Board considered these matters on October 29 last, and an agreement on all points was arrived at. Its effect was that regular washers were to be paid 30s. a week. There were 554 men already in receipt of this rate, and some of those had received it for twelve months or more. It was proposed that these employees should be paid an extra 1s. a week, such extra payment to be personal to such employees. With regard to the controller repairers and light and power attendants, it was proposed that they should be paid 8d. an hour, and continue to be designated as at present. The agreement would involve additional expenditure of £1,062 during the remainder of the current financial year, and increased expenditure of £3,070 during 1914-15 and each subsequent year.

The Committee pointed out that the rate of pay of plumbers in the building trades was increased from 11d. to 11½d. an hour on September 22 last and increased to 1s. an hour on October 27. The Committee understood that it was the custom for plumbers and plumber jointers (electrical trades) to be paid the same rate, and they accordingly proposed that the rate of pay of the plumber jointers in the tramway department should be increased from 11d. to 1s. an hour. The arrangements thus made by the Committee were approved.

THE USE OF TRAMWAY SHELTERS.

Replying to Mr. J. D. Gilbert, Mr. G. H. Hume, vice-chairman of the Highways Committee, said that the Committee had come to the conclusion that no further action should be taken in regard to the proposed tramway shelter at Kennington Gate. The service of cars here was so frequent that there was little or no waiting. The services of the motor 'buses were less frequent, and the shelter would probably be used by 'bus passengers. It was also found that in wet weather the shelters were used by pedestrians, and it was not reasonable to provide such public accommodation out of the tramways account.

APPLICATION FOR MORE TRAILER CARS.

Mr. Hume, in reply to a question, said that there were eight trailer cars in use in London, and the Committee were most anxious to get the sanction of the Board of Trade to a larger number. The Board were now being approached.

---

**Dundee Tramwaymen and Indigestion.**—In connection with the trial of the new relief duties now being made at Dundee, the car employees on November 14 sent a deputation to place their complaints before the Tramways Committee. The deputation admitted that the spread-over time had been curtailed, but said their day was more broken up than it had been. Their meal times were shortened. The night men were particularly hard hit. It was asserted that indigestion had become prevalent owing to the irregular meal hours. The committee agreed that three representatives of the men should be asked to meet the manager and the chairman of the committee, to draw up a time table to meet the wishes of the men. An estimate will then be presented of the cost of carrying it out.

## TRAMWAY CHAIRMEN FOR 1913-14.

The reorganisation of the Town Councils after the annual November elections is now being completed. In the great majority of cases the chairmen and vice-chairmen of the various Tramway Committees have been re-appointed for the ensuing year, as will be seen from the following list which is continued from last week.

| Town. | Chairman. | Vice-Chairman |
|---|---|---|
| Barking .. .. | Councillor A. E. Martin .. | —— |
| Bexley .. .. | Councillor T. Rattenbury .. | —— |
| Blackpool .. .. | Alderman Brodie .. .. | Councillor Holt. |
| Bolton .. .. | Alderman J. Miles .. .. | *Councillor P. Higson. |
| Bootle .. .. | Councillor Booth .. .. | Councillor Pennington. |
| Burnley .. .. | Councillor E. Heap .. .. | Councillor Irving |
| Bury .. .. | Alderman T. S. Collinge .. | Councillor Hargreaves. |
| Cardiff .. .. | Alderman Sir J. W. Courtis .. | *Councillor A. J. A. Stone. |
| Colchester .. .. | Councillor A. M. Jarmin .. | Councillor J. T. Bailey. |
| Croydon .. .. | *Alderman Allen .. .. .. | Councillor Pelton. |
| Darwen .. .. | Alderman J. Tomlinson .. | Councillor G. P. Holden. |
| Devonport .. .. | Alderman J. C. Tozer .. .. | Councillor J. F. Cole. |
| Douglas .. .. | *Councillor J. Kelly .. .. | —— |
| Edinburgh .. .. | Councillor J. Harrison .. .. | —— |
| Erith .. .. | Councillor G. C. Humphreys .. | —— |
| Exeter .. .. | *Councillor T. Linscott .. .. | *Alderman H. B. Varwell. |
| Farnworth .. .. | Councillor W. B. Richardson .. | —— |
| Glasgow .. .. | Councillor R. Kirkland .. | Councillor Jas. Alston. |
| Gloucester .. .. | *Councillor J. O. Roberts .. | *Councillor C. J. Ramstedt. |
| Haslingden .. .. | Councillor Waddington .. | *Councillor Haworth. |
| Heywood .. .. | Councillor J. Ashworth .. | Alderman T. Popple. |
| Huddersfield .. .. | Alderman J. H. Aston .. | *Councillor J. Barlow. |
| Hull .. .. | Counc. J. H. Hargreaves (Mayor) | Councillor W. Wheatley. |
| Ilford .. .. | Councillor R. Stroud .. .. | Councillor J. Deveson. |
| Kilmarnock .. .. | Councillor Finlay .. .. | —— |
| Kirkcaldy .. .. | Councillor Fergusson .. .. | —— |
| Lancaster .. .. | Councillor Wilkinson .. .. | —— |
| Leith .. .. | Judge Hall .. .. .. | —— |
| Leyton .. .. | Councillor H. Heather .. .. | —— |
| Lincoln .. .. | Alderman W. S. White .. | Councillor M. A. Ashley. |
| Liverpool .. .. | Alderman F. Smith .. .. | Major R. J. Clarke. |
| Lowestoft .. .. | Councillor F. Spashett .. .. | —— |
| Luton .. .. | Alderman Wilkinson .. .. | —— |
| Maidstone .. .. | Councillor Lyle .. .. .. | Councillor Green. |
| Manchester .. .. | Alderman J. Bowes .. .. | Councillor A. W. Chapman |
| Nelson .. .. | Councillor W. F. Cooke .. | —— |
| Newcastle .. .. | Alderman J. H. Rodgers .. | Councillor R. Mayne. |
| Northampton .. .. | Councillor T. D. Lewis .. | Councillor W. Beale. |
| Nottingham .. .. | Councillor R. H. Swain .. | Alderman F. R. Radford. |
| Perth .. .. | *Councillor Calderwood .. .. | —— |
| Portsmouth .. .. | Alderman J. H. Corke (Mayor) | Councillor J. Timpson. |
| Preston .. .. | *Alderman J. Ormrod .. .. | *Councillor T. Parkinson. |
| Radcliffe .. .. | Councillor Walker Allen .. | —— |
| Rawtenstall .. .. | Alderman H. Coupe .. .. | *Councillor J. W. Stansfield |
| Reading .. .. | Alderman C. G. Field (Mayor) | —— |
| Rochdale .. .. | *Alderman Taylor .. .. | —— |
| Rotherham .. .. | Alderman D. L. Winter .. | Councillor T. Reeves. |
| Southampton .. .. | Alderman F. A. Dunsford .. | —— |
| South Shields .. .. | Alderman W. G. Wylie .. | Alderman J. W. Henderson (Deputy Mayor). |
| Stockport .. .. | Alderman C. Sharples .. .. | Alderman W. E. Hammett. |
| Sunderland .. .. | Councillor G. New .. .. | Councillor W. Walker. |
| Wallasey .. .. | Alderman J. Farley .. .. | Councillor W. Eastwood. |
| Walsall .. .. | Alderman J. Cope .. .. | Alderman J. Williams. |
| Walthamstow .. .. | *Councillor E. Samuels .. .. | —— |
| Warrington .. .. | *Councillor Dr. G. W. Joseph .. | Councillor J. Wilkinson. |
| Wigan .. .. | *Councillor R. Fletcher .. .. | *Councillor J. Walkden. |
| York .. .. | Alderman S. W. Meyer .. | Councillor S. H. Davis. |

*Denotes a change in the chairmanship or vice-chairmanship.

## MISCELLANEOUS NEWS AND NOTES.

**Enlargement of a Leeds Depot.**—The Beckett Street tramways depôt is to be enlarged at a cost of £7,500.

**Railless Trolley Traction for Japan.**—A company is being formed at Tokio to introduce railless trolley car services in six of the principal towns of Japan.

**Fire Alarms on Tramway Standards.**—Southampton Tramways Committee have refused to allow the Fire Brigade Committee to use the tramway standards for carrying wires for fire alarms.

**More Railless Cars for Ramsbottom.**—The Town Council have agreed to the Tramways Committee obtaining two additional cars for the railless trolley service. A sub-committee will visit the works of the various makers.

**Railless Traction and Motor Omnibuses for Launceston.**—The City Council of Launceston (Tasmania) have adopted a scheme providing for the running of railless trolley and motor omnibus services, and for the borrowing of £30,000 for tramway purposes.

**Responsibility for Track Maintenance.**—As the result of a discussion on the question whether the general manager's department or the city surveyor is responsible for the maintenance of the tramway track the Belfast Tramways Committee have requested Mr. Nance to obtain information as to the procedure adopted by other municipalities.

**Double-Deck Trolley Car Sanctioned.**—A double-deck trolley car, similar in appearance to an omnibus but having two trolley arms on top, has been sanctioned by the Board of Trade for use on the through railless trolley system to be installed in Brighton and Hove. The car was constructed by the Brush Company, accommodates 34 passengers, and weighs just under four tons unloaded.

**Offer of Omnibuses to Oxford.**—The National Electric Construction Company have made an offer to drop the tramway electrification proposals and to substitute a motor omnibus service, paying the Corporation £500 a year as rent. In return they ask the Council to pay £20,000 for the existing horse tramways, excluding horses, cars, etc., the rails to be taken up. The Tramways Committee have recommended the acceptance of the offer, provided the company pay £800 a year rent, the sum payable by the Corporation to be reduced to £15,000. The General Purposes Committee have decided against the recommendation.

**Messrs. Watlington and Company, Limited,** of Britannia House, Milton Street, London, E.C., notify that their telephone number has been altered to City 1257 (2 lines).

**Reduction in London Tramway Assessment.**—The rateable value of the London County Council tramways lines in the borough of Deptford has been reduced from £12,263 to £2,250 in consequence of the falling off in the receipts of the tramways, attributed, among other things, to omnibus competition.

**Dinner Hour Fares.**—Colchester Council has agreed to allow workmen at Hythe to travel at workmen's fares during the one o'clock dinner hour between Hythe terminus and Osborne Street, the return fare being one penny. The Tramways Committee have permitted return tickets on the North Hill and Recreation Ground routes to be likewise available on the Hythe route between North Hill and Wimpole Road, and *vice versâ*.

**Brighton Councillors and Free Passes.**—In view of the equal voting at a meeting of the Town Council on the subject of free tramway passes being granted to members, a petition was signed in favour of the committee again considering the matter. The committee have informed the memorialists that they do not deem it advisable to comply with the suggestion that each member of the Council should be supplied with a free pass.

**Trail Cars Suggested for Derby.**—In reply to questions at a meeting of the Council on November 13, Councillor Dean, deputy chairman of the Tramways Committee, said that with the assistance of the manager of the tramways, the committee were preparing a revised scale of fares. They were negotiating for wind screens, whilst boxes were to be put on the cars for the tickets of passengers as they were leaving. He did not think they would run longer cars, but they might run trailer cars.

**Platform Screens at Birkenhead.**—A wind screen, partly of glass and partly of celluloid, which folds up easily and can be let down by means of a catch, is being experimented with on the Birkenhead tramcars. There appears to be a divided opinion among the motormen as to the merits of the appliance.

**Warnings Against Unguarded Hatpins.**—In consequence of a painful accident which has occurred amongst a number of women who were shopping in a Manchester street, the Tramways Committee have decided that notices calling attention to the dangers of unprotected hatpins, both to passengers and conductors, should again be placed in the tramcars. Since notices were last displayed the inspectors have reported from time to time that the womenfolk were becoming more careful in the matter.

**Litigation Concerning Current Supply.**—December 9 is the date fixed for the trial of a motion by Sunderland District Electric Tramways, Limited, to restrain the Newcastle-upon-Tyne Electric Supply Company and the County of Durham Electric Power Supply Company from cutting off plaintiff company's supply of electric power, and so stopping the running of their tramcars. It appears that there is a dispute as to the price.

**Railless Trolley Cars for a Newcastle Bridge.**—The North Eastern Railway Company propose to apply for powers to run trolley cars in Newcastle and Gateshead in order to run a car service across the high-level bridge, the powers being needed for the alighting stations at either end of the bridge. For a number of years private companies have run omnibuses across the bridge, and some time ago the railway company failed in a legal action to compel these 'bus proprietors to pay ½d. per passenger carried, it being held that the toll of 4d. per vehicle was the only legal charge.

**Efficiency of Life-Guards.**—It was stated at an inquest held at Bradford on a man who was killed while attempting to cross the road between two tramcars, that the last fatal accident to a passenger occurred on September 28, 1912. Since that date 67 people had been knocked down, 41 had fallen clear of the track, and 26 had been picked up safely by the life-guard. The Corporation had the most up-to-date invention in life-guards. Since 1898 a total of 550 million passengers had been carried, and there had only been two fatal accidents to passengers. In 1911 there was one fatal accident to a pedestrian, but none in 1912 or 1913.

**Lowestoft Chairman's Interesting Question.**—Councillor Spashett, chairman of the Tramways Committee, at a meeting of Lowestoft Council on November 13, asked the Town Clerk whether they could set aside some sum for depreciation, although they were not making a profit. They were setting nothing aside. The Town Clerk said it was a question that required consideration. Councillor Spashett: But I want to know, because I do not think we are in a position to set anything aside. Councillor A. B. Capps asked whether the fact of repaying capital did not allow for depreciation? The Town Clerk said that no doubt met depreciation to some extent, but it was not a sufficient amount to replace the wear and tear, and it was a matter that required a good deal of consideration. The question was one on which he did not like to give an unconsidered reply.

**Ilford and Inter-Running.**—Ilford Urban Council were recommended by the Tramways Committee to enter into a three years' agreement with East Ham Corporation for 5½d. instead of 6d. per car mile run on the Ilford Council's Ilford Hill section. Councillor Waters moved to refer the paragraph back "in order that negotiations may be entered into with neighbouring authorities to arrange a system of inter-running financially satisfactory to all parties." The recommendation was adopted, subject to the clerk so framing it that the three years' agreement should terminate whenever arrangements could be made for inter-running. The Ilford Council's tramways, which have through running with London, are now showing considerable increases in the receipts as compared with the same weeks last year, although the omnibus competition is as keen as ever.

**Edison Accumulators, Limited,** exhibited at the Motor Show at Olympia, on the stand of Messrs. Arrol-Johnston, a three-passenger Edison accumulator car, and they also had a number of similar vehicles outside for purposes of demonstration. The company's vehicles are attracting increasing attention, owing to the excellent results obtained from those in service. Among users are Messrs. Liberty, who have recently ordered two more vans. This firm has proved the advantages of the accumulator car. Messrs. Pullars have placed an order for a one-ton van for use in the London area. The Stratford Co-operative Society have also ordered a car, and it will be recalled that only recently the Ilford Borough Council placed an order for a tower wagon for use in their tramways and lighting department. The Edison Company are now established at their new offices, which include the whole of the building Nos. 2 and 3, Duke Street, and No. 1, King Street, St. James Street, W. The premises will be known as the Edison Building.

**Insurance Companies and Damage to Generating Stations.**—Mr. J. E. Teasdel, engineer and general manager of Pontypridd tramways, has reported to the Tramways Committee that the recent tornado caused considerable damage to the electrical works. He made a claim against the insurance company, and while he could not show any fire or scorching resulting from the effects of electrical disturbance, he had evidence which should go to prove that lightning played a very prominent part. The Clerk added that the company would not admit that the damage was caused by lightning, but contended that it was due to a wind storm. He understood that all the insurance companies, after considering the reports of the assessors, had decided to adopt that attitude.

**Progress at Newcastle.**—Alderman Rodgers has presented to the Corporation the appended comparative return of tramways traffic from April 1 to November 1:—

| | Receipts. | Passengers. | Miles. | Average per car mile. |
|---|---|---|---|---|
| 1913 .. .. | £150,909 14 1½ | .. 33,405,022 | .. 3,100,388 | .. 11.62 |
| 1912 .. .. | 135,708 3 6½ | .. 29,851,017 | .. 2,755,602 | .. 11.82 |
| 1911 .. .. | 132,679 18 2 | .. 28,842,065 | .. 2,688,386 | .. 11.84 |

A report of the Tramways Committee, recommending an increase of 1s. per week in the wages of motormen and conductors has been adopted.

## CONTRACTS AND ORDERS.

**E. Bennis and Co., Limited,** have received a repeat order from Barnsley Council for four mechanical stokers and self-cleaning compressed air furnaces.

**London County Council** have accepted the following tenders:—G. Hayward, 80 movable platforms for car-washers at Cressy Road car shed and 36 such platforms for use at Camberwell car shed extension, £7 each; Enfield Autocar Company, Birmingham, six motor cars for the tramway department, £1,986; Dennis Brothers, motor lorry for use by the fire brigade, £615.

**London and South Western Railway Electrical Scheme.**—Messrs. Scholey and Company Limited have received an order for their special tool steel gears and pinions from the British Westinghouse Company for the whole of the equipments required in the electrification of the suburban lines of the London and South Western Railway. This constitutes the largest single order ever placed in this country for gears and pinions.

**Tilling-Stevens Omnibuses for Johannesburg.**—An order has been given by the Johannesburg Council for four more Tilling-Stevens petrol-electric omnibuses. For the bodies local tenders have been invited in order that local experience may be utilised to secure a body suitable to the climate. The decision to purchase the vehicles was arrived at on the recommendation of the tramways manager after the experience of the running of a petrol-electric and another type of machine purchased in March last.

## PERSONAL.

**The Late Mr. T. Frame Thomson,** a director of several South American tramway companies, has left estate valued at £47,183 net.

**Mr. George Balfour,** of Messrs. Balfour, Beatty and Company, has been appointed a director of the United Electric Tramways of Monte Video.

**Mr. H. Broadbent,** chief electrical engineer to Perth Corporation, Western Australia, is now on a business visit to England. His address is 4, Queen Street Place, E.C.

**Mr. T. E. Boothby,** of the Oldham Corporation electricity department, has been appointed shift engineer at the works of the Stalybridge, Hyde, Mossley and Dukinfield Tramways and Electricity Board.

**Alderman J. Miles, J.P.,** chairman of Bolton Tramways Committee, was prevented by indisposition from presiding at the annual fancy dress ball of the tramways employees. The guests acted as judges.

**Alderman A. Martin,** chairman of Southend Light Railways Committee, presided at the first of the annual dinners of the employees, and, responding to the toast of his health, said more depended upon the staff who had the handling of the tramway undertaking than upon the members of the committee who controlled it.

**Mr. P. J. Boucher,** for three years traction lamp expert to Siemens Bros. Dynamo Works, Limited, has been appointed to a similar position with the Edison and Swan United Electric Light Company, London. Mr. W. H. Mulhall, who has acted in a like capacity for Siemens' for three years, has also joined the Ediswan staff.

Digitized by Google

**Mr. Percy Hodges**, of the Blackpool Corporation electricity works, has received an appointment at Valparaiso. The staff have presented him with a gold watch, a travelling trunk, and a fountain pen.

**Mr. F. W. Ketley**, general manager, Norwich Electric Tramways Company, and joint treasurer with Mr. P. F. Robertson to a fund started in aid of the family of the late Mr. H. J. Meachen, a motorman of long service, has written to the local newspapers acknowledging the receipt of a sum of £73. Of that amount the company, officers, and employees contributed over £23.

**Mr. R. H. Harvey**, engineer and manager to the Ascuncion Tramways of the Paraguay Central Railway Company, was referred to at a recent meeting of the shareholders in London. The chairman (Mr. V. V. Branford) stated that the directors were fortunate in obtaining the services of a very able and experienced engineer and tramway manager, under whose organisation the electrification of the Ascuncion tramway had proceeded satisfactorily, and would be completed within a few weeks probably, and the installation of the light and power plant before the end of the year. A separate company, the Ascuncion Tramway, Light and Power Company, had been organised and would work in collaboration with the railway company.

## FINANCIAL REPORTS AND MEETINGS.

**The British Electrical Federation.**—The traffic statement for the week ended November 14, 1913, shows that the receipts from tramways and railways amounted to £38,431, as compared with £36,022 in the corresponding week last year, and from omnibuses £11,777, as compared with £1,578, making a total of £50,208, as compared with £37,600. The tramway and railway route mileage was 429.82, as compared with 428.47. Upon such of the services as were working both last year and this year, the receipts show an increase of £2,356 upon the week.

**Buenos Ayres Lacroze Tramways Company.**—The receipts for the year ended June 30 amounted to $6,162,305 legal currency, an increase of $511,477 on the previous year, and the working expenses were $3,830,729, an increase of $361,748, leaving $2,322,575 as net revenue, while $115,380 was received as interest, etc., and $24,917 was brought forward. After providing for debenture interest and other charges the divisible balance is $1,732,937. A dividend of 5 per cent. is proposed, adding $85,400 to the reserve, $250,000 to the renovation funds, and $23,134 to the fund for extraordinary expenses, and carrying forward $30,460.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 60 of the principal undertakings of the United Kingdom for the week ended November 15 amounted to £226,129, or £18,433 more than in the corresponding week last year, while the track mileage was 2,862, or 80 more than for the corresponding week. The receipts were at the rate of £79 0s. 2d. per track mile, an increase of £4 7s. 1d. per mile as compared with last year.

## POSITIONS VACANT.

### DRAUGHTSMAN.

Wanted at once, an expert Draughtsman. Must be a thorough mechanical engineer, familiar with all truck mechanism, and able to design.

Address, stating experience and salary wanted, Anger Manufacturing and Supply Company, Bank Chambers, Preston, England.

### PERMANENT WAY FOREMAN.

Permanent Way Foreman wanted for a small Tramway System of 20 miles route. Applicants to state experience in plate laying, etc., and wage expected.

Box 473. Applicants for the post of Assistant Manager are thanked, and hereby notified that the vacancy is filled.

### BUYING AGENTS.

Experienced and responsible New York firm, now buying for important foreign interests and enjoying favourable relations with many manufacturers—especially in Railway Materials and Equipment—can handle other accounts to advantage. It is hoped that this announcement may favourably interest railways, firms, or individuals needing, in the United States, agents capable of giving better than the usual attention to purchases and shipments from that country. Unquestionable references will be furnished. All correspondence considered confidential.

Address, Broadway, c/o THE TRAMWAY AND RAILWAY WORLD, Amberley House, Norfolk Street, W.C.

## COPPER AND ALUMINIUM MARKET.

November 21, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton :—

**Advertisements for the next issue of which proof is desired should reach us by the second post on Wednesday.**

**The Editorial and Publishing Offices of "The Tramway and Railway World" are at Amberley House, Norfolk Street, London, W.C.**

**Telegrams: "TRAMIGRO, LONDON."**
**Telephone; No. 2948 GERRARD.**

# WEEKLY LIST OF TENDERS INVITED.

### CITY OF BRADFORD.

The Bradford Corporation invite tenders for the supply and erection of the following :—

Contract "R. 28."—One Turbo-Generator of a capacity of about 5,000 kilowatts;
Contract "R. 29."—Storage Batteries, Boosters, and Switch and Regulating Gear;
Contract "R. 30."—Two 1,500 Kilowatt Rotary Converters, Transformers, and Switchgear.

Copies of the specifications, general conditions of contract, and forms of tender may be obtained from Mr. Thomas Roles, City Electrical Engineer and Manager, Electricity Offices, Town Hall, Bradford, on payment of the sum of one guinea for the specification, etc., for each contract. Additional copies of the specifications may be obtained on payment of the sum of half-a-guinea per copy. The sums paid will only be returned upon receipt of a *bonâ-fide* tender, with the return of all the documents in good condition, and after the tenders have been adjudicated upon.

Sealed tenders, on the forms provided, must be sent, fully filled in, to me not later than 10 a.m. on Friday, December 19, 1913, endorsed, "Tender for Electricity Works—Contract 'R. 28,' 'R. 29,' or 'R. 30,'" as the case may be.

The contracts will be let subject to the Fair Contracts Clauses of the Corporation.

The lowest or any tender will not necessarily be accepted.

FREDERICK STEVENS,
Town Clerk.

Town Hall, Bradford,
November 25, 1913.

### COUNTY BOROUGH OF SOUTH SHIELDS.

CORPORATION ELECTRIC SUPPLY DEPARTMENT.

CONTRACTS NOS. 88 AND 89.

The Corporation invite tenders for the supply, delivery, and erection of :—

Two Water-tube Boilers Complete with Mountings and Fittings, etc., as per Specification, and
One Economiser, as per Specification.

Single copies of the specification, general conditions, form of tender, and form of contract can be obtained on and after Saturday, the 29th instant, from Mr. Harry S. Ellis, Borough Electrical Engineer, South Shields, on payment of one guinea, which sum will be returned on receipt of a *bonâ-fide* tender. Further copies may be obtained at a charge of ten shillings per copy, which will not be refunded. Tenders on the form supplied, sealed and endorsed, "Tender for Water-Tube Boiler, etc." or "Tender for Economiser," as the case may be, must be delivered to me at my office, Municipal Buildings, South Shields, on or before noon of the 13th December, 1913. The Corporation do not bind themselves to accept the lowest or any tender, and any acceptance will be subject to the sanction of the Local Government Board being obtained for the carrying out of the work.

J. MOORE HAYTON,
November 24, 1913. Town Clerk.

### SOUTH INDIAN RAILWAY COMPANY, LTD.

The South Indian Railway Company, Limited, are prepared to receive tenders for the supply of :—

No. 1.—Cast Iron Sleepers, about 3,329 tons, for 50 lb. Rails.
No. 2.—Steel Rails (50 lb. per yard Bull Head), about 2,087 tons.
And Fish-Plates for above Rails (about 395 tons).
No. 3.—Steel Rails (80 lb. per yard Bull Head), about 1,571 tons.
And Fish-plates for above Rails (about 69 tons).
And Fish-Plates for 75 lb. Double-head Rails (about 7 tons).
No. 4.—Brushes.
No. 5.—Oils and Colours.
No. 6.—Lamps and Glass.

Specifications and forms of tender may be obtained at the Company's Offices.

Tenders, addressed to the Chairman and Directors of the South Indian Railway Company, Limited, marked "Tender for Cast Iron Sleepers," or as the case may be, must be left with the undersigned not later than 1 o'clock on Wednesday, December 10, 1913.

The Company is not bound to accept the lowest or any tender.

A charge, which will not be returned, will be made of £2 each for specifications Nos. 1, 2, and 3, and 10s. each for Nos. 4, 5, and 6.

Copies of the drawings may be obtained on payment at the office of Robert White, Esq., M.Inst.C.E., Consulting Engineer to the Company, 3, Victoria Street, Westminster, S.W.

By order, V. E. DE BROE, M.Inst.C.E.,
for Managing Director.

Company's Offices,
91, York Street, Westminster, S.W.,
November 25, 1913.

### MADRAS AND SOUTHERN MAHRATTA RAILWAY CO., LTD.

The Directors are prepared to receive tenders for :—

(1) Steel Material (Angles, Flats, Rounds, etc.),
(2) Cast Iron Sleeper Pots and Fittings,
(3) Steel Rails,
(4) Steel Fish-Plates,
(5) Cast Iron Chairs,

in accordance with the specifications, which may be seen at the offices of the Company. The charge for specifications Nos. 1, 2, 3, and 4 is one guinea each, and for No. 5 half-a-guinea each, which will not be returned.

Tenders must be sent in addressed to the Secretary, not later than 2 p.m., on Tuesday, December 9, 1913, marked "Tender for Steel Material," or as the case may be.

The Directors do not bind themselves to accept the lowest or any tender.

H. BONHAM-CARTER,
Company's Offices, Secretary.
91, York Street, Westminster, S.W.,
November 25, 1913.

### COUNTY BOROUGH OF BRIGHTON.

TRAMWAYS DEPARTMENT.

The Council hereby invite tenders for the supply and delivery of 240 tons of British Standard No. 4 Rails.

The specification and form of tender may be obtained on application at my office, at the Town Hall, Brighton.

Sealed tenders, addressed to me, and endorsed "Tenders for Rails," must be left at my office before 10 o'clock in the forenoon on Monday, December 8, 1913.

The Council do not bind themselves to accept the lowest or any tender.

HUGO TALBOT,
Town Clerk.

Town Hall, Brighton,
November 22, 1913.

## LEYTON URBAN DISTRICT COUNCIL.

TRAMWAYS DEPARTMENT.

TICKETS AND TICKET REGISTERING PUNCHES.

The Leyton Urban District Council hereby invite tenders for the supply to the Tramways Department of Passenger Fare Tickets, with or without advertising rights; and Ticket Registering Punches (on hire) from April 1, 1914.

Form of tender and further particulars may be obtained upon application at the office of the Tramways Manager, 590, Lea Bridge Road, Leyton, E., on and after Tuesday, December 2, 1913.

Tenders, enclosed in special endorsed envelopes supplied with the forms, must be delivered at the meeting of the Tramways Committee of the Council, to be held at the Town Hall, Leyton, on Thursday, December 11, 1913, at 7 o'clock.

The Council do not bind themselves to accept the lowest or any tender.

R. VINCENT,
Clerk to the Council.

Town Hall, Leyton,
November 27, 1913.

## SHEFFIELD CORPORATION TRAMWAYS.

ADVERTISING ON TRAMCARS.

The Tramways Committee invite tenders for rights of Advertising on the Tramway Cars of the Corporation—total number of cars about 360.

Particulars and forms of tender, together with "Conditions of Contract" as to under-letting, fair wages, hours of labour, and conditions of employment, may be obtained on application to Mr. A. R. Fearnley, General Manager, Tramways Department, Division Street, Sheffield.

Tenders, sealed and endorsed "Tender for Advertising," to be delivered to the General Manager, Corporation Tramways, Division Street, Sheffield, not later than 11 a.m. on Thursday, the 18th day of December, 1913.

No tender will be considered which is not submitted on the tender form supplied.

The Corporation do not bind themselves to accept the highest or any tender.

Any person or firm sending in a tender will be required to comply with the Council's form of clauses respecting wages, hours, and conditions of labour, and prohibition against assigning or under-letting, as set forth in the "Conditions of Contract," a copy of which may be obtained at my office upon application.

Dated this 27th day of November, 1913.

By order, WILLIAM E. HART,
Town Clerk.

Town Hall, Sheffield.

## TRACTION LEGISLATION FOR NEXT SESSION.

In our last and our present issues appear summaries of the Parliamentary notices of all the private Bills to be promoted in next session of Parliament relating to tramways, electric railways, railless traction and omnibuses. The programme of business for private Bill Committees which is thus marked out does not promise to be a particularly heavy one. The total number of applications of the kind is thirty, as compared with thirty-six a year ago, while for two or three years preceding the numbers did not greatly vary. In the matter of tramways there are only two schemes of considerable magnitude, namely, those of Birmingham and Glasgow Corporations, each of which seeks authority to construct about twenty miles of new lines. These are cases in which large city systems are being pushed further out into the surrounding country. The case of Glasgow in particular is striking, because some of the proposed lines will, if constructed, link up the city and its suburbs with towns at some distance away which are separated from the city by open country. Another feature is the proposal by Bristol Corporation to take powers to acquire the tramway undertaking of the Bristol Tramways and Carriage Company. Bristol is one of the few great cities of the country which does not at present work its tramway system, but at all events it has been excellently served by the company, and if the purchase does take place it will be by agreement and not under the servile conditions of the Tramways Act. The London County Council tramway proposals are this year very small by comparison, but on the other hand there is some prospect that the consents of the road authorities will be obtained, so that the fiasco of some recent years may be avoided. The very wide powers asked by the London United Tramways Company in regard to leasing and working point to efforts being made for mutual arrangements between different companies and schemes for interchange of traffic, which ought to be of much advantage. The bulk of the other tramway proposals are simply for small or moderate extensions by local authorities of their existing systems. An effort is being made by the City of Oxford Electric Tramways Company to come to a statutory arrangement with the Corporation as to abolishing the existing horse tramways and running motor omnibuses instead. The only scheme of importance in connection with London underground electric railways is a Bill promised by the Metropolitan and Great Northern Railway Companies, which seeks to constitute a joint committee to construct the authorised extension of the Great Northern and City line to the Bank of England, and also lines, if they are authorised, forming a junction between the Great Northern and City line at Moorgate Street and the Inner Circle Railway near Aldgate, together with a further extension of the Great Northern and City from the Bank to a junction with the Waterloo and City Railway terminus. It is also sought to make a connecting line from the Great Northern and City Railway to the Great Northern line at Finsbury Park. The idea is to revert to the former scheme under which the Great Northern suburban trains will be able to run over the Great Northern and City line right into the heart of the City of London. This is a revival and improvement of a previous scheme. Probably the most remarkable feature of the Bills is the fact that no fewer than eighteen out of the total seek powers to run motor omnibuses. Practically all these Bills are promoted by local authorities, and in some cases by councils in whose districts there are no tramway systems. The number of proposals to erect poles and wires and to use them for working vehicles on the trackless trolley system is eight, two of which are promoted by companies and the rest by local authorities. A peculiarity about a Bill promoted by the North Eastern Railway Company is that they seek power to work trackless trolley vehicles from Newcastle to Gateshead along the roadway on their high-level bridge. This proposal is the outcome of a failure on the part of the railway company to obtain what they considered sufficient tolls from the owners of horse omnibuses which at present convey passengers across the bridge. Taken over all, the coming session so far as traction legislation is concerned ought to be a fairly interesting one.

## TRAMWAY CHAIRMEN FOR 1913-14.

The reorganisation of the Town Councils after the annual November elections has now been practically completed. In the great majority of cases the chairmen of the various Tramway Committees have been re-appointed for the ensuing year, as will be seen from the following list, which is continued from our issues of the 15th and 22nd inst.

| TOWN. | CHAIRMAN. | VICE-CHAIRMAN. |
|---|---|---|
| Aberdeen .. .. | Councillor J. A. Smith .. | — — — |
| Blackburn .. | Alderman W. Thompson .. | *Alderman Nuttall. |
| Coventry .. .. | Councillor Pridmore .. .. | *Councillor Tugh. |
| Darlington .. | Councillor T. E. Bates .. | — — — |
| Dartford .. .. | Councillor S. K. Keyes.. .. | *Councillor R. Bennett. |
| Dover .. .. | *Councillor E. E. Chitty .. | *Councillor Barwick. |
| Eccles .. .. | Alderman Nuttall .. .. | *Councillor A. Crummack. |
| Leicester .. .. | Alderman S. Flint .. .. | Alderman G. Banton. |
| Plymouth .. .. | Alderman S. H. Phillips (Deputy Mayor) .. .. | — — — |
| Salford .. .. | Alderman H. Linsley .. .. | *Councillor Barrett. |
| Sheffield .. .. | Alderman Sir W. Clegg .. | Councillor A. T. Bescoby |
| Swindon .. .. | *Councillor J. J. Shawyer .. | *Councillor T. C. Newman. |
| West Bromwich .. | Alderman Turley .. .. | — — — |
| Wolverhampton .. | Alderman Sir C. T. Mander .. | Alderman S. Craddock. |

* Denotes a change in the chairmanship or vice-chairmanship.

## ELECTRIC TRACTION AND OMNIBUS BILLS FOR 1914.

In addition to the summaries of Parliamentary notices of private Bills for next session relating to tramways, electric railways, railless traction, and omnibuses which we published last week, the following are abstracts of further notices which have since appeared.

ABERDEEN CORPORATION.—To enable the Corporation, among other things, to construct about two miles of additional tramways, to run trackless trolley vehicles on two specified routes, to work motor omnibuses on any route within the city and on three specified routes outside the city, and to apply the free surplus revenue of the tramway undertaking to the Common Good of the city, or towards the reduction of the rates, or in carrying out city improvements. Solicitor—Wm. Gordon, L.L.D., town clerk, Aberdeen. Parliamentary agents—Martin and Co., 27, Abingdon Street, Westminster.

BIRMINGHAM CORPORATION.—To enable the Corporation, *inter alia*, to construct 17 additional tramway lines of a total length of about 20 miles, to run motor omnibuses in the city, and to widen streets. Solicitor—E. V. Hiley, town clerk, Birmingham. Parliamentary agents—Sharpe, Pritchard and Co., 9, Bridge Street, Westminster.

BOLTON CORPORATION.—To empower the Corporation among other things to construct about 2¼ miles of additional tramways, to run trailer cars and also special cars for special purposes, to carry by trucks on the tramways refuse, road materials, coal, and any other articles required for use by the Corporation, to work motor omnibuses in the borough, and to widen streets. Solicitor—Samuel Parker, town clerk, Bolton. Parliamentary agents—Dyson and Co., Caxton House, Westminster.

BOURNEMOUTH DISTRICT RAILLESS TRACTION.—To incorporate a company and to authorise it to work trackless trolley vehicles on two routes in Bournemouth, to acquire land for a generating station, to run omnibuses, and to enable the company to sell and Bournemouth Corporation to buy the undertaking of the company. Solicitors—Mooring, Aldridge and Haydon, Westover Chambers, Bournemouth. Parliamentary agents—Baker and Sons, 35, Parliament Street, Westminster.

CHESTERFIELD CORPORATION.—*Inter alia* to enable the Corporation to construct two additional tramways and to widen streets. Solicitor—JNO. Middleton, town clerk, Chesterfield. Parliamentary agents—Stevens, Son, and Parkes, 22, Bedford Row, London, W.C.

LEEDS CORPORATION.—Among other things to enable the Corporation to widen streets, to construct eight additional tramway lines within and outside the city, to work trackless trolley vehicles on four additional routes within and outside the city, to run motor omnibuses within the city, and to acquire lands. Solicitor—R. E. Fox, town clerk, Leeds. Parliamentary agents—Sharpe, Pritchard and Co., 9, Bridge Street, Westminster.

MANCHESTER CORPORATION.—To authorise the Corporation, *inter alia*, to widen streets, to extend the time for the completion of authorised tramways, to run omnibuses inside and outside the city, and to acquire lands for the erection of an electric generating station at Davyhulme. Solicitor—Thomas Hudson, town clerk, Manchester. Parliamentary agents—Sharpe, Pritchard and Co., 9, Bridge Street, Westminster.

NEWCASTLE-UPON-TYNE CORPORATION.—To enable the Corporation to construct about 4½ miles of new tramways (single line) in the urban districts of Longbenton and Weetslade, to provide for an appeal to the Board of Trade against a refusal by a local authority of consent to the construction of the tramways and an appeal to a petty sessional court against a refusal by an owner, lessee, or occupier of consent to any attachment to a house or building, to authorise the use of trailer cars and the running of motor omnibuses through Longbenton, to authorise the Corporation to run special cars or services of cars on special occasions and to charge higher fares on such cars. Solicitor—A. M. Oliver, town clerk, Newcastle-upon-Tyne. Parliamentary agents—Dyson and Co., Caxton House, Westminster.

NORTH EASTERN RAILWAY.—Among other things to authorise the company to work trackless trolley vehicles from Newcastle to Gateshead along the roadway on the company's high-level bridge. Solicitor—R. F. Dunnell, York. Parliamentary agents—Sherwood and Co., 22, Abingdon Street, Westminster.

NORTH AND SOUTH SHIELDS RAILWAY.—To incorporate a company and to authorise it to construct an underground electric railway from North Shields, passing under the River Tyne; to acquire lands in South Shields and to erect an electric generating station thereon. (This is a revival of a scheme which was authorised by an Act passed in 1902, but which was never carried out.) Solicitors and Parliamentary agents—Baker and Sons, 35, Parliament Street, Westminster.

NORWICH ELECTRIC TRAMWAYS.—To authorise the company to construct six new tramways, and two doublings and two deviations, of existing lines, to widen streets and acquire lands, to abandon and take up certain existing tramways, to run motor omnibuses, vans, etc., and to raise further capital. Solicitors—Mills and Reeve, 69, London Street, Norwich. Parliamentary agent—John Kennedy, W.S., 25, Abingdon Street, Westminster.

OXFORD AND DISTRICT TRAMWAYS.—To enable Oxford Corporation and the City of Oxford Electric Tramways, Limited (the promoters), to enter into agreements for the sale to the Corporation of the existing tramways and their removal by the Corporation, the provision and working by the company of motor omnibuses, to provide that any agreement may include provisions for the payment by the company to the Corporation of any annual sum and for the company having the exclusive right of working motor omnibuses in the city, and to extend the time for the completion of authorised tramways. Solicitors and Parliamentary agents—Lees and Co., Palace Chambers, Bridge Street, Westminster.

POOLE, SANDBANKS AND WESTBOURNE RAILLESS TRACTION.—To enable the Sandbanks Railless Electric Car Company, Limited, to run trackless trolley vehicles on four routes in Poole, to erect the necessary poles, wires, etc., and to acquire lands and erect a generating station. Solicitors—Dickinson, Gwatkin and Manser, Lloyd's Bank Chambers, Poole. Parliamentary agents—Wyatt and Co., St. Stephen's House, Westminster.

PRESTON CORPORATION.—*Inter alia* to enable the Corporation to make three new streets, to construct five additional tramways in Preston and Fulwood, to use lands now belonging to them for the erection of offices and car sheds adjoining the existing generating station and sheds, and to run motor omnibuses within the borough. Solicitor—Alfred Howarth, town clerk, Preston. Parliamentary agents—Sherwood and Co., 22, Abingdon Street, Westminster.

READING CORPORATION.—To enable the Corporation to make two additional tramways, to work trackless trolley vehicles on five specified routes in the borough, and to run motor omnibuses within the borough. Solicitor—W. S. Clutterbuck, town clerk, Reading. Parliamentary agents—Sharpe, Pritchard and Co., 9, Bridge Street, Westminster.

SHEFFIELD CORPORATION.—To enable the Corporation among other things to carry out eleven street widenings, to construct a tramway, and to extend the powers of the Corporation under their Act of 1907 to run motor omnibuses so that they may be able to run these vehicles in specified districts outside the city. Solicitor—W. E. Hart, town clerk, Sheffield. Parliamentary agents—Sherwood and Co., 22, Abingdon Street, Westminster.

ST. ANNE'S-ON-THE-SEA IMPROVEMENT.—Among other things to authorise the Urban District Council to run omnibuses, and to make by-laws for regulating the routes which may be used by motor omnibuses. Solicitor—Thomas Bradley, clerk to the Council, St. Anne's-on-the-Sea. Parliamentary agents—Baker and Sons, 35, Parliament Street, Westminster.

SKEGNESS URBAN DISTRICT COUNCIL.—Among other things to enable the Council to run motor omnibuses. Solicitor—W. Frearson, Skegness. Parliamentary agents—Baker and Sons, 35, Parliament Street, Westminster.

WALSALL CORPORATION.—To enable the Corporation to make a new street and lay a tramway on it, to work coupled and trailer cars on the tramways, to run trackless trolley cars on four specified routes within and outside the borough, to work motor omnibuses in the borough and also along the trackless trolley routes and beyond, and to use trackless trolley vehicles for road watering, for the conveyance of scavenged matter and road metal and for other sanitary or municipal purposes. Solicitor—Herbert Lee, town clerk, Walsall. Parliamentary agents—Sharpe, Pritchard and Co., 9, Bridge Street, Westminster.

YORK CORPORATION.—To authorise the Corporation, among other things, to work trackless trolley vehicles on four routes in the city, to work motor omnibuses throughout the city, and to exempt special carriages or services of carriages from the restrictions as to fares contained in the York Corporation Light Railways Orders, 1908 and 1912. Solicitor—P. J. Spalding, town clerk, York. Parliamentary agents—Sharpe, Pritchard and Co., 9, Bridge Street, Westminster.

---

A ROTHERHAM PROVISIONAL ORDER.—In addition to the above applications, Rotherham Corporation propose to ask the Board of Trade for a Provisional Order for the construction of a few tramway lines.

## EDISON ACCUMULATORS FOR TRACTION WORK.

There is now a prospect of a substantial advance being made in this country in the use of the Edison accumulator for automobile road vehicles of various classes. On Thursday afternoon the new premises of Edison Accumulators, Limited, situated at 2 and 3, Duke Street, Piccadilly, London, were formally inaugurated. A large company of invited guests inspected the fine new building which has been erected, and made an examination of a number of motor cars fitted with Edison batteries and electric drive. Subsequently the guests were entertained to luncheon, Lord Montagu of Beaulieu, chairman of the company, presiding.

The company, after a preliminary period of organisation are now, we understand, in a position to supply various classes of electric vehicles, both for pleasure and industrial purposes. The Edison battery, in the meantime, will not be manufactured in this country, but will be imported from America. The vehicles themselves will, of course, be produced by various well-known British firms. Special attention, it is believed, will be devoted to industrial vehicles. The extraordinary durability and low cost of maintenance of the Edison storage battery, in which steel and nickel take the place of lead, are now well known.

Mr. W. R. Cooper, speaking at the luncheon, declared that this was the opening of a new era. It was the re-incarnation of the electric vehicle in this country. He referred to the scepticism which still existed owing to the failure of lead accumulators in the past, and pointed out the advantages of the Edison cell, arising from the facts that it was made of steel, that it might be left in a discharged condition without injury, that it could be charged at a very high rate without doing any harm, and that it had a long

Digitized by Google

life. He quoted figures to show the enormous progress made by the electrical vehicle in the United States, and asked why we should not make similar progress in this country. The price of petrol was going up, while the price of electrical energy was continually going down. He proposed the toast of prosperity to the Edison Accumulators Company.

Lord Montagu of Beaulieu, in replying, said that he was not prepared to make any extravagant claims for the Edison battery. It was good enough in itself to convert all those who tried it to a favourable opinion of its merits. He would not have become chairman of the British company devoted to the commercial exploitation of this type of battery unless he had been convinced that the prospects of success were favourable, and that the article was genuine. When he was in the United States last year nothing had struck him more than the very large use of electric vehicles. Nobody would claim that the most perfect electric car fitted with the most perfect battery could take the place of the most perfect petrol car, but there was an enormous field for the electric vehicle, as, for example, the electric runabout used in towns, and the electric vehicle for carrying heavy goods. The results of various tests showed that it cost with a highly efficient petrol engine a halfpenny per ton-mile for traction, while with the Edison battery the cost was a farthing per ton-mile.

Mr. Bernard Drake, who also responded, expressed the view that there was room for both the petrol and the electric vehicle. When he was in America last year a brewery man told him that his firm had been running trucks with the Edison accumulator for two years. This gentleman said he cared nothing about depreciation, as after two years he wiped off the entire cost of the vehicles by his savings as compared with the time when he employed horses. Those who had tried the electric delivery van assured him that they were quite convinced that it was the cheapest mode of moving a ton a mile. He was also informed that in America it was expected that in the future the lead battery would disappear and that the Edison battery would have the field to itself.

Mr. Seabrook, of the Marylebone electricity department, and Mr. Edgcumbe, of the Kingston-on-Thames electricity department, in responding to the toast of the guests, also spoke warmly in favour of the Edison battery, and the proceedings afterwards closed.

## L.C.C. TRAMWAY MATTERS.

GREENWICH STATION BREAKDOWNS AND TEMPORARY POWER SUPPLY.

At last Tuesday's meeting of the London County Council the Highways Committee presented a report on the above subjects, and stated that in connection with the breakdowns of the plant on January 27, March 10, and April 14 last it was necessary to make arrangements for the repair of the plant, and this work was mainly carried out by the makers of the machines. The accounts rendered were:—British Westinghouse Company, £653 9s. 11d.; John Musgrave and Sons, £262 14s. 4d.; Electric Construction Company, £27 11s. 6d.; total, £943 15s. 9d. With reference to the breakdowns of March 10 and April 14, arrangements were made with adjacent tramway authorities for a temporary supply of power. The amounts payable to these authorities were:—Metropolitan Electric Tramways, £420 3s. 4d.; West Ham Corporation, £238 9s. 6d.; Leyton Urban District Council, £110 13s.; total, £709 5s. 10d. The aggregate was thus £1,713 1s. 7d.

In order to cope successfully with the additional car services to be instituted during the winter months, it was advisable that a supply of power should be provided beyond that which could be obtained from the station owing to the fact that the work in connection with the substitution of turbines for the existing reciprocating engines would be in progress. The Committee had been in communication with the London Electric Supply Corporation, who had offered to provide a maximum supply of 1,800 kw. at a fixed price of £3 per annum per kw., plus .35d. per unit. The Committee were advised that these charges were reasonable, and they proposed that the offer should be accepted. The company would provide the necessary switchgear and meters at their works, and also cable ducts between the Council's line of ducts and the Company's generating station. The Council would have to provide the necessary feeder cable between the company's works and the existing trunk mains to the Lewisham sub-station at a point near Nelson Street, Greenwich. This cable could be supplied under the existing contract with the Western Electric Company. It was proposed that the supply should be taken for a period of from four to six months. The cost would amount to about £1,250 a month, involving expenditure of about £5,000 during the remainder of the current financial year.

In connection with the existing contract with the British Westinghouse Company, amounting to £17,915, for the provision of switchgear at Greenwich power station, the Committee recalled the fact that the company had been allowed to sublet certain portions of the work, including the cables to Johnson and Phillips and the automatic regulators to the British Thomson-Houston Company. The British Westinghouse Company now wished to sublet the cables to Siemens Brothers and Company, and the automatic regulators to Brown, Boveri, Limited, instead of to the firms already agreed upon. There was no objection to this course, and the Committee recommended accordingly.

EXTENSION OF THROUGH RUNNING.

It was necessary, the Committee reported, to provide 150 cars with trolley equipment for operating certain through services, which it was proposed should be instituted at an early date, on a number of routes on which it would be necessary for the cars to be worked on both the conduit and overhead systems, and it was proposed that tenders for the necessary equipment should be invited from selected firms.

APPOINTMENT OF CHARGE SHIFT ENGINEER.

Applications for the post of charge shift engineer at Greenwich power station in succession to Mr. W. W. Warren, resigned, were invited by advertisement, the salary being £250 a year, rising by annual increments of £10 to £300. It was stipulated that candidates should be not less than 28 and not more than 40 years of age, and should have experience in the running and maintenance of high-tension electrical plant, steam turbines, and water-tube boilers. The Committee reported that in response to the advertisement 104 applications were received. After careful consideration the Committee recommended the appointment of Mr. J. J. McGregor, who was at present assistant engineer at the Deptford generating station of the London Electric Supply Corporation.

These reports were adopted as was also the adjourned report by the Improvements Committee in favour of widenings of Wandsworth High Street and East Hill.

## MISCELLANEOUS NEWS AND NOTES.

**New Cars and a Garage for Coventry.**—The City Council have approved of a proposal to spend £10,000 on the purchase of ten new covered top tramcars and £2,140 on extra land at the Priestley Bridge depôt for the erection of an omnibus garage.

**Another All-Night London Omnibus Service.**—On the night of November 13 the London General Omnibus Company instituted a second all-night service of motor omnibuses—No. 94A—between Willesden and Liverpool Street. The service is half-hourly.

**Return Motor Omnibus Fares.**—The London General Omnibus Company on November 24 began another attempt to meet tramway competition by granting return tickets at reduced fares between Parliament Square and certain south-eastern points to Greenwich and Woolwich.

**Burnley Tramways Goods Wagon.**—The period for which the Board of Trade sanctioned the use of a goods wagon in conjunction with a motor car having expired, application has been made to the Board for consent to continue the use of the wagon. This was described in the TRAMWAY AND RAILWAY WORLD of December 12, 1912.

**Sheffield Tramways and Tokens.**—Complaint having been made by users of the Sheffield-Rotherham cars that the Rotherham tokens are not accepted on the Sheffield cars, the general manager of the Sheffield tramways has replied that he hopes shortly to issue instructions which will enable conductors to accept the tokens on all Sheffield tramway and omnibus routes.

**Omnibus Creates Traffic on Tramcar Routes.**—"One of those controlling London's tramway system" is reported as saying:—"The panic talk as to the era of the tramway car having passed was unwarranted. The novelty of the motor omnibuses having worn off, the public are going back. The motor omnibus has also created traffic on the tramway car routes."

**Additional P.A.Y.E. Cars for Aberdeen.**—After inspecting a P.A.Y.E. car with an improved staircase the Tramways Committee have ordered tenders to be invited for the supply of six new cars designed for prepayment of fares. The siding at the Sea Beach is to be extended to accommodate three or four extra cars. A report is to be presented to the Council on the question of additional car shed accommodation, either in the form of an extension or the erection of a more central depôt.

**First Double-Deck Railless Car.**—The double-deck trolley car for railless lines which was referred to in our last issue and which has been sanctioned by the Board of Trade for use on the through railless trolley system to be installed in Brighton and Hove, has been designed and constructed by the R.E.T. Construction Company, Limited, the pioneers of railless traction in this country. Through an error in a local report the name of the makers of the double-deck car was incorrectly given in our last issue.

**Ticket Inspection at Manchester.**—Interviewed with reference to a complaint that ticket inspectors are too numerous, Mr. J. M. McElroy has said:—"We have no more ticket inspectors than are necessary. In fact, we have not enough. We are collecting nearly one million pounds, or near that, every year, and we are carrying four million passengers per week. We have less than forty ticket inspectors on the whole system, and their hours are so arranged that they are on duty the whole time the cars are running, which is now day and night."

**Traffic Inducement at Belfast.**—Complaint was made at a meeting of the Corporation recently that £20,000 had been allowed for the laying out of Bellevue Gardens, but Mr. Nance the tramways manager, had obtained £5,000 above that sum. Alderman Tyrrell replied that if Mr. Nance acting for the committee and the public had exceeded his estimate by a few thousand pounds, it was in keeping with many laudable undertakings that had been carried through by the Corporation. When the gardens were completed the public would be as satisfied with the work.

**Proposed Signalling Apparatus at Hull Bridges.**—Pending the presentation of a report by the city engineer on a proposal to install electrical signals at bridges, the Hull Tramways Committee have adopted a suggestion made by the general manager that orderly boys should be stationed at given points to operate signals so that arrangements could be made to divert tramcars to other available routes when a bridge is about to be opened to allow shipping to pass. The engineer has been in negotiation with a number of firms with regard to the supplying of an apparatus, but he has experienced great difficulty in obtaining designs of anything that would be suitable.

**Sequel to a Broken Grab Rail.**—In a claim made against Salford Corporation for £20 as damages for personal injuries the plaintiff stated that she stood on the platform waiting for the guard to descend from the top of the car. Opposite Teneriffe Street the car lurched or oscillated, causing her to lose her balance, and to regain it she seized the centre grab rail above the steps. The rail gave way outwards, and she fell into the roadway. For the defence the guard admitted that the rail was broken, but denied that there was any lurching or oscillation of the car. He had never seen a grab rail broken before. There was a rule that such defects should be reported at once, but there was no inspector to report to at Heaton Park, and he did not see one until just after this occurrence. Three passengers in the car said that in their view the accident was due to plaintiff jumping off the car while it was travelling. The jury gave a verdict for the Corporation, and judgment was entered accordingly.

**Bournemouth and the Municipal Tramways Conference.**—The delegates appointed to represent the Bournemouth Corporation tramways at the recent Conference of the Municipal Tramways Association presented a report on the proceedings to the last meeting of the Council for the municipal year. Besides the enlightenment gained from the several papers submitted, the delegates stated that valuable information was obtained as to the latest form of trackless trolley vehicles at Bradford and Rotherham, and also in the informal meetings held in the evenings in comparing notes as to conditions and positions existing in other towns. Mention was also made of a visit to the works of the United Electric Car Company at Preston. Among the cars going through the works were 75 of the latest Birmingham cars, others for Buenos Ayres, Peru, Russia, etc. Several features were noted for incorporation in the next lot of cars to be constructed for Bournemouth.

**"Meldrum" Improved Forced-Draught Furnace.**—In view of the increased attention devoted to the reduction of working costs by power station engineers, the latest literature issued by Meldrums, Limited, engineers, Timperley, near Manchester, will prove of interest. A 12-page illustrated booklet gives a full description of the improved forced-draught furnace. More than 15,000 of these have been fitted. The principle on which the furnace works is that of steam-jet forced draught, created by specially designed blowers. This is claimed to be the simplest and most economical method, giving better control of the fire and using the smallest amount of steam in proportion to the work done. The average steam consumption, although varying somewhat according to the nature of the fuel and other conditions, is given as being from three to four per cent. of the steam generated. The "Meldrum" furnace, it is stated, prevents clinker adhering to the bars, which are thereby kept cool and their life prolonged, while the saving in bars, the thorough burning of the fuel, and the prevention of waste through the grate, more than compensate for the steam used. Other attributes are fuel economy, increased steaming, and smoke prevention. The furnaces are fitted on the principle of "no cure no pay" anywhere in the United Kingdom. Particulars are also given of the "Sprinkler" stoker with fixed grate and forced draught and the "Koker" stoker with forced draught.

**Imperial Motor Transport Council.**—This Council has been formed as a result of the unanimous desire of upwards of two hundred Colonial delegates, who attended the Imperial Motor Transport Conference held in London in July last. The Council will work in close touch with the Royal Automobile Club, the chairman of the club (Hon. Arthur Stanley) being also chairman of the Council, and the meetings of the Council being held at the club. To enable the Council to deal promptly with inquiries relating to the selection of industrial motor vehicles for service abroad, or the operation of vehicles in such service, a small Technical Inquiries Sub-Committee has been formed. This sub-committee consists of:—Mr. W. Worby Beaumont, consulting engineer to the Chief Commissioner of Police and to the Royal Automobile Club (chairman), Mr. Ashton M. Heath, chief inspecting engineer to the Crown Agents for the Colonies, Mr. H. E. Wimperis, inspecting engineer to the Crown Agents for the Colonies, and Mr. Horace Wyatt, who will also act as hon. secretary of the sub-committee. The Council is in course of forming an Alcohol Motor Fuel Committee in accordance with the request of the delegates. This committee will conduct investigations and experiments relating to the use of alcohol as a motor fuel, the general opinion having been expressed by the delegates that considerable support would be forthcoming from the Dominions and Colonies in aid of work assisting towards the production of a permanent adequate supply of fuel within the Empire.

**Future Developments at Glasgow.**—Councillor Kirkland, chairman of the Tramways Committee, on the occasion of the annual inspection of the tramways undertaking on November 20, mentioned that application was being made to Parliament for power to construct some 21 miles of double track, and indicated that the connecting up of Glasgow with Coatbridge, Cathkin Braes, Millerston, and Milngavie would complete the circling of the city by the system. The Corporation were seeking powers to construct a bridge over the Clyde from Oswald Street to Commerce Street. That would, he believed, materially lessen the great and growing congestion in the centre of the city. He hoped the Corporation would build a second bridge from Dixon Street to South Portland Street. They had 850 cars in stock, and the general manager had been authorised to proceed with the construction of an additional 150 cars. In January, 1911, the two-stage fare was inaugurated. That was but the stepping-stone to the doubling of the halfpenny distance. The further reduction which took place in December of that year brought a temporary decline in the revenue, and in a short time the department were drawing a greater revenue than ever. At the end of the year they expected that the revenue would show an increase of £50,000 over the £1,007,652 received in the previous year. Should the Corporation see their way to increase the 1d. distance from four to six stages and the 1½d. from six to nine stages, and so on, that would be a great boon.

## CONTRACTS AND ORDERS.

**Warrington Council** have allotted contracts as follow:—Low tension cable, the Union Cable Company, Limited; switchboard feeder panel, Drake and Gorham, Limited.

**Sunderland Council** have allotted contracts as appended:—Union Cable Company and L.R. and G.P. Company, cable; E. Green and Sons, new sections and parts for economiser.

**London County Council** have accepted the following tenders:—Hardy and Padmore, three dozen each cast iron feeder pillar cases and cases, £240 8s. 9d.; J. Billingham, Cradley Heath, twelve tons of standard flanged treadplate, £198 18s.

**Canadian General Electric Company, Limited,** have secured the contract for equipping the sub-station at Rougemont, of the Montreal and Southern Counties Railway; a 300 kw. motor-generator set, a bank of transformers, high and low-tension switchboards, lightning arresters and switching apparatus.

**Leicester Council** have placed the following contracts:—United Electric Car Company, 12 top covers for cars; Walter Scott, Limited, 180 tons of steel rails and six tons of fish-plates, £1,273 10s.; T. Wragg and Sons, Limited, 2,800 yards of single way stoneware conduits, 4in. diameter, £136 10s.; Bayliss, Jones, and Bayliss, Limited, 1,000 steel tie bars in three lengths, £79 3s. 4d.; and Ibbotson, Bros., and Co., Limited, six tons of bolts, nuts, and washers, £141.

**Glasgow Council** have accepted tenders as subjoined for the tramways department:—Cast steel pipe connections, Babcock and Wilcox, Limited; cast iron pipe connections, Macfarlane, Strang and Co., Limited; slide valves, Dewrance and Co.; trolley feed cable, St. Helen's Cable Co.; insulated bolts, W. C. Yuille and Co., Ltd., and J. Hally Craig; traction lamps, General Electric Company, Limited; double cotton-covered copper wire, B.I. and Helsby Cables Limited; overhead crane, Alex. Jack and Co.; tower wagon chassis, Halley's Industrial Motors, Limited; steel work, etc.; Dalhousie depôt, Redpath, Brown and Co., Limited; trolley wire, F. Espir.

## PERSONAL.

**Mr. F. O. C. Nash,** who has been in charge of the tramway extensions on the west of Newcastle-on-Tyne, has received an appointment under the Town Planning Act with the Birmingham Corporation. Mr. Nash is an officer in the Territorial Force.

**Alderman J. Smethurst,** J.P., has resigned the chairmanship of Warrington Tramways and Electricity Committee after ten years' service. Both undertakings have proved very successful, and the ex-chairman's work has been cordially referred to by the Council and the local newspapers.

**Mr. Walter T. Young,** who for two years has been traffic superintendent, Oldham Corporation tramways, has been appointed to a similar position under the West Ham Corporation. Before going to Oldham he served under the Aberdeen Corporation for 14 years, and for four years was traffic superintendent.

**Mr. J. J. McGregor,** assistant engineer at the Deptford generating station of the London Electric Supply Corporation, has been appointed charge shift engineer at the London County Council's Greenwich generating station in succession to Mr. W. W. Warren, resigned. The salary is £250 a year, rising by annual increments of £10 to £300. There were 140 applications.

**Mr. Charles Furness,** general manager, Blackpool Corporation tramways, and borough electrical engineer, has received from the Tramways Committee an increase of £200 in his salary of £700 per annum. Improvements introduced by Mr. Furness, including the open touring cars on the circular route, helped to increase the receipts to £74,166, as compared with £42,572 in 1904. For the 8½ months of the present year the receipts have reached £73,018, and it is estimated that by the end of the year the total will be £85,000. The profit in 1904 was £1,032 and last year £18,331, while for the present year the estimate is £25,000.

**Mr. J. Dalrymple,** general manager, Glasgow Corporation tramways, was referred to by the chairman of the Tramways Committee in the remarks which he made at the luncheon on the occasion of the annual inspection of the various departments. Ex-Bailie Kirkland observed that during the year they had increased the wages of the employees in every section with the exception of the general manager. The maximum wage of motormen and conductors had been raised from 33s. to 34s. per week, and next year it would be further increased to 35s. per week. The cars, the chairman added, were carrying 337 millions of passengers per annum.

**Mr. C. W. Shepherd,** general manager, Edinburgh Tramways Company, at one of the three annual concerts on November 21 in aid of the Tramways Employees' Widows' and Orphans' Fund, was congratulated by Mr. B. Hall Blyth, the chairman of the company, on being present after the serious illness which he had gone through. Sir Robert Maule, one of the directors, who presided at one of the other concerts, made a similar observation. These concerts, which were originated by Mr. Shepherd, have contributed £2,450 to the funds, of which sum £1,300 is invested. The employees each first contributed 4s. 4d. and now 6s. 6d. annually, and in ten years their contributions have totalled £1,490.

# FINANCIAL REPORTS AND MEETINGS.

**Isle of Thanet Electric Tramways and Lighting Company.**—The directors recommend a dividend of 3 per cent. on the preference shares for year ended September 30 and transfer of £2,000 to rolling stock reserve. After placing £6,000 towards future maintenance of permanent way and £1,000 to third party insurance reserve, £3,108 remains to be carried forward. For each of the three preceding years 2½ per cent. was paid on the preference shares.

**The British Electrical Federation.**—The traffic statement for the week ended November 21, 1913, shows that the receipts from tramways and railways amounted to £37,077, as compared with £34,422 in the corresponding week last year, and from omnibuses £11,704, as compared with £1,360, making a total of £48,781, as compared with £35,782. The tramway and railway route mileage was 429.82, as compared with 428.47. Upon such of the services as were working both last year and this year, the receipts show an increase of £2,498 upon the week.

**Relining of Bearings.**—The Hoyt Metal Company of Great Britain, Limited, 26, Billiter Street, E.C., have issued a circular containing hints on the relining of bearings with Hoyt's internal combustion engine bearing metal. The publication is intended more especially for the guidance of the mechanician who may happen to have had somewhat limited experience in that particular direction, but a number of points are given which the experienced man should find interesting.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 60 of the principal undertakings of the United Kingdom for the week ended November 22 amounted to £222,277, or £13,203 more than in the corresponding week last year, while the track mileage was 2,862, or 80 more than for the corresponding week. The receipts were at the rate of £77 13s. 3d. per track mile, an increase of £2 10s. 3d. per mile as compared with last year.

(*Continued from page* 468.)

## ELECTRIFICATION OF MELBOURNE SUBURBAN RAILWAYS.

The Agent-General for Victoria is prepared to receive tenders for

Copper Track Bonds and Accessories

for use in connection with the electrification of the Melbourne Suburban Railways (approximately 300 miles of single track) now being carried out.

Specification and form of tender may be obtained from the Agent-General for Victoria on or after Wednesday, November 26, 1913. Any *bonâ-fide* tenderer requiring information in addition to that contained in the specification may apply to the Consulting Engineers, Messrs. Merz and McLellan, 32, Victoria Street, Westminster, S.W.

The charge for the specification in duplicate is £5 5s. and £2 2s. each for any further copies. Sums paid for copies will be refunded on receipt of a *bonâ-fide* tender for the whole of the work included in the specification.

Sealed tenders, marked "Electrification of Melbourne Suburban Railways, Tender for Track Bonds," are to be addressed to the Agent-General and delivered at his office, Melbourne Place, Strand, W.C., not later than 12 noon on Monday, December 22, 1913.

The Government do not bind themselves to accept the lowest or any tender, and ample security will be required from the contractor whose tender is accepted.

## POSITIONS VACANT.

### CITY OF BIRMINGHAM.

ELECTRIC SUPPLY DEPARTMENT.

APPOINTMENT OF DRAUGHTSMEN.

A Senior Draughtsman and a Junior Draughtsman are required by the above Department for the lay-out of a large Electrical Power Station, Boilers, Piping, etc. Only men who have been employed on a similar class of work need apply.

The commencing salary for the Senior Draughtsman will be £130 per annum, rising to £160 at the discretion of the Electric Supply Committee.

The commencing salary for the Junior Draughtsman will be £80 per annum, rising to £130 at the discretion of the Electric Supply Committee.

Applications to be made, not later than Monday, December 15, on the form to be obtained from the Secretary of the Department.

R. A. CHATTOCK,
City Electrical Engineer and Manager.

14, Dale End, Birmingham.

### PERMANENT WAY FOREMAN.

Permanent Way Foreman wanted for a small Tramway System of 20 miles route. Applicants to state experience in plate laying, etc., and wage expected. Address, Box 218, c/o THE TRAMWAY AND RAILWAY WORLD, Amberley House, Norfolk Street, W.C.

### BUYING AGENTS.

Experienced and responsible New York firm, now buying for important foreign interests and enjoying favourable relations with many manufacturers—especially in Railway Materials and Equipment—can handle other accounts to advantage. It is hoped that this announcement may favourably interest railways, firms, or individuals needing, in the United States, agents capable of giving better than the usual attention to purchases and shipments from that country. Unquestionable references will be furnished. All correspondence considered confidential.

Address, Broadway, c/o THE TRAMWAY AND RAILWAY WORLD, Amberley House, Norfolk Street, W.C.

## COPPER AND ALUMINIUM MARKET.

November 28, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton :—

# WEEKLY LIST OF TENDERS INVITED.

### CITY OF ABERDEEN.

TRAMWAY DEPARTMENT.

DOUBLE-DECK "PAY-AS-YOU-ENTER" CAR BODIES.

The Town Council of Aberdeen are prepared to receive tenders for Six Double-Deck "Pay-As-You-Enter" Car Bodies.

Drawings and specifications may be had from the undersigned on application at the Tramway Office, Municipal Buildings, Aberdeen.

Tenders, endorsed "Tender for Double-Deck Car Bodies," to be lodged at the Tramway Office, Municipal Buildings, not later than 12 o'clock noon on Friday, December 12, 1913.

The Town Council do not bind themselves to accept the lowest or any tender.

R. STUART PILCHER,
General Manager.

Corporation Tramway Office,
Municipal Buildings, Aberdeen,
December 1, 1913.

### CITY OF MANCHESTER.

The Electricity Committee of the Manchester Corporation are prepared to receive tenders for the supply, delivery, and erection of Motor Converters or Rotary Converters and Static Transformers, as follows:—

Four 1,000/1,250 kw. Sets.
One 1,000 kw. Set.
Two 650/800 kw. Sets.

Specifications and forms of tender may be obtained on application to Mr. F. E. Hughes, Secretary, Electricity Department, Town Hall, Manchester, on payment of a fee of two guineas, which amount will be refunded on receipt of a *bonâ-fide* tender.

Further particulars and information can be obtained from Mr. S. L. Pearce, Chief Electrical Engineer, Dickinson Street, Manchester.

Tenders, duly endorsed and addressed to the Chairman of the Electricity Committee, must be delivered at the Town Hall, not later than 10 a.m., on Friday, December 19, 1913.

The Corporation do not bind themselves to accept the lowest or any tender.

THOMAS HUDSON,
Town Clerk.

Town Hall, Manchester,
December 1, 1913.

### CITY OF CARDIFF.

STEEL TRAM RAILS AND FISH-PLATES.

The Cardiff Corporation invite tenders for the manufacture, supply, and delivery of 500 Tons of Steel Grooved Girder Rails (British Standard Section Nos. 4 and 4C), and 23 Tons of Steel Fish-plates in accordance with specification and conditions, which, with form of tender, may be obtained at the office of Mr. W. Harpur, M.Inst.C.E., City Engineer, Cardiff.

Sealed tenders, endorsed "Tender for Tram Rails," are to be delivered at the Town Clerk's Office in the City Hall not later than Tuesday, December 16, 1913.

### COUNTY OF LONDON.

The London County Council invites tenders for the supply to the Tramways Department of (a) 10 Tons of Cotton-Covered Copper Wire and (b) Trolley Wire. Form of tender, etc., can be obtained from the Chief Officer, London County Council Tramways, 62, Finsbury Pavement, E.C.

The contractor will be bound to pay to all workmen employed by him in and about the execution of the contract, or any part thereof, wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule. Particulars of the Council's Standing Orders on these matters are given in the *London County Council Gazette*. Tenders must be upon the official forms, and the instructions therein must be strictly complied with. No tender received after 11 a.m. on Tuesday, December 9, 1913, will be considered.

The Council does not bind itself to accept the lowest or any tender, and it will not accept the tender of any person or firm who has withdrawn a tender after the same had been opened, unless the reasons for withdrawal were satisfactory to the Council.

LAURENCE GOMME,
Clerk of the London County Council.

County Hall, Spring Gardens, S.W.,
December 3, 1913.

### WALTHAMSTOW URBAN DISTRICT COUNCIL.

TO UNIFORM CONTRACTORS.

The Walthamstow Urban District Council invite tenders for the supply of Uniforms for their Tramway Employees during the twelve months ending March 31, 1915.

Forms of tender and further particulars may be obtained from Mr. Wm. Murray, A.I.E.E., Tramways Manager to the Council, Tramway Offices, Chingford Road, Walthamstow, on and after Monday, the 8th day of December, 1913.

Sealed tenders, endorsed "Tender for Tramways Employees' Uniforms," to be delivered *by post only* to the undersigned not later than 5 o'clock p.m. on Tuesday, the 23rd day of December, 1913.

The Council do not bind themselves to accept the lowest or any tender, and reserve to themselves the right to accept the whole or any part of a tender.

The contractors will be required to pay the whole of their workmen such rates of wages and observe such hours of labour as are recognised by the various Trades Unions and in force at the time of signing the contract.

C. SYDNEY WATSON,
Clerk to the Council.

Town Hall, Walthamstow,
December 2, 1913.

### CITY OF YORK CORPORATION.

ELECTRICITY AND TRAMWAYS DEPARTMENT.

CONTRACTS FOR 1914.

The Electricity and Tramways Committee of the York Corporation invite tenders for the supply of the undermentioned Stores and Materials between January 1, 1914, and December 31, 1915, viz.:—

Arc Lamp Carbons.
Carbon Brushes.
Electrical Accessories.
Incandescent Lamps (Carbon and Metallic Filaments).
Electric Meters and Time Switches.
Electric Motors and Motor Switches.
General Stores.
Engineering Stores.

General conditions and form of tenders may be obtained from the undersigned on application, and all tenders must be enclosed in sealed envelopes and delivered at the Electricity Offices, Clifford Street, York, not later than Monday, the 22nd of December.

J. W. HAME,
Engineer and Manager.

Electricity Offices, Clifford Street, York.

## COUNTY BOROUGH OF BRIGHTON.

TO CONTRACTORS AND OTHERS.

The Council hereby invite tenders for the supply of 34,000 Jarrah Wood Blocks, and 700,000 Creosoted Deal Blocks of various sizes, and 500,000 feet lineal Creosoted Deal Splines.

The specification and form of tender may be obtained on application at the Office of the Borough Surveyor at the Town Hall, Brighton.

Sealed tenders, addressed to me, and endorsed "Tender for Wood Blocks," must be left at my office at the Town Hall before 10 o'clock in the forenoon on Friday, the 12th day of December, 1913.

The Council do not bind themselves to accept the lowest or any tender.

HUGO TALBOT,
Town Clerk.

Town Clerk's Office, Wigan,
November 29, 1913.

## BOROUGH OF LEIGH, LANCS.

ELECTRICITY DEPARTMENT.

Tenders are invited for the supply and erection of One Water-tube Boiler, complete with Mechanical Stoker, Forced Draught Plant, Air Heater, etc.

Full particulars and specification may be obtained from Mr. Arthur T. Smith, Borough Electrical Engineer, Leigh, Lancs.

All tenders must be delivered at the Town Hall, Leigh, Lancs., not later than 12 o'clock noon, December 19, 1913, endorsed "Tenders for Boiler," and addressed to the Chairman of the Electricity Committee.

W. H. COWBURN,
Town Clerk.

Town Hall, Leigh.

## COUNTY BOROUGH OF WIGAN.

TRAMWAYS DEPARTMENT.

The Corporation of Wigan invite tenders for the supply and delivery of the following :—

6 Double-Deck Tramcar Bodies with Top Covers.
6 Trucks.
6 Complete Electrical Equipments.

Copies of the specification, conditions, and forms of tender may be obtained from Mr. James Slevin, Tramways Engineer, Bradford Place, Wigan, on payment of £1 1s., which will be returned on receipt of a *bonâ-fide* tender. Further copies may be obtained at a charge of 5s. per copy, which will not be refunded.

Sealed tenders, endorsed "Tenders for Tramcars," to be delivered to the undersigned on or before Monday, the 22nd instant.

The Corporation do not bind themselves to accept the lowest or any tender.

WILLIAM HENRY TYRER,
Town Clerk.

Town Hall, Brighton,
December 5, 1913.

## SUCCESS OF THE P.A.Y.E. SYSTEM IN ABERDEEN.

The report by Mr. R. S. Pilcher, general manager of Aberdeen Corporation Tramways, on the results of five months' experience with pay-as-you-enter cars, is one of the most important testimonies yet given in this country to the value of the system. The outcome of Mr. Pilcher's experience with eleven pay-as-you-enter cars has been so satisfactory that he recommends the Corporation to adopt cars of this kind for their whole tramway system. The Town Council, following a proposal by the Tramways Committee, have decided as a step in that direction that six new cars about to be ordered shall have bodies of the pay-as-you-enter type. It will be remembered that Leicester Corporation recently, also in the light of experience, ordered that ten new cars about to be obtained should also be so constructed that the P.A.Y.E. method can be used. In view of the anticipated difficulty with the method in this country in the shape of delay on busy routes, it is specially interesting to note the Aberdeen experience. The feeling has existed in many quarters that on busy routes, with graded fares and top-deck cars, worse time would be made owing to delay in loading. But in Aberdeen the reverse has been the case. It is true that the traffic in Aberdeen cannot be compared with that, say, in Glasgow or Manchester, but still it is very considerable. Moreover, it appears that it has been at the busiest times, such as during agricultural show traffic, that the pay-as-you-enter cars have specially shown themselves able to cope with everything that was going and to keep time, while the other cars were late. Further, the pay-as-you-enter cars have been run on the Woodside route, which is the busiest in the city. The public have willingly responded to the request to have their money ready before entering the cars. The amount of change to be given has greatly diminished. It is admitted that loading at a busy terminus takes slightly longer than in the case of ordinary cars; but the pay-as-you-enter vehicles save time at every stopping place. Records taken on two busy days showed that on the average the ordinary car took 35 minutes for a certain journey, while the pay-as-you-enter took a minute less. Yet the latter carried one more passenger per car-mile and earned nearly a penny more per car-mile. Another point made is the reduction in the number of accidents arising from passengers leaving cars in motion. Then there is the increase in receipts owing to all fares being collected and to the fact that the conductor can keep a better lookout for passengers, and this increase is not merely in total receipts per car but per car-mile, in spite of the fact that a greater mileage was run. It appears that in Aberdeen the cost of altering a roof-covered car for the pay-as-you-enter system is about £30, and for an open-top car considerably less. No doubt the figure would vary somewhat in different towns according to the style of car at present in use, but the Aberdeen quotation gives an idea of the cost, which may be of general utility. Tramway managers throughout the country will await with interest further reports from the towns which have adopted the system, and particularly as to the question whether on busy routes, in any case, average car speed is reduced or not. The point at present is that so far as experience has gone those engaged in working cars on this method are its strong supporters.

## ELECTRIC TRACTION LEGISLATION.

The following additions to the list of proposals for Bills in next session of Parliament, published in our issues of November 22 and 29, brings the total number of electric traction and motor omnibus Bills up to 31.

METROPOLITAN AND GREAT NORTHERN RAILWAY COMPANIES.—This Bill, which is promoted jointly by the Metropolitan and Great Northern Companies, seeks to constitute and incorporate a Joint Committee of directors of the two companies, to constitute the Joint Committee a railway company; to provide for the leasing to the Joint Committee by the Metropolitan Company of the undertaking of the Great Northern and City Railway Company, which was vested in the Metropolitan Company by their Act of 1913; to vest in the Joint Committee powers of the Act of 1913 to construct an extension railway in the City of London, to provide for the construction and maintenance by the Joint Committee of the above railway and also other railways proposed in the Bill, and to enable the two companies to raise additional capital. Solicitors—C. de W. Kitcat, 32, Westbourne Terrace, Paddington; R. Hill Dawe, 1, The Abbey Garden, Westminster. Parliamentary agents—W. and W. M. Bell, 3a, Dean's Yard, Westminster; Dyson and Co., Caxton House, Westminster.

A NEW PROCEDURE.—Special interest attaches to a notice, published since our last list of Bills was printed, of an application to be made to the Board of Trade for a Provisional Order to authorise extensions of already authorised trackless trolley routes. It has been the custom when promoters have brought Bills before Parliament to enable them to instal and work the trackless trolley system on specified routes to seek powers for the Board of Trade to authorise future extensions by means of Provisional Orders. Procedure by Provisional Order is, of course, cheaper and more convenient than procedure by private Bill. Hitherto, however, no applications have been made to the Board of Trade for the purpose, but in the coming session one private Bill at least (among other objects which it contains) seeks authority for trackless trolley extensions. Now, however, the Western Valleys (Monmouthshire) Railless Electric Traction Company are applying to the Board of Trade for a Provisional Order to extend the trackless trolley system which was authorised by the company's Act of 1913. The following is an abstract of the notice.—Application by the company to the Board of Trade for a Provisional Order, pursuant to sections 28 and 55 of the Western Valleys (Monmouthshire) Railless Electric Traction Act, 1913, to authorise the company to provide and use trackless trolley vehicles on three additional specified routes in Abertillery; to incorporate with the Order such provisions of the Tramways Act, 1870, and of the Act of 1913 as may be deemed expedient for erecting and maintaining trolley vehicle equipment, breaking up streets, charges for passengers, use of electrical power, etc.; and to authorise the company to raise additional capital. Parliamentary agents—R. W. Cooper and Sons, 5, Victoria Street, Westminster.

## P.A.Y.E. CARS AT ABERDEEN.

THE MANAGER RECOMMENDS THEIR USE ON ENTIRE SYSTEM.

Mr. R. Stuart Pilcher, the general manager, Aberdeen Corporation tramways, has submitted to the Tramways Committee a report on the working of the Pay-As-You-Enter cars, which were introduced into Aberdeen on April 28 last. Mr. Pilcher, who recommends the adoption of the P.A.Y.E. type of car over the whole system, points out in his report that the public have responded very willingly to the request that they should have the fares ready on entering the cars. There had been a certain amount of criticism, which was only to be expected with any new system, but that criticism had been directed more to the details of the car, which could be remedied, than against the general principle of the P.A.Y.E. system. With regard to the loading of cars at a busy terminus or for any special event, the P.A.Y.E. cars no doubt took slightly longer to load, but those cars would save time at every stopping-place en route. The average running per journey on a certain afternoon showed a saving of nearly a minute in favour of the P.A.Y.E. cars, while there was an increase in the number of passengers per car mile of about one, and an increase in the receipts per car mile of .8od.

The prepayment of fares had a direct influence on the finances. Any person who studied the conditions of the present-day tramway traffic must prove to himself that a conductor—no matter how conscientious he might be—could not collect all the fares and attend to his other numerous duties. A great deal of the extra revenue was due to the prepayment of fares, and to the fact that the conductor was in a better position to see all intending passengers.

Mr. Pilcher states that during the past five months he has given close personal observation to the Pay-As-You-Enter cars. These cars have had to deal with the Agricultural Show traffic, on which day the ordinary cars were, in some cases, too crowded for the conductor to collect all the fares, whereas the Pay-As-You-Enter cars required no checking; and on another occasion—that of the "Timmer Market"—thousands of children were carried without any delay, whereas the cars on other routes were, in many cases, running late. He had no hesitation in recommending the Pay-As-You-Enter cars to the committee as an improved method of tramway operation by which greater public safety can be obtained. The number of Pay-As-You-Enter cars in operation on the Woodside route at present was 11, leaving 47 top-covered cars of the ordinary type. The cost of altering this type of car would be £30 each; the cost of altering the open cars would be considerably less than this.

The Town Council on December 1 adopted a recommendation by the Tramways Committee that, in the meantime, the general manager should be authorised to invite tenders for bodies of the Pay-As-You-Enter type for the six new cars recently sanctioned. It was also decided that the report by the general manager should be forwarded to the Board of Trade, and application made for the sanction of the Board to the permanent use of the Pay-As-You-Enter cars.

THE ROYALTIES ON PREPAYMENT CARS.

In reporting on the proceedings of the Municipal Tramways Conference the manager of Lowestoft tramways referred to the discussion on prepayment cars. The secretary of the International P.A.Y.E. Tramcar Company has written to the local newspapers correcting the statement as to the royalties to be paid. He says:—"The report states that the cost of altering the cars is between £30 and £40 each, and the royalties amount to £20 a year. This latter statement is a distinct error. The royalty of £20 is that of a sum paid once down for the life of the car, and as the life of a tramcar is anything from 10 to 15 years, or even more, you will see that the royalty per year works out at less than £2 per annum, and the royalties for all of the cars in Lowestoft, instead of being £380 per annum, would be less than £38 per year."

## BELFAST PROFIT-SHARING SCHEME.

The Secretary of the Irish Local Government Board forwarded the following communication to a meeting of Belfast Corporation held on December 1:—"The Local Government Board for Ireland have had under consideration the appeal to them, from the persons aggrieved, against the surcharge of £2,800, in respect of 'salaries and wages' paid to the members of the staff of the Belfast City Tramways, which was made by the auditor at the audit of the accounts of the City and County Borough of Belfast for the year ended March 31 last. The Board have given careful consideration to the views and contentions put forward by the appellants, and to the legal opinions quoted in their statements, and have taken further legal advice; and they have found that the surcharge was lawfully made. While, however, the Board are clearly of opinion that the scheme put into operation for making the tramway employees participants in the profits of that undertaking was not within the legal powers of the Belfast Corporation, they have found that the subject matter of the surcharge was made in such circumstances as to make remission fair and equitable, and have given directions for the preparation of the order accordingly, copies of which will be forwarded in due course to the Corporation."

**Tramway Siding for Works Employees.**—A tramway siding into the works of Courtauld and Co. has been constructed from the Coventry tramways. Its use will obviate the congestion and the delay hitherto caused while cars have been loaded and unloaded with the employees in Foleshill Road.

## L.C.C. TRAMWAY MATTERS.

EXCESS COST IN TRAMWAY CONSTRUCTION.

At last Tuesday's meeting of the London County Council the Highways Committee reported that for the construction of tramways in Tooley Street the total expenditure had amounted to £7,796, being £746 more than the estimate approved by the Council. The increase was chiefly due to the fact that the sum of £1,100 which the Council had to pay to Bermondsey Borough Council in respect of the removal of an underground convenience was £500 in excess of that provided for in the estimate. The remainder was due to the increased cost in regard to carrying out alterations to mains at night time in order to avoid interfering with the heavy traffic through Tooley Street. In the case of the tramways from Norton Folgate to near Liverpool Street, the trackwork had been constructed well within the sum provided in the estimate of £12,590. The cost of the alterations to mains, however, exceed the sum provided in the estimate, and the total cost of construcion, including alterations of mains, had amounted to £18,640. The additional expenditure on the mains (some £6,300) arose to a large extent from the requirements of the City Corporation that all the mains should be relaid in one trench, and that the work should be carried on continuously by day and night. The committee recommended the sanction of supplemental estimates to cover the increased cost.

The Finance Committee pointed out that the addition of £6,500 to the estimated cost of the tramways from Norton Folgate to near Liverpool Street was equal to over 50 per cent. of the sum originally estimated, and it would involve an additional charge on the tramway revenue of £520 in the first year for interest and repayment of debt. The Finance Committee had suggested to the Highways Committee that before the estimates for the construction of tramways were put forward some arrangements should be arrived at as to the manner in which the alterations to mains were to be carried out.

Consideration of this report was adjourned.

ABBEY WOOD CAR SHED.

Ten tenders had been received from selected firms for the erection of the completion of Abbey Wood car shed. The tenders varied in amount from £16,981 to £20,000, and the architect's estimate was £17,900. The Committee recommended that the lowest tender, that of Rowley Bros., Wood Green, amounting to £16,981, should be accepted. The cost of erection, including incidental expenses, was estimated at £18,900, but this amount did not include the cost of paving, trackwork, lighting, etc., while it was also proposed to instal hydraulic pit jacks and a traverser at the car shed. The Committee would report on those works as soon as possible, and meantime they asked approval for an estimate of £18,900. The whole car shed when completed would provide accommodation for 80 cars, comprising 25 in the first section and 61 in the part now proposed to be dealt with. The recommendation was adopted.

THROUGH RUNNING AND RETURN FARES.

A through service of cars between Holborn and North Finchley, arranged with the Metropolitan Electric Tramways, Limited, was, the Committee reported, commenced on November 23.

COTTON-COVERED COPPER WIRE.

The undermentioned tenders were received from selected firms for the supply of (a) one ton of T.C.C. copper wire .229 inch diameter, and (b) 1½ tons of D.C.C. copper wire .229 inch by .229 inch required in connection with winding car field coils.

| | Prices a ton. A. | Prices a ton. B. | Discount. Per cent. |
|---|---|---|---|
| Siemens Brothers and Co. .. .. | £ 96 5 0 | £ 80 6 8 | — |
| British Insulated and Helsby Cables | 93 6 8 | 91 0 0 | 2½ |
| Midland Electric Wire Co. .. .. | 93 6 8 | 93 6 8 | 2½ |
| London Electric Wire Co. & Smith's, Ltd. | 91 0 0 | 93 6 8 | 2½ |
| India Rubber, Gutta Percha and Telegraph Works Co. .. .. .. | 99 17 8 | 100 17 6 | 2½ |
| Johnson and Phillips .. .. .. | 98 0 0 | 101 0 0 | — |
| Henley's Telegraph Works Co. .. | 105 0 0 | 101 10 0 | 2½ |
| General Electric Co. .. .. .. | 105 0 0 | 102 13 4 | 2½ |
| Callender's Cable and Construction Co. | 110 0 0 | 112 0 0 | 2½ |
| Western Electric Co. .. .. .. | 110 0 0 | 112 0 0 | 2½ |

The Committee had accepted the tender of the British Insulated and Helsby Cables amounting to £224 1s. 9d. The estimate of the chief officer was £245. The action taken was approved.

PETROL-ELECTRIC CARS.

A discussion took place on the adjourned report of the Highways Committee regarding the experiment which has been made with petrol-electric cars. This report stated that a service of petrol-electric cars (which were horse cars converted and equipped) had been run between Tooley Street and Greenwich Church, in order that an idea might be gained of the cost of running, etc. The result had convinced the Committee that the Burdett Road and Grove Road route (where it was proposed to use this system of traction) was not suitable for working by petrol-electric cars.

Mr. G. A. Dutfield said he wanted to know how long the experiment lasted, whether it was an exhaustive test, and why the Committee had come to the conclusion that this particular route was not suitable for petrol-electric cars. Residents in the neighbourhood were anxious to get tramcar facilities, and not long ago the Stepney Borough Council were invited to inspect the petrol-electric system in company with members of the London County Council. Although he was not present on that occasion, he believed it was considered that the system was suitable to the needs of the

Digitized by Google

district. He moved that the report of the Committee be not received, on the ground that insufficient information was given to the Council.

Mr. G. H. Hume (vice-chairman of the Committee) expressed regret that the report of his Committee should have been considered meagre. There was no desire to hide the facts in connection with the experiments which the Council had undertaken. Those experiments were commenced on July 10 last, and had been continued without a break since that date, and the cars were still being run. The real reason why the Committee could not recommend the adoption of the system was that the cost per car mile of running the petrol-electric motors was so much higher than that of the Council's present electric tramcars, and it would be actually cheaper to run a service on the conduit system. It was, of course, possible that, in the course of time, there would be a considerable improvement in the petrol-electric car, but at the present time, reckoning the cost of petrol at 1s. 2½d. per gallon, it was estimated that the cost per car mile of running would be 8.319d., whereas the actual cost per car mile for the year 1912-13 of the Council's present electric tramcars only amounted to 6.62d.

Mr. Dutfield then withdrew his motion, and the report of the Committee was formally received.

## TRAMWAY CHAIRMEN FOR 1913-14.

The following list of chairmen and vice-chairmen of the various Tramway Committees for the ensuing year is continued from previous issues :—

| Town. | Chairman. | Vice-Chairman. |
|---|---|---|
| Aberdare .. .. | Councillor E. M. Hann .. | ——— |
| East Ham .. | *Councillor T. H. Cowper .. | ——— |
| Great Yarmouth .. | Alderman C. A. Campling .. | Councillor J. T. C. Salmon. |
| Ilkeston .. .. | *Alderman S. Shaw .. .. | *Alderman W. Tatham. |
| Middlesex C.C. .. | Alderman H. Burt .. .. | *Councillor F. Goodyear. |
| Oldham .. .. | Alderman F. G. Isherwood .. | Councillor F. Elliot. |
| Oxford .. .. | *Alderman E. J. Brooks .. | Alderman F. W. Ansell. |
| Southend .. .. | Alderman A. Martin .. .. | ——— |
| Southport .. .. | *Councillor T. S. Richardson .. | ——— |
| Stalybridge .. | *Alderman R. Wood .. .. | *Alderman Wm. Lee. |
| West Hartlepool .. | Councillor Martin .. .. | Councillor Charlton. |

* Denotes a change in the chairmanship or vice-chairmanship.

## MISCELLANEOUS NEWS AND NOTES.

**New Workshops for Wallasey.**—The Tramways Committee have taken over land in Seaview Road as a site for new workshops.

**Lincoln and Sunday Running.**—By 15 votes to five the City Council have rejected a motion in favour of the running of the tramway service on Sundays.

**Heavy Fine for Obstruction.**—A driver of a motor lorry, summoned at East Ham for obstructing a Corporation tramcar for a distance of 800 yards, was fined £3 and costs.

**Councillors and Free Passes.**—By the casting vote of the Mayor, the Brighton Corporation have rejected a proposal of a councillor that free passes on the tramcars should be granted to members of the Council.

**Explosions from the Use of Bitumen.**—The Board of Trade have appointed a committee to consider the causes of explosions which have occurred in connection with the use of bitumen in laying electric cables, and to report as to any steps which should be taken to prevent explosions in future from the use of bitumen or similar substances.

**Tramway Insurance.**—Replying to statements that the tramways undertaking was not sufficiently insured, Alderman Meyer, chairman of the York Tramways Committee, has pointed out that there was a very heavy insurance of the employees up to £90,500. There was a third party risk of £5,000, and the cars and car shed were insured very heavily.

**Mumbles Railway Electrification.**—It is understood that the scheme for the electrification of the railway between Swansea and the Mumbles will involve an expenditure of over £50,000. Mr. C. W. G. Little, chief electrical engineer of the British Electrical Federation, Limited, is advising the Swansea Tramways Company in the matter.

**Gateshead Tramway Company's Omnibus Services.**—The motor omnibus service recently instituted between Scotswood, Blaydon, and Swalwell was extended to Dunstan on November 3. For the whole distance the fare is 5d. An application to the Newcastle Tramways Committee for permission to run motor 'buses over the Scotswood Bridge has not been entertained.

**New Cars and Plant for Northampton.**—Since 1906 the passengers and receipts on the Corporation tramways have increased by 50 per cent., and the Tramways Committee on December 3 were authorised to enter into contracts for the supply of four new top-covered vestibule cars at £2,600, for the extension of the car sheds and stores at £2,400, and for additional generating plant at £4,400.

**Device to Register Upper Deck Passengers.**—Sheffield Tramways Committee are considering the desirability of adopting on all their cars a passenger-registering device patented by Messrs. Singleton and Priestman, of Sheffield. It has been given an extended trial by the department, with highly satisfactory results. The apparatus is attached to two of the steps of the staircase to indicate an ascent or descent, and the numbers are recorded on a dial, which can be seen on the platform by the conductor and intending passengers.

**Traffic Inducement at Blackpool.**—Four more transparent maps of the tramways system are to be fixed in prominent positions. At night the maps can be illuminated. Last season the Corporation tramways manager had a similar map placed in the vicinity of Talbot Square for the convenience of visitors, showing all the principal places of entertainment and public buildings. In order to further popularise the cars, the committee have ordered another 100,000 pocket maps of the tramway system for public distribution next season. Three more top covers are to be obtained for the Marton cars, bringing the total of this class of car to 25, of which 12 will be in use on the Marton route during the winter.

**Opening of the Buenos Ayres Tramways Subway.**—The underground line of the Anglo-Argentine Tramways Company in the centre of Buenos Ayres between Plaza Mayo and Plaza Once, the first line of its kind in South America, was inaugurated on December 2 by the President of the Republic. The line had been running for five days without a hitch, and for that time the company had admitted the public on free tickets. The trains travel perfectly with great speed. The staff is well trained, the rolling stock is luxurious, the stations are brilliantly lighted, with a large amount of daylight. The opinion of experts is that the new service will be a very successful one. The double line connects with the Buenos Ayres Western Railway terminus, and is over two miles long.

**Litigation Over London Tramway Assessment.**—In the King's Bench Division on December 2 the Islington Assessment Committee endeavoured to show cause against a rule for a mandamus granted in July last ordering the committee to appoint a person to make a provisional valuation list with a view to inserting a portion of the London County Council tramways in the borough at a reduced assessment in consequence of a reduction in profits, owing to motor omnibus competition. Counsel said that in order to justify a reduction in the assessment it must be shown that the reduction was substantial, continuous, and permanent. Mr. Justice Bray, in giving judgment, said that in his opinion sufficient continuity of decrease of profits had been shown. It was also clear that the Assessment Committee had gone wrong on a matter of law. The Court made the rule absolute for peremptory mandamus, with costs. Mr. Charles applied to have the operation of the mandamus stayed, pending an appeal. Mr. Justice Bray replied that if the Court of Appeal thought the Assessment Committee should have a little time they would grant it.

**Third-Party Insurance.**—Allusion was made by a shareholder at the annual meeting of the Provincial Tramways Company to the setting aside of £2,000 for third-party insurance. Mr. J. Barber Glenn, the secretary, stated that this was the first time the company had set aside money for third-party insurance. It had been the practice of the company and also of the Isle of Thanet Tramways Company, with which he was connected, to insure in an office, and the payments were very considerable. In the Isle of Thanet Company at one time it was a very disastrous transaction for the insurance company; the Provincial Tramways had always been a very good risk. Accidents were always a very uncertain factor, and the last people that insured them at Gosport had not paid a single sixpence during the year until within a fortnight of the end of the 12 months, when a control wire got adrift and injured a woman, who recovered £550 damages and £170 costs. The directors had made a start towards insuring their own risks by setting aside £2,000. They were insured with an office up till next September, and possibly, when they had got the fund up to £4,000 or £5,000, they might safely do their own insurance altogether. It was entirely a question of policy.

**Singular Claim by a Motorman.**—A compensation claim brought against the Salford Corporation tramways department by a motorman, named Samuel Glynne, was heard at Salford County Court

**List of Applications made to the Light Railway Commissioners in November, 1913, for Light Railway Orders.**

Digitized by Google

on December 1. Applicant, a motorman, contended that owing to the hand brakes being defective on the car which he drove on February 26-29 he suffered severe nervous strain. He narrowly escaped running down a man. Either the shock of this incident or the nervous strain and tension throughout the days he was in charge of the car constituted, he submitted, an accident within the meaning of the Act. He was taken eventually to the Lancaster County Asylum for a time. Claimant said he made a report on the brakes on two occasions, and once he took the car back to the depôt. Another motorman gave evidence that when the brakes were turned a certain distance "no white man could shove them any further." Mr. Jackson, for the defence, said the brake in question was of the ordinary type which had been used for many years by Salford and other Corporations. An easier brake, the Peacock, had now been introduced, and Car 95, which was in perfect order, was the last to be dealt with. Dr. Austin, medical superintendent of Hope Hospital, said that Glynn was entirely irresponsible when he was sent there. The sudden strain of nearly having an accident might have accentuated an attack of mania. Mr. Wm. Holford, general manager of the Salford tramways, said every care was taken to see the brakes in the cars were thoroughly overhauled and examined. In the case of reports on brakes such as the applicant in this case made with regard to Car 95, the forms were collected and a gang of men every night saw to the remedying of any defects, if such were found. Officials who examined Car 95 after Glynn's reports said nothing wrong was found. Two drivers who had had experience of No. 95 about the time the applicant was driving it said they found nothing defective in the brakes. Judge Stanger said that he was satisfied that the accusations against the management of the tramways as to the neglect of reports about defective brakes were not justified. It was not the fact that the brakes were defective as alleged. He held, further, that the applicant's attack of mania was not the result of the occurrence described by him—the narrow escape from running over an old man. His Honour therefore found for the Corporation, at the same time expressing sympathy with the applicant.

## CONTRACTS AND ORDERS.

**Leyland Motors, Limited,** have received a contract for the supply of a motor tower wagon to Accrington tramways, at £610.

**Tudor Accumulator Company, Limited,** have received a contract from Salford Council to weld 600 tramway rail joints at 30s. per joint.

**Rotherham Tramways Committee** have placed a repeat order with E. Bennis and Co., Limited, for two machine-stokers and self-cleaning compressed-air furnaces for a Lancashire boiler.

**J. Eaves and Company** have received a contract to construct a transformer chamber at the island platform near the Blackpool Hippodrome for the tramways and electricity department, at £355.

**Peckham Pendulum Trucks.**—Contracts have been awarded recently to the Brush Electrical Engineering Company, Limited, for 15 Peckham pendulum trucks for Bexley Heath tramways and 5 for South Shields Corporation tramways.

**Bournemouth Council** have allotted contracts as subjoined:—United Electric Car Company, car bodies and vestibules; Brush Electrical Engineering Company, trucks (Brill type); British Westinghouse Electric and Manufacturing Company, Limited, electrical equipment, £343, and brakes, £150.

**Hailey's Industrial Motors, Limited,** have received an order from the Borough of Leith tramway department for a 25 h.p tramway tower wagon. The company have also received an order from the Glasgow Corporation tramway department for two of these tower wagons, which will likewise be of 25 h.p. capacity.

**South Lancashire Tramways.**—The chief contractors for the new turbine which has been installed in the generating station of the South Lancashire Tramways Company at Howe Bridge were Messrs. Brown, Boveri for the generator, Messrs. Howden for the turbine, and the Rees Roturbo Company for condensing plant.

**London County Council** have accepted tenders as follow:—Rowley Brothers, Wood Green, erection of completion of Abbey Wood car shed, £16,081; British Insulated and Helsby Cables, one ton of T.C.C. copper wire .220in. diameter, and 1½ tons of D.C.C. copper wire .220in., for winding field coils, £224 1s. 9d., less 2½ per cent. discount.

**Warrington Council** have placed the following contracts for extensions of buildings and plant at the electricity works:—Buildings, J. Dolan and Son, £2,738; boiler plant, Babcock and Wilcox, Limited, £2,362; turbo-alternator plant, J. Howden and Co., Limited, £5,843; condenser plant, Worthington Pump Company, Limited, £3,344; economiser plant, Goodbrand and Co., Limited, £203 10s.

**The Simplex Rubber Company, Limited,** of Scrubbs Lane, Willesden Junction, have supplied "Simplex" rubber tyres to the Inter-Transport Company for their 5-ton "Berna" lorries, which are working successfully in London and the provinces, particularly in Lancashire. Within the last few days the Simplex Company have fitted tyres to three more Berna lorries for this company, making a total of seventeen lorries running on "Simplex" solid rubber tyres.

**Perth Contracts.**—In connection with the erection of a power house and plant for the Perth (Western Australia) tramways and lighting and the electrification of some of the railway sections, it is reported that four contracts have been let for a total of £188,521 with Babcock and Wilcox, Limited, Willans and Robinson, Limited, and the British Westinghouse Company, and that tenders have been called in London for three others, estimated at about £85,000. All the works are to be completed by June, 1914.

**Omnibuses for Liverpool.**—Orders have been placed by the City Council with W. A. Stevens, Limited, the Brush Electrical Engineering Company, Limited, and Straker and Squire, Limited, for the supply of two motor omnibuses each.

## PERSONAL.

**Mr. W. H. Oldfield,** of Chelstow, has been presented with a framed photograph of the staff and employees of Torquay Tramways Company "in affectionate appreciation of his kindly interest in them."

**Mr. Thomson,** the engineer-in chief to the Government of Western Australia, according to an Australian journal, dated October 23, was then in England preparing a report in connection with the electrification of some of the railways in Western Australia.

**Mr. Charles Corner,** M.Inst.C.E., M.Am.Soc.C.E., chief engineer, Beira and Mashonaland and Rhodesia Railways, Bulawayo, proceeds on extended leave at the end of November, 1913, prior to retirement, after fifteen years' service. During this period Mr. Corner acted as general manager in 1909 and again in 1913.

**Alderman D. L. Winter,** the Rotherham Tramways Committee reported to the Council on December 3, had been re-elected Chairman of the Committee. Mr. Caine moved that the report be referred back to the Committee. The Town Clerk ruled that the standing orders gave each committee absolute right to elect their chairman, but it was competent for the Council to refer a minute back. Councillor Caine stated that the Council had decided to double the Fitzwilliam Road track. At the committee meeting the chairman announced through the Town Clerk that it was his intention to ask for a Board of Trade inquiry, and that he was doing so as a private individual and a ratepayer. It was impossible, he thought, for Alderman Winter to disassociate himself from the chairmanship unless he resigned his position. The motion was not seconded.

**Mr. R. S. Tresilian,** secretary of the Dublin United tramways, has just returned to Dublin after a month's tour on the Continent in the course of which he visited Brussels, Paris, Berlin, Vienna, Budapest, Athens, Smyrna, and Constantinople. Much attention was devoted to tramway systems both ancient and modern, ranging from one horse single-deck cars to the latest installation of overhead electric traction of which Constantinople now boasts an example. Mr. Tresilian travelled through the scenes of the late war in the Balkans, and found many of the districts in a truly distressing condition from which a recovery can only be expected after the lapse of many months. Unfortunately for commerce and industry the principal attention of the people concerned seems to be concentrated on an early effort to renew the struggle which has already proved so disastrous to them. At present, however, the want of money ensures peace.

**Mr. Charles Furness** on December 2, by 22 votes to 20, received from Blackpool Council the increase of £200 recommended by the Tramways and Electricity Committee in his salary as tramways manager and electrical engineer. His total remuneration will thus be £900 per annum. Alderman Brodie, chairman of the committee, in moving the minutes, said that Mr. Furness's work warranted the increase. He was appointed electrical engineer twelve years ago at £520 per annum, which was later increased to £600. On the death of Mr. Lancaster, the late tramways manager, four years ago, Mr. Furness was appointed to that position, practically as an experiment, with another £100 per annum. At that time the profits were £8,000 per annum. The following year the profits were £10,000, in March last £18,300, and it was estimated that for the present year they would be £25,000. The electricity profits had been as low as £58 and as high as £8,000, and this year the profit would be £7,000. Mr. Furness had brought about a general saving in the consumption of coal. When he came they were using 15,000 tons compared with 12,000 to-day, and as the price had been considerably increased the saving was very considerable. In addition to that the current had been doubled in quantity.

**Mr. Christer P. Sandberg** died at an advanced age on December 4 at 4, Crystal Palace Parade, Upper Norwood. He was the author of the specification of the Silicon steel rail, and was one of the oldest members of the Institution of Civil Engineers.

## FINANCIAL REPORTS AND MEETINGS.

**Brazilian Traction, Light and Power Company.**—The directors have declared a dividend of 1½ per cent. for the three months ending December 31, 1913, on the 6 per cent. cumulative preference shares.

**Scarborough Central Tramway Company.**—At the annual meeting on November 26 the chairman (Mr. J. Pirie) said that in recommending a dividend of 4s. per £5 share (6d. more than last year) the directors had gone on safe lines, as they could have paid more. £100 was added to the reserve fund, and £75 carried forward.

**Six Months' Increase of Traffic at Glasgow.**—For the first half of the financial year ended November 30, the tramways traffic receipts amounted to £520,677, as compared with £492,054 in the corresponding period of the preceding year, an increase of £37,623. The number of passengers carried was 164,000,000, as compared with 150,000,000 in the corresponding period of the previous year.

Digitized by Google

**Burmah Electric Tramways and Lighting Company.**—A dividend of 3 per cent. (3s. per share) is announced on the preference shares, placing £5,000 to reserve for depreciation and carrying £908 forward. The directors report that there is no prospect of paying off the arrears on the preference shares. They therefore recommend that they be cancelled, that the dividends be increased from 6 to 7 per cent. per annum, and that they be non-cumulative.

**The British Electrical Federation.**—The traffic statement for the week ended November 28, 1913, shows that the receipts from tramways and railways amounted to £37,676, as compared with £35,031 in the corresponding week last year, and from omnibuses £12,155, as compared with £1,333, making a total of £49,831, as compared with £37,264. The tramway and railway route mileage was 429.82, as compared with 428.47. Upon such of the services as were working both last year and this year, the receipts show an increase of £1,679 upon the week.

**L.C.C. Traffic Receipts Still Improving.**—The traffic return of the L.C.C. tramways for the week ended November 19 showed that the number of passengers was 10,143,622, against 9,539,234 in the corresponding week of last year. The receipts were £42,565, against £40,248, being an increase of no less than £2,317. What is even more interesting is that the aggregate for the financial year so far as it has gone now shows for the first time an increase compared with the corresponding period of last year. Owing to the heavy decreases in the early part of the financial year the aggregate up till now has shown a decrease. The receipts from April 1 to November 19 amounted to £1,406,435, against £1,405,305, being an increase of £1,130.

**Allowance for Renewals as Part of a Deficit.**—Bexley Council have received from the accountant a report on the results of working the tramways and electricity undertakings. The tramways showed a deficiency of £383, and the electricity undertaking a surplus of £99. The amount provided in the rate estimates for the trading undertakings was £286. In arriving at the deficiency the sum of £242 had been charged to tramways revenue as a first contribution to a fund created for the purpose of wholly or partially meeting the cost of future renewals in accordance with the Council's resolution. The Council have adopted a recommendation that the accountant be authorised to charge the amount of the tramways deficiency to the district fund for the year 1912-13.

**Result of Petrol Car Traction at Morecambe.**—Mr. W. H. Pickles, the chairman of the Morecambe Tramways Company, in moving the adoption of the report at the annual meeting on November 29, said there was an increase in receipts of £649. The cars had travelled 52,005 miles, an increase of 14,777, and the number of passengers had been 424,136, an increase of 105,259. The receipts per car mile had been 13.10d., a decrease of 1.7d. per mile as compared with the previous year. The total working expenses had been 8.12d. per car mile, as compared with 9.6d. the previous year. The report was adopted, and a dividend of 3 per cent. was declared, as against 2½ per cent. last year. The secretary (Mr. Petty), replying to a vote of thanks, said that petrol had been the salvation of the company, which would have gone into bankruptcy but for the decision of the directors to adopt petrol-driven tramcars, the first of their kind in England.

(*Continued from page* 476.)

## POSITIONS VACANT.

### ILFORD URBAN DISTRICT COUNCIL.

TRAMWAYS DEPARTMENT

CHIEF INSPECTOR.

The above Council invites applications for the position of Chief Inspector on their tramways.

Salary, £3 per week.

All applicants for this position must have had previous training as Tramway Inspectors, and preference will be given to those with experience as Tramway Inspectors in the Metropolitan police area.

Particulars of duties, etc., may be had on application to Mr. L. E. Harvey, A.M.I.E.E., Tramway Offices, Ley Street, Ilford, to whom all applications should be addressed by December 20, endorsed "Chief Inspector."

By order, ADAM PARTINGTON,
Clerk of the Council.

Town Hall, Ilford,
December 3, 1913.

### MAINS FOREMAN.

Applications are invited for position of Mains Foreman as Assistant to Line Engineer. Must have good experience of Tramway Cable-work, including Fault-testing. Three years' agreement, salary commencing at £200 per annum, payable in local currency; free quarters. Applications, by letter only, with copies of testimonials, to be sent to the Secretary, Shanghai Electric Construction Company, Limited, Basildon House, Moorgate Street, London, E.C.

### DEPOT AND TICKET CLERK.

Wanted, capable man, used to ticket office and depôt inspector's work. Apply Gateshead Tramways Motor Service, Picktree Lane, Chester-le-Street, Co. Durham.

**DICK, KERR & CO.,**
**Limited,**
**ABCHURCH YARD, CANNON STREET,**
**LONDON, E.C.**
**ENGINEERS & CONTRACTORS.**

**Complete Equipment**
**TRAMWAYS & LIGHT RAILWAYS**
**at home and abroad.**

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 60 of the principal undertakings of the United Kingdom for the week ended November 29 amounted to £221,342, or £14,801 more than in the corresponding week last year, while the track mileage was 2,862, or 80 more than for the corresponding week. The receipts were at the rate of £77 6s. 9d. per track mile, an increase of £3 1s. 11d. per mile as compared with last year.

## COPPER AND ALUMINIUM MARKET.

December 5, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton :—

THE Tramway & Railway World
WITH MOTOR TRAFFIC SECTION

ESTABLISHED 1892. LONDON, DECEMBER 11, 1913. VOL. XXXIV.

# LONDON UNDERGROUND RAILWAY DEVELOPMENTS.

## THE CHARING CROSS AND THE PADDINGTON EXTENSIONS.

Among the numerous developments which are taking place, or are about to be entered upon, in connection with the great system of underground electric railways in London, there are two of special interest at the present time. One of these is an extension which has just been opened, and the other an extension possessing special engineering features which will shortly be ready for traffic. The former is a prolongation of the Baker Street and Waterloo Railway from Edgware Road to Paddington, and the latter an extension of the Charing Cross, Euston, and Hampstead Railway from the present terminus at Charing Cross to the Victoria Embankment. We shall deal first with the Charing Cross line, as the work there is of a nature which is in some respects unparalleled.

The Charing Cross, Euston, and Hampstead Railway was opened for traffic in June, 1907, and a fully illustrated description of it appeared in our issue of July 4 of that year. The line extends from a terminus under the forecourt of the South Eastern Railway Station at Charing Cross northwards to Camden Town, where it diverges into two branches, one to Highgate and the other to Hampstead and Golders Green. Its total length is eight miles, double track, each track being carried in a separate circular tunnel, after the manner usual with tube railways. The train service on the part of the line between Camden Town and Charing Cross in one of the most frequent in the world. For a long time it has been obvious that advantage would accrue, alike to this railway, to the Metropolitan District and Baker Street and Waterloo Railways, and to the public, if the Charing Cross and Hampstead line could be extended from the present Charing Cross terminus for a distance of some 200 yards to the Thames Embankment, so that an interchange station with the Metropolitan District and Bakerloo Railways might be provided there. The present Charing Cross stations on the District and Bakerloo lines adjoin one another, and are connected by a long sloping passenger subway, but there are no lifts nor escalators. The inconvenience arising from this cause would also be removed by a satisfactory scheme for extending the Charing Cross line. An Act of Parliament was accordingly obtained in the session of 1911, authorising the construction of this short extension, together with a balloon-shaped loop partly under the Thames, round which trains could be sent, and so obviate reversing and crossing over at a dead-end terminus. The work of construction began in October, 1911, and it is expected that the extension will be opened for traffic in March next.

The extension, as will be seen from the plan on the following page, forms a single track loop which measures in all 880 yards, and at its southern part it passes under the River Thames and reaches 65 yards beyond the Thames Embankment wall. The south-bound trains will run from the present terminus round the loop to a new single-platform station underneath the station of the District Railway, and adjoining the station of the Baker Street and Waterloo Railway. Then the trains will continue northwards, and join the existing north-bound line. Peculiar difficulties have been encountered in the work. The whole of the land for some distance inside the Embankment wall may be described as water-logged; it is, in fact, a sort of underground lake, of which the wall, which goes right down to the clay, forms one side. The ground behind it receives water from the higher land to the north. Another feature was that the available space between an electric sub-station adjoining the District Railway station and the overhead railway bridge of the South Eastern Railway Company was very limited. Moreover, the South Eastern Railway Company are in possession of powers for widening their bridge. It accordingly became necessary that the new station of the Charing Cross and Hampstead line should be built partially under the west side wall of the electric sub-station, and it was necessary to underpin a portion of the District Railway station building, which is now being re-erected on a more elaborate scale. The whole of the cables supplying current to the Charing Cross and Hampstead Railway had to be diverted from a cable shaft which the station tunnel cut right through, and piers had to be provided in view of the widening of the Thames bridge.

At the west end of the electric sub-station accordingly it was necessary to cut down from the surface and put in underpinning to support the sub-station wall. This cut was really a large open shaft and had to be of greater dimensions than would otherwise have been necessary as an enlargement of the electric sub-station had to be provided for, and also the erection of the piers just mentioned. Substantial brick side walls were constructed supporting an arch which carries the sub-station wall and the floor of the extension. The arrangements were such that the tube tunnel does not carry the weight, that being taken by the brick arches. The cut had to go down 65 ft. below the street level for the purpose of putting in the invert of the station tunnel. The top of this tunnel is 40 ft. below the surface. This cut extended for a distance of about 66 ft. longitudinally, and it was situated centrally with respect to the length of the new Hampstead Railway station platform to be constructed. An enlargement was made at one end

of this brick length to provide a shield chamber for constructing the station tunnel. The station itself extends for some distance north and south of this point, the total length being 350 feet.

A working shaft was constructed underneath the South Eastern Railway bridge, and from there a little service heading was driven to a point which was to become the centre of the tunnel, and was then curved round to make a connection with the open cut before referred to. The top of the tunnel, as constructed, is in the water-bearing strata, the lower part of it being in London clay. Normally there are about 13 or 14 ft. of water in the gravel overlying the clay. In the circumstances, the tunnel had to be driven with the aid of compressed air. The shield was erected in the bottom of the open cut, and the top of the shield was covered with puddled clay, so as to keep the air in. This clay was weighted with iron segments (to be used afterwards in tunnel lining), so that the roof might not be blown up by the air pressure. Then the shield was started forward, and work proceeded steadily. A hooded shield was used, and the tunnel was constructed by the clay pocket system of tunnelling, as used when the Baker Street and Waterloo line was constructed under the river. Holes were dug by hand in the ballast round the hood of the shield. These were filled with puddled clay, and the shield was then pushed forward into it. By this means a great deal of timbering work was obviated. The top of the tunnel is only 10 ft. below the foundations of the District Railway, yet tests on the platforms of the station on that line showed that there was no sign of any settlement. This is a very good achievement considering the size of the new station tunnel and that it was being driven under a substantial building.

The station tunnel with which we have been dealing is 21 ft. 2½ in. in diameter. Coming now to the running tunnel under the river, which is 12 ft. 9 in. in diameter, there are only from 18 in. to 3 ft. of clay above the top of this tunnel, and above that is the water-bearing ballast forming the river bed. The air pressure in the tunnel had therefore to be very carefully regulated in order to balance the pressure of the water in the river, which varied with the rise and fall of the tide. For this purpose a special tide gauge was erected on the Charing Cross landing-stage. It consisted of a long plank of wood with a scale marked on it. It was so graduated as to indicate the air pressure necessary to be equal to the head of water at any particular time. A man examined this gauge every hour, and the air pressure in the tunnel was regulated accordingly. In the air-pumping engine room there was besides a clock dial with a movable circle round it, which was so adjusted as to give the engine man an idea as to how the tide was requiring changes in the air pressure. The dial was adjusted from hour to hour by examination of the gauge in the river. The air pressure required in the tunnel varied from 9 lb. to 18 lb. per square inch. With all these arrangements the work proceeded smoothly and satisfactorily. The curve of the tunnel had to be sharp, so as not to interfere with the navigable channel of the river, where dredging may be carried on in future. This was the more necessary as the top of the tunnel is less than 10ft. below the bottom of the river. The dredging limit is 65 yards out from the Embankment wall. The part of the tunnel which is under the Thames was commenced on November 2, 1912, and was finished on March 6 last.

As will be seen in the accompanying plan, the District Railway at Charing Cross runs at right angles to the Baker Street and Waterloo Railway and the Charing Cross and Hampstead Railway, the District station being situated between the two. Ten feet below the District station platforms at the west end there has been constructed a large circulating area. This area is approached by stairs from each District platform. From the level of this area two escalators descend to the Charing Cross and Hampstead Railway station, and two to the existing Bakerloo Railway station. The arrangement is clearly shown in the two cross-sections which are herewith reproduced. By this scheme the long sloping passenger subway which has hitherto been used between the District Railway and the Bakerloo Railway will be abolished.

The escalators, which are of the Otis Elevator Company's make, will, in the case of the new railway, land the passengers at the platform level, but those for the Bakerloo line will land them 10 ft. above the platform level (as the railway has to be crossed by a bridge), the platforms being thereafter approached by stairs. Each pair of escalators consists of an ascending one and a reversing one, the latter normally running downwards, but in the case of a breakdown of the other it can be reversed in direction, so that whatever happens there will always be one to run uphill. A spiral staircase is also being provided in the working shaft. The escalators to the Hampstead Railway platform have a 28-ft. rise, and those to the Bakerloo station a 32-ft. rise. It will also be seen from the drawings that passengers changing from the Hampstead to the Bakerloo Railway, or *vice versa*, will be able to do so without ascending, as a deep-level passenger subway is provided between the two tube stations and passes directly underneath the District Railway station.

Mr. H. H. Dalrymple Hay, to whom we are indebted for information embodied in this article, has acted as consulting engineer, with Mr. G. Blacklock as resident engineer, on behalf of the London Electric Railway Company. The work was carried out by Messrs. John Mowlem and Company as contractors, with Mr. W. Rowell as contractors' agent. The staff of the London Electric Railway Company have, however, laid the permanent way, and attended to various details. The permanent way, which is now practically completed, is similar to that on the existing portion of the Charing Cross and Hampstead Railway. It will be remembered that there the sleepers are laid on a concrete bed, and that the ends are overhung, the rails being mounted on the overhung ends, so that a certain amount of elasticity is given to the track. Third and fourth rail electric conductors are, of course, employed.

The work of erecting the new railway station building above the District Railway at Charing Cross is now advancing. The frontages will be of white Portland stone, and the roof will have a glass dome. New staircases down to the District platforms will be provided.

### The Paddington Extension.

The extension of the Baker Street and Waterloo Railway from Edgware Road to Paddington, a distance of about half a mile, was also authorised by Act of Parliament in 1911. Since then, of course, authority has been given to extend the line still further, and to make a junction between it and the London and North Western electric line at Queen's Park, near Willesden. That part of the work is now in progress, but will not be completed for some time. The original line was opened for traffic in March, 1906, and was described and illustrated in our issue of March 8 of that year. The extension from Edgware Road to Paddington was opened for traffic on the 1st inst. Starting from Edgware Road, the tunnels run underneath a basin of the Grand Junction Canal, and then under Praed Street, crossing that thoroughfare twice. The line

then bends to the north, and runs under the Paddington terminus of the Great Western Railway. Beyond the station which has been constructed there is a cross-over road for reversing the trains. This will be used until the extension beyond Paddington is opened. There is nothing particular about the tunnel work, which is all in the London clay, and the tubes are 12 ft. and 12 ft. 6 in. in diameter. The only sharp curve is one of five chains radius, where the tunnels bend round into Paddington. The steepest gradient with the load is 1 in 30, and against the load, 1 in 60. These are the retarding and accelerating gradients for trains entering and leaving Paddington.

A flight of steps leads down from London Street to a booking hall which has been constructed underneath the cab road on the arrival side of the Paddington terminus. The subway from the Metropolitan Railway station at Praed Street to the Great Western station has been altered so as to admit also of passengers reaching the new booking hall by this means. There is also a subway from the new widened portion of the Great Western terminus. Leading from the booking hall to the new station is a tunnel 21 ft. 2½ in. in diameter, in which there are two Otis escalators, one ascending and the other reversible. Between the escalators there is an ordinary fixed staircase. The rise of the escalators is 40 ft., and they lead right down to the station platform level. The level of the rails is 60 ft. below the street. The permanent way arrangements are similar to those of the existing Baker Street and Waterloo and Charing Cross and Hampstead Railways. The engineers and contractors for this extension are the same as in the case of the Charing Cross work.

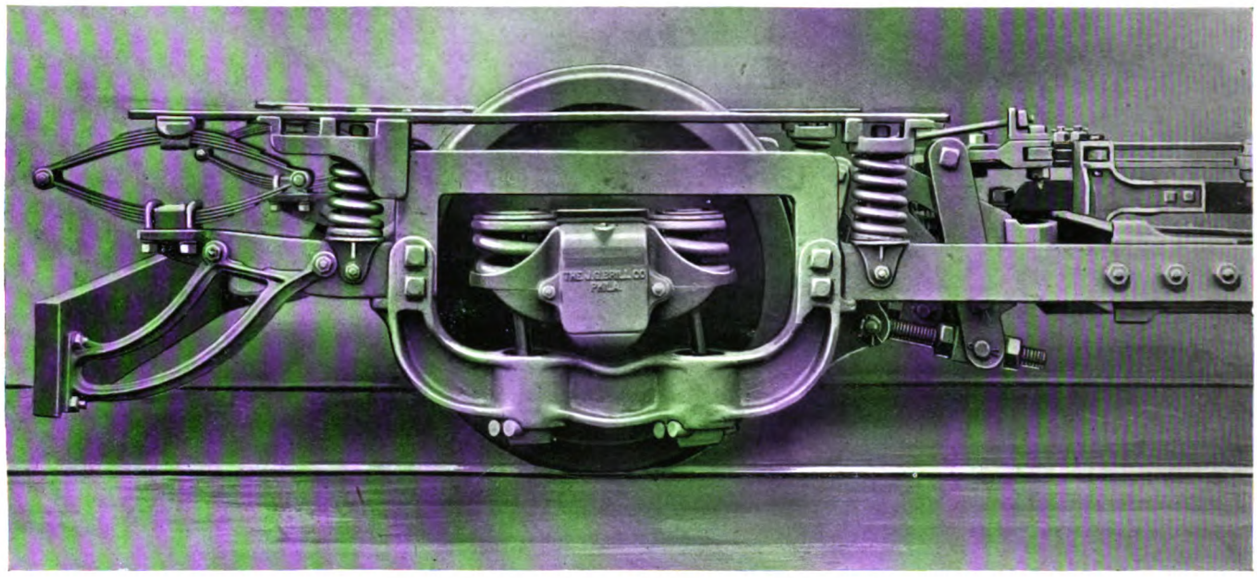
## BRILL PATENTED "RADIAX" TRUCK.

At various times in the development of electric railways the radial-axle principle has been taken up, but until recently no satisfactory results have been obtained, although many trucks have been built. These trucks have been of two classes, one having each pair of wheels in an independent frame and the other having both axles within the same frame; the first has the advantage of lightness and the other of furnishing a better spring support to the car body. Six-wheel radial trucks have so limited a field that they need not at present be considered. The large size of the early electric motors precluded success, but the advantages of having a longer wheel base for four-wheel cars have all along been so evident that all truck builders have given more or less attention to the subject, with the hope of some day working it out to a successful conclusion. Curves in city tramway systems generally do not permit a wheel base of a non-radial-axle truck of more than 7 ft. 6 in., and therefore the overhang of cars measuring 28 to 30 ft. over the platforms, and in some cases having vestibules and carrying a large part of the load outside the wheel base, have made it impossible entirely to obviate oscillation. In Vienna, Nuremberg, Moscow, St. Petersburg, and some other European cities, and in several cities in this country, the single-axle truck has been considerably used and in most instances discarded. During the period 1905-1907 several tramways in this country introduced improved radial-axle trucks, both of the single and double-axle type, but without success. Like their predecessors, these trucks led the way to a better understanding of the subject, and the enterprising tramway managers who were willing to give them a thorough trial have paved the way for the successful type. Some of the principles of construction were developed in attempts to correct the difficulties which were discovered after the trucks were put in service, others were taken from non-radial-axle trucks, and still others were devised to meet the contingencies which arose in the better understanding of the conditions to be met.

The experiments of the J. G. Brill Company with radial-axle trucks, covering a long period, culminated in the type illustrated. This truck is now in use on many American lines, including the Philadelphia Rapid Transit Company, the Milwaukee Electric Railway and Light Company (two lots have been ordered since the first proved successful), Memphis Street Railway Company, Union Electric Company of Dubuque, Union Street Railway Company of New Bedford. Among other users are the Linares Tramways of Spain, Lisbon Tramway Company, Port Elizabeth Electric Tramways Company, Hobart Tramways and Launceston Tramways, Tasmania, Kioto Electric Traction Company, and both the French and English tramways of Shanghai, China.

Like the other types of Brill trucks, the "Radiax" is built with solid forged side frames, and to this principle of construction the makers attach fundamental importance. The solid forged frame is considered to be especially necessary for the long-wheel-base truck of a radial-axle type. This principle has been followed in the construction of the frame of the Brill rigid-wheel-base No. 21-E truck during a period of 20 years, and it is maintained that it is plainly evident that a longer frame with wider yokes makes an even greater demand for the strongest, lightest, and best-possible construction. Castings, however well designed and made, should, of course, be avoided where it is possible to use solid forgings.



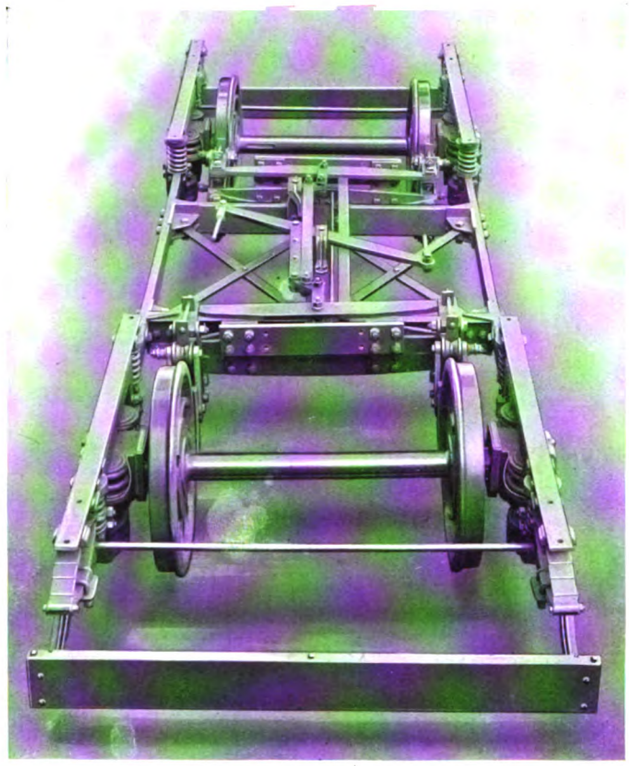
The Swing Link in the Brill "Radiax" Truck.

In explaining the principle on which the Brill truck radiates, it should be first stated that the early designs of radial trucks, used chiefly in Europe, relied on sliding surfaces or rollways between the radiating and the non-radiating portions of the truck, which necessitated what was virtually a double frame. These trucks would radiate if well lubricated and kept in good condition, provided that the curves were taken at a speed high enough to bring into play sufficient centrifugal force. The chief difficulty was that there was no force available to return the truck to its normal position on leaving a curve, and reliance had to be placed on springs to produce this effect. The springs required constant and careful adjustment, for if they were too powerful they would check radiation and if too weak the wheels would gag or leave the rails. It was found that swing links, by which the load was suspended below the axle, reduced friction to a minimum and at the same time tended to keep the axles in parallel without the use of springs or other devices. But the swing link has a grave defect, in that on straight track it transmits to the car body every irregularity of the track with multiplied effect, and this is particularly noticeable in cars having a wheel base

Digitized by Google

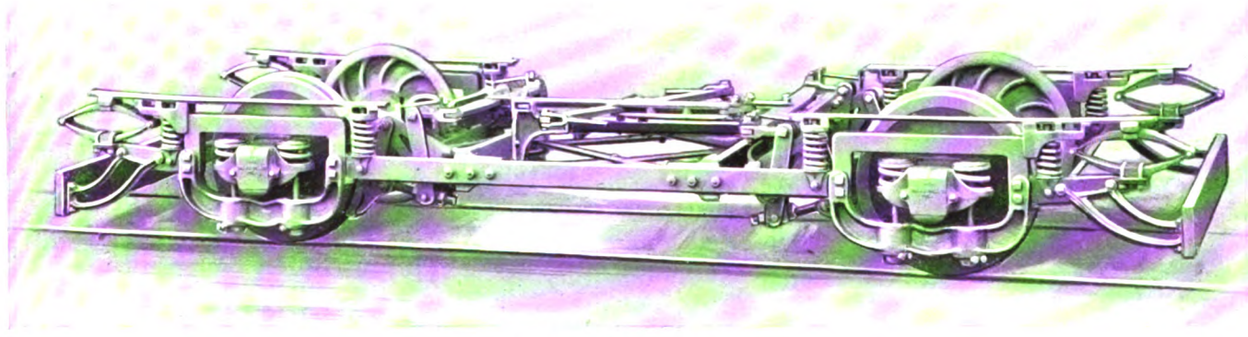
shorter than 11 ft., as the king pins are necessarily close together, giving the whole construction a small amount of lateral stability. Therefore the ordinary swing link radial-axle truck is generally found to oscillate horizontally, causing a snakelike motion. Until a means was found of obtaining free radiation, coupled with the return of the axles to their normal position on leaving a curve and at the same time holding the car body in a direct line on straight track, the radial-axle truck was doomed to failure.

In the Brill truck the swing link is made to perform its functions in a manner which gives both free radiation to the axles and stability and easy riding to the car body, by a patented device of the J. G. Brill Company. This consists of pairs of swing links of special form, mounted on spiral springs which rest in ears cast on each side of the journal boxes. The upper end of the link is of hemispherical form and rests in a socket casting at the top of the spring. The link passes through the spring, and at its lower end has two pins, or trunnions, which engage in grooves formed in a casting enclosing the lower part of the frame yoke. On straight track, with the link in upright position, the frame rests on both pins. When a movement of the swing link commences, as the car passes over some irregularity in the track, at that instant one or other of the pins comes out of engagement with its groove, even though the movement is imperceptible, thereby producing an inclination between the two supporting points of the link equal to half the distance between the pins, which sets up an immediate and powerful tendency to return to normal position. If the link were pivoted on a single pin at the lower end, the swing would require to be considerably more, or half the distance between the two pins of the Brill device, to produce an equal force to assist in returning the axle to its normal position. As the pin returns to its groove, any tendency of the link to swing past its normal position is instantly checked by the sudden force in the opposite direction generated as the other pin leaves its groove. It will therefore be seen that the double-pin arrangement has a two-fold office—one to assist in holding the link in an upright position against the effect of irregularities of the track, and the other to assist the link in its tendency to draw the axle back to its normal position when leaving a curve, or when the normal position of the axle is disturbed momentarily owing to track irregularities.



Brill "Radiax" Truck.

The double-pin device does not hinder the primary function of the links, that of allowing the axles to radiate freely on curves. The links are much longer and permit a considerable radial movement of the axles to take place without requiring them to assume an excessive inclination, the resistance generated by their inclination being overcome by the centrifugal force stored in the car. If the car is stopped on a curve, the axles will return gradually towards but never quite resume their normal position, but will rapidly increase their angle of radiation as the car is started again. It should be remembered that a radial truck can safely take curves at a much higher speed than a rigid-wheel-base truck and that the faster a curve is traversed the easier a truck will radiate and the less will the flange wear.



Brill "Radiax" Truck.

An important feature of the Brill "radiax" truck is the use of the motor as the only means of connecting the axle to the king bolt, which is the pivotal point; the motor, being rigidly connected to the cross member which carries the brake rigging, causes the axle and brakes to radiate with it as a whole from the king bolt

Digitized by Google

and form a complete unit corresponding to a single-axle pivotal truck. In old types of radial-axle truck construction it was usual to construct a complete pivotal frame, usually called a sub-truck; this frame connected the journal boxes with the king bolt and supported the brake rigging and the motor. It is difficult to obtain a rigid construction in such a frame and at the same time allow room for the motor, and, of course, it adds very considerably to the weight of a truck of this class. There is no objection to pivoting to the motor; the most exhaustive tests have proved that it does not produce undue wear on the bearings, and the ordinary construction of motor frames is amply strong to offset any risk of failure owing to the extra strain. Careful measurements taken from motors in service have shown that the motor bearings wear less in horizontal direction, due to the brake thrust, than they do in a vertical direction, owing to the weight of the motor, and that the life of the motor bearings is limited by vertical wear and not by horizontal wear which would allow the gears and pinions to get out of pitch with each other.

Brake gear has been a constant source of trouble on most designs of radial-axle trucks. In the Brill "Radiax" truck the brakes are fitted with inside-hung shoes, the advantages of which are well known; the brake rigging is arranged with the pivotal points directly over the king bolts, giving the same radial action to the brake beam as to the wheels and providing an equal pressure on the whole surface of all four brake shoes against the wheel treads. The other brake details have been completely developed, and experience has proved them to be reliable.

The patented "half-ball" brake hanger is used in all Brill trucks, and is self-adjusting for wear, and therefore noiseless. The spring arrangement is the same in principle as that which has proved so efficient in the Brill standard non-radial axle single truck No. 21-E.

By providing a long wheel base to the car body the radial-axle truck reduces the overhang and therefore eliminates galloping motion, uncomfortable to passengers and destructive to the car and roadbed; it reduces the side overhang on curves, and by furnishing a more extended support permits a lighter construction of the car body; it also secures the full tractive force of the wheels, not obtainable in a two-motor equipment of an eight-wheel car. This truck is intended for cars longer than suitable for mounting on non-radial-axle types and of lengths up to 26 ft. over the body corner posts. It has been designed to interchange with any type of non-radial-axle truck with slight modifications of the car bottom framing and motor trap location, where the car body is of a length which would make it desirable to use the radial-axle principle. The "Radiax" E1 truck is built to carry a car at the same height above the track as the Brill No. 21-E truck.

**Manaos Tramways and Light Company.**—The tramway receipts amounted to £106,148, and the lighting to £44,148, against £109,718 and £35,602 respectively for the previous year. The result of the company's operation for the year is a surplus, after meeting debenture interest and sinking fund, of £28,107, which compares with £16,318 for the previous year. During the year under review £21,509 has been spent on capital account, the principal items being four new cars and certain additional track work. To the above-mentioned balance of £28,107 must be added the amount brought forward from the last account, making a total of £31,435. The directors propose to transfer to contingencies reserve, making a total to the credit of this account of £15,725 (after writing off an amount of £4,274), £10,000; to transfer to renewals reserve, making a total to the credit of this account of £21,000, £6,000; to pay a dividend on £300,000 ordinary shares at the rate of £4 per cent. per annum, leaving a balance to be carried forward to next year's accounts of £3,435. At the annual meeting on August 14 the chairman, Mr. I. M. Booth, reported that the company had been unable to recover from the State of Amazonas the debt of £23,676 due to them.

## PETROL-DRIVEN TRAMCARS.

### The "Simplex" System at Karachi.

At the present time, when tramways in general are being menaced by new forms of road vehicles, the annual report of the East India Tramways Company, showing the extraordinary success of the "Simplex" system of petrol tramcars as worked by that company at Karachi, should receive special attention. Before referring to the cars, which have enabled the company to obtain such excellent results, it will be interesting to trace briefly the history of the East India Tramways Company, in order to show their varied experiences, and their reasons for installing this type of traction.

The tramway concession for Karachi was obtained in 1882, and the main line of five miles laid in 1885, and subsequently a branch line two miles long in 1892. The tramway was at first equipped with small steam locomotives hauling first and second-class coaches. The locomotives, however, very soon succumbed to the trying conditions of continuous dust and bad fuel, and were within a year laid on the scrap heap. The company then resorted to horse traction with little better success, until the year 1901, when they were obliged to go into liquidation.

The company was, however, reconstructed, and the new company continued with the horses, improving the cars but making very little headway. About 1908 they were confronted by the problem of having to face the making by the Karachi Port Trust of a long and steep overbridge over which their main tram line had to be diverted. This would make their wavering horse traction still more difficult to work. Various forms of horse traction were then considered, and it was decided that the meagre traffic and short distances would not bear the heavy expense of electrification.

The company therefore determined to try the petrol engine, which was then proving itself very reliable for road transport. This was adopted in conjunction with the Dixon-Abbott patent transmission gear, and is now known as the "Simplex" system. The justification of the company's decision is proved by the running costs during the past four years, which are, we understand, the lowest on record for any type of similar passenger vehicle yet invented. This is further borne out by the steady increase in dividends paid out since the adoption of the "Simplex" cars. The deferred shareholders having received no dividend up to that time, received 1¼ per cent. on the first year, then 5 per cent. and 10 per cent., and this year a dividend of 5 per cent., with a bonus equal to 66⅔ per cent., has just been declared.

The cars employed are of the "Simplex" open type, with cross benches of curved wood slats, with which exception they might be termed as of the "all steel" category. The general view can be gathered from the accompanying illustration.

The cars are self-propelled by mechanism completely contained beneath the central seat, which is immediately removable by simply sliding backwards, thereby making the power unit easily accessible. This mechanism has now been reduced to the simplest possible form consistent with great durability and reliability, and comprises essentially a prime mover in the shape of an especially designed internal combustion motor, a clutch for connecting and disconnecting the motor from the transmission gear, and the transmission gear.

After much research work, and contrary to the usual automobile practice, it was found that the motor to give the best results was of the 2-cylinder type burning heavy petrol known as ·760 spirit, or benzine; it is fitted with the usual high-tension magneto ignition,

Digitized by Google

automatic lubrication, and positive water circulation. As this engine has a singularly steady torque over a very large range of speed, it is found practicable to run entirely on what is known by automobilists as "top speed," while the second or starting speed gear is only used for overcoming the initial moment of inertia of the car and for emergency cases. The shock of gear changes so noticeable on the motor omnibus and like machines is thus much reduced, and the jerk associated with the electric controller is entirely obviated. The design of the clutch necessarily aids this method of working materially. The clutch consists of male and female cone lined with a bonded fireproof substance, and operated by a system of balancing springs which prevent undue strain on the gear.

The transmission is the key-note of the whole system, and is manufactured under the Dixon-Abbot patent. It consists of parallel gear chains, enclosed in an absolutely oil-tight case, giving two-speed ratios with exceptionally few wheels and shafts, and it can be operated in either direction from either end. So simple and compact is this gear that it can be made of unusually large and durable dimensions, and yet is, with the engine and clutch, placed transversely across the centre of the car, so that the power is entirely transmitted to the road wheels through parallel shafts by means of a central heavy silent chain, thus displacing all bevel wheels and the necessity of taking the power round corners. The friction is therefore reduced to a minimum, and the efficiency is very high indeed; the petrol consumption of the whole fleet in service averaging 9 miles per gallon.

The effect of this centralisation of weight is to produce a very smooth and easy-running car, practically free from all vibration, and yet so robustly built that after four years' work it continues to be thoroughly satisfactory. It also has the effect of enabling a car weighing only $3\frac{1}{2}$ tons in working order to seat 46 passengers. It might be here mentioned in connection with the weight that the existing metals used by the former horse cars have proved sufficient for the petrol cars without shewing weakness at the joints.

The control is, according to usual tramway practice, from either end of the car, the driver standing behind the dashboard operating removable "fool-proof" levers, which are arranged so that it is impossible for any unauthorised persons to tamper with the non-driving end. It is possibly due to the position of driver and general appearance of the car, that something like nine-tenths of the population will insist that Karachi possesses an electric tramway.

In view of the great simplicity and light weight of the "Simplex" system, it is possible to understand how the East India Tramways Company (as shown in their annual report just published) were able to run during their past year 566,685 car-miles, at a total average cost of 2·19d. per mile for petrol, lubricating oil, repairs, and maintenance, while the total operating costs, including office expenses and full depreciation, averaged only 4·93d. per car-mile. This figure explains why the East India Tramways Company are able to make fares as low as one farthing profitable.

Both the operating company and the patentees (the Motor Rail and Tram Car Company, Limited, 79, Lombard Street, London, E.C.) may be fairly congratulated on this record result, and we shall not be surprised if in the near future this system is adopted in many places where roads bearing heavy traffic are difficult to maintain during all seasons of the year, except at very heavy cost, but where either tramways or light railways under this system could be made a financial success.

"Simplex" Petrol Car—East India Tramways Company.

**Lancashire and Cheshire Municipal Tramway Managers.**—A quarterly meeting of this Association was held at the Victoria Hotel, Manchester, on November 21, when there were present: Alderman Linsley, J.P. (president of the Municipal Tramways Association), Mr. J. M. McElroy (Manchester), in the chair, Messrs. J. Barnard (Bolton), F. Buckley (Wigan), W. Clough (Bury), A. T. Eardley (Stockport), R. R. Greene (Wallasey), Hosken (Darwen), E. Holt (Ashton), Barnes Kay (Haslingden), Mozley (Burnley), Smith-Saville (Darwen), Stewart (Rawtenstall), Simpson (Preston), Schofield (Stalybridge), Telfer (Warrington), and Holford (Salford), hon. sec. A paper was submitted by Mr. Smith-Saville (borough engineer, Darwen) on the subject of the "Maintenance of the Permanent Way," and an interesting discussion followed its reading. A very successful meeting terminated with hearty votes of thanks to Mr. Smith-Saville and to the chairman.

LONDON, DECEMBER 11, 1913.

**Profitable Uses for Omnibuses as Adjuncts to Tramways.**

Provincial tramway managers visiting London have been struck with the advantages the independent vehicle possesses for the institution of a through service at a high fare on tramway routes. So far as a double-deck conveyance restricted to a speed of 12 miles an hour can be considered to be an express it may be given that appellation, for in the congested central areas of the great towns its mobility will enable it to shake off the denser traffic. As at the most there would only be a half-way stopping place, it would be justifiable to charge the same fare for the half-way and full distances. No difficulty would be experienced in filling the conveyance, and in the winter season the number of such express omnibuses might be augmented by the employment of the vehicles set free owing to the lessened call at that season for their services on routes that during the summer constitute a profitable lengthening of tramway routes. This method would also provide a satisfactory solution of the problem of first-class tramcars, which need to carry ordinary fares on the top deck to render the service profitable. Another remunerative use would be for traffic after theatre performances. Two or three tramcars are often filled up on those occasions, and yet a number of people are left waiting for the following car. With one or two omnibuses in attendance, and bound for residential districts, full loads at a high fare covering all distances would certainly prove profitable. In addition to the motor omnibus enterprises already credited to Birmingham Tramways Committee, there are indications that Liverpool intends to conduct experiments with six additional omnibuses in so dense a traffic centre as the Pierhead, and in linking up the three railway termini, besides giving a service to another suburb. Powers are being applied for by Sheffield Corporation to run omnibuses in an extensive area outside of the city, but it is to be hoped that the enlightened management of the steel capital's tramways will not neglect to add their quota to the interesting reports that should result from the institution of such services as those we have indicated. As a linking-up factor the omnibus already plays a prominent part in both municipal and company tramways, and in the coming session of Parliament powers are to be asked for by 18 towns to adopt this means of locomotion. It is to be desired that they will not confine their selections to the double-deck vehicle, for the single-deck can be profitably used, especially for pleasure trips. Testimony of that fact is afforded by the report presented at the annual meeting of the Isle of Thanet Tramways Company on December 4, when the chairman mentioned that in order to meet the competition from omnibuses the company had hired two single-deck vehicles, which had already returned a profit.

---

**Goods Conveyance.**

Two or three causes have combined to direct attention once more to the question of instituting goods traffic on the tramways which link up the great centres of the cotton industry between Manchester and Liverpool. While Liverpool is suffering from the congested condition of its docks, Manchester is a victim to congestion in thoroughfares upon which warehouses abut. In Liverpool the railways have failed to provide adequate means of transport, and even the adoption of motor vehicles by numerous firms, who have taken to heart the lesson of railway strikes, has made little impression upon the holding up of goods, if we may judge by the complaints from traders. Cotton carriers between Oldham and Manchester

Digitized by Google

have to some extent adopted motor haulage, and the traffic in that district is so advantaged by the tramway tracks that the manager of the Oldham tramways was moved last year to submit to the local tramways managers' association a suggestion for transferring the traffic to the tramways. The idea of utilising the interurban lines of Lancashire and other counties for merchandise traffic emanated from the late Mr. C. R. Bellamy, then general manager of the Liverpool system, in the presidential address which he delivered to the Municipal Tramways Association in 1904. At that time he was engaged in the preliminary steps for the introduction of a service in the county, but the scheme failed to come to fruition owing to his death. Mr. Bellamy's work, if he had lived, would have interested tramway owners generally, for his idea was to cultivate, in the interests of agriculturists as well as manufacturers, the merchandise traffic provided for by the Tramways Act of 1870. It was for the benefit of the former that the Light Railways Act was passed after the sittings of the Royal Commission on Agricultural Depression in 1895-97. Mr. Bellamy was eloquent in describing how in almost every country but Great Britain light railways had become an essential factor in the prosperity of growers of agricultural, dairy, and general produce, their construction being facilitated by the Governments purchasing land at its agricultural value to enable roadways to be widened for the accommodation of light railways. Since that time we have had the Development Act passed, with the avowed object of providing transport facilities for agriculturists, and particularly for small holders. Yet all that the well-paid Commissioners have accomplished in three years is to appoint a gentleman to report on the question of light railways. Probably greater good would be derived from the Act if the sittings of the Commissioners, like those of the Light Railway Commission, were required to be held locally and in public. The suggestion for a goods service in Lancashire has now been ably elaborated by Mr. C. W. Mallins, the present general manager of the Liverpool tramways. While, as far as the city's existing lines are concerned, Mr. Mallins does not consider it practicable to run more than three or four trains per day, he has worked out plans that provide for additional tramway systems, etc., at an outlay of £273,750, or of a railless trolley car installation at an estimated cost of £190,400. These proposals are set out in full in this issue, and it is satisfactory to note that the chairman of the South Lancashire Tramways Company has expressed his readiness to co-operate in any scheme put forward for the transport of merchandise over his tramways.

---

**London Tramway and Omnibus Receipts.**

Party cries have been going up from some of the London daily newspapers about the change which has come over the position of the traffic receipts of the two great competitors, the London County Council Tramways and the London General Omnibus Company. Keeping clear of partisanship, however, the facts are pretty obvious, and reasons can be found for them. Let us take a few figures. For the 13 weeks ended December 28 last year the omnibus receipts amounted to £719,225, being an increase of no less than £230,135 as compared with the corresponding period of the previous year. This increase arose, of course, from the great additions to the number of omnibuses running and to the opening up of additional routes. On January 1 last 40 weeks of the tramway financial year had expired, and the tramway receipts for that period were £1,664,410, being a decrease of £82,820. The tramways were thus suffering from the omnibus competition to the extent of over £2,000 a week. A similar tale was revealed at the end of the 52 weeks on March 26 last, when the total tramway receipts were £2,151,925, a decrease of £104,039. The omnibus company had meanwhile changed their financial year so as to make it begin on January 1, and for the 13 weeks ended March 29 last their receipts were £706,780, being an increase of £194,146. Thus not only had the rate of increase already begun to fall off, but the aggregate for 13 weeks as compared with the 13 immediately preceding was less. Since then there has been further diminution as compared with the corresponding weeks of last year. The aggregate for the 48 weeks ended November 29, at £2,969,665, shows an increase of £505,673. This gives an average increase of about £10,000 per week, most of which was made early in the year. In some recent weeks the increase has been down to between £1,000 and £2,000. This

Digitized by Google

simply shows that the expansion from putting on additional omnibuses and opening up new routes has nearly reached its limit. The tramway figures show that the process of winning passengers from the tramways is also over. In the early summer the decreases compared with corresponding weeks began to diminish, but the aggregate decrease continued to grow till for the 17 weeks ended July 30 last the receipts at £731,738 showed a decrease of £23,272. Then the tide turned. Small increases began, and rapidly became larger, till for the 33 weeks ended November 19 the aggregate receipts at £1,406,434 actually showed an increase of £1,130. The increases promise to continue. They are to be attributed in part to the limit on omnibus expansion, but perhaps more to improvement in tramway organisation and traffic arrangements, to reductions in fares, and particularly to the extension of the system of cheap return tickets.

## DONCASTER CARS WITH PECKHAM TRUCKS.

The accompanying illustrations show two new types of cars supplied to Doncaster Corporation, one fitted with the Peckham single-axle radial truck with 13 ft. wheel base, and the other with Peckham 7 ft. 6 in. wheel base pendulum truck. The handsome bodies of the cars were built by the United Electric Car Company, Preston, while the Peckham trucks were made by the Brush Company, Loughborough. The following are the principal dimensions, etc., of the two types of cars:

| | | |
|---|---|---|
| Length over all .. .. .. | 32 ft. 6 in. | 28 ft. |
| Length inside body .. .. | 21 ft. | 16 ft. |
| Width over all .. .. .. | 7 ft. | 7 ft. |
| Width over floor sills .. .. | 6 ft. 1½ in. | 6 ft. 1½ in. |
| Height inside .. .. .. | 6 ft. 4 in. | 6 ft. 4 in. |
| Weight completely equipped .. | 13 tons 1 cwt. | 9 tons 18 cwts. |

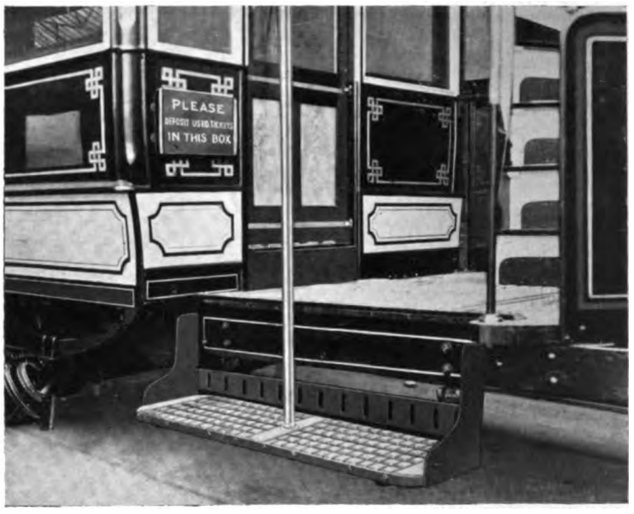
The seating capacity in the one case is 44 on top and 30 inside, total 74; and in the other 36 and 22, total 58. The wheels, which are 32 in. in diameter with 4½ in. axles for radial and 4 in. axles for pendulum trucks, have cast-steel centres and steel tyres. The hand brakes are worked by 20-in. diameter hand wheel, with Peacock's brake windlass gear under the platforms, and electric and track brakes are also provided. The collision fenders are of channel steel 6 in. deep, Hudson and Bowring life-guards are fitted, and the pedal sand boxes have Taylor's patent sanding device. There are two Dick-Kerr 40-H.P. motors per car, regulated by D.B. 1 form K.S. controllers.

The Peckham pendulum and radial trucks are of the same general construction as those supplied to the Southend Corporation, which were described and illustrated in our issue of February 6 last, except that the pendulum trucks are made with solid-forged side frames, and the radial trucks have an improved design of roller bearings and centre gearing that gives a free movement to the radial action of the axles. The special advantage claimed for the radial truck over maximum-traction trucks generally used, and with this length of car, is that it has 35 per cent. greater traction, consumes 30 per cent. less current, supports the car sills for 8 ft. at each end, instead of a 1 ft. centre support provided by centre-bearing maximum traction trucks, and costs 50 per cent. less to maintain.

Mr. E. S. Rayner, borough electrical engineer and tramways manager, says of the operation of these trucks: "The pendulum trucks have proved very satisfactory, the passengers expressing their approval of the comfort of riding on these trucks as compared to the old rigid axle-box type. With regard to the radial truck, it negotiates our curves with ease and returns to the parallel without any trouble."

## USED TICKET BOXES ON CARS.

In these days, when cleanliness and hygiene are made such important factors in public service, it is rather strange that the waste ticket box is not universally in vogue. Not only does it add to the cleanliness and tidiness of the car itself, but of the thoroughfares through which the car passes. Everyone has noticed the state of a busy terminus, littered and made untidy by tickets thrown down by passengers when alighting from the cars. This fact in itself is a good reason for the adoption of suitable receptacles on the cars into which the tickets may be put, but according to data furnished by one of the largest systems in the country,



Ticket Box Fixed to Car.

these ticket boxes have actually become a means of a new source of revenue. We cannot do better than quote from an announcement as to experience in Glasgow which appeared in our issue of February 6, last.

"With a total of nearly 7,000,000 tickets issued in the first week of the new year, little imagination is required to picture the condition of the cars and streets if passengers had not been trained to place used tickets in the boxes provided for that purpose. . . . . When the car reaches the depot at night, the boxes are emptied and the tickets are put into sacks and sold as waste paper to merchants. The yield is from a ton and a quarter to a ton and a half per week, and the proceeds suffice to defray the cost of fixing the ticket deposit boxes to the cars."

The accompanying illustration shows a form of ticket box which is in very successful use on some of the leading systems. Whilst it adequately fulfils its purpose, it is neat, and adds to the appearance of the car. It is made sufficiently shallow so as not to occupy useful space. It is built in mahogany, which in addition to giving good appearance is very strong and durable. The bottom of the box is hinged and fitted with a special form of spring lock with plug key, which can be readily handled by those in authority. The front of the box bears the inscription in gold letters: "Please deposit used tickets in this box." The Equipment and Engineering Company, 2 and 3, Norfolk Street, London, W.C., are the makers of these boxes.

## ADJUSTABLE WIND SCREENS FOR TRAMCARS.

With the object of protecting motormen on tramcars from the weather, the Equipment and Engineering Company, of Norfolk Street, Strand, London, have developed a special form of collapsible wind screen which can be easily adapted to cars with open fronts. The appearance of one form is shown in the accompanying illustrations. There are at present three types of these wind screens:

"A" type with three flaps to fold up backwards.
"B" type with four flaps to fold up frontwards.
"C" type with four flaps to fold up backwards.

The screens can, however, be made to suit any special requirements. The "A" type is especially suitable for cars having the destination indicator fixed under the canopy, but where the indicator is situated elsewhere, the space is usually filled in with a board with inscription such as "Circular Route," or "Via Market Place," etc.

The screens have advantages over the vestibule front, inasmuch as they can be folded up out of the way when not required during the summer months and when the cars are inside the depot. Special attention has been paid to the fixing brackets, and the screens can be erected in position by the ordinary tramway staff. They are not only effective and a safe means of protecting motormen on cars with open fronts, but are economical to install, reliable in service, and give a handsome and finished appearance to the car. An important feature of the screens is that they do not obscure the view of the motorman in rain and snow, and are not affected by street lights, as one flap is hinged and its angle is adjustable. When folded the screen is practically invisible.

Wind Screen Folded Up.

Wind Screen Lowered for Use.

## STATUTORY POWERS FOR QUEUES.

Section 30 of the London County Council's Tramways Act, 1912, gives that authority power to make by-laws requiring passengers waiting to board cars at any stopping place or terminus to wait in lines or queues, and to enter the cars in the order in which they stand. The Highway Committee have been in communication with the Home Secretary with a view to the framing of a suitable by-law, and the Home Secretary has now approved a by-law in the form in which the committee have submitted to the Council. This by-law states that on occasions when six or more intending passengers are waiting at any stopping place or terminus they shall form up in a line or queue two abreast, when directed by any officer of the Council, and no person shall take a place in the line out of proper order, or shall enter the tramcar out of the order in which he stands. The penalty is 40s.

**Mumbles Railway Electrification.**—It is understood that the scheme for the electrification of the railway between Swansea and the Mumbles will involve an expenditure of over £50,000. Mr. C. W. G. Little, chief electrical engineer of the British Electrical Federation, Limited, is advising the Swansea Tramways Company in the matter.

## LONDON AND SOUTH WESTERN RAILWAY
### SUBURBAN LINES ELECTRIFICATION.

THE HIGH-TENSION CABLES.

The contract for the supply and erection of the cables for the electrification of their suburban lines was placed by the London and South Western Railway Company with Messrs. Siemens Brothers and Company, Limited, Woolwich. The leading particulars are as follow:

Section of L. & S. W. Cable.

The three-phase current has a working pressure of 11,000 volts at a frequency of 25 cycles per second. The generating station is to be at Wimbledon, and sub-stations containing transformers and rotary converters are to be erected at Waterloo, Clapham Junction, Raynes Park, Hampton Court Junction, Barnes, Twickenham, Isleworth, Sunbury, and Kingston. The cables (Fig. 1) are three-core, paper-insulated, lead-covered, jute-served, and armoured with a layer of galvanised steel wires and served all over with jute.

The approximate quantities of three-core cable to be used are as follow:

34 miles 0·2 square inch.
21½ „ 0·15 „ „
19 „ 0·06 „ „

The chief particulars of the cables are as follow:

| Section. | No. of Wires. | Diameter of Wire varying from | Thickness of Dielectric between Conductors and between any Conductor and Lead. | Thickness of Lead. | Overall Diameter of Cable. |
|---|---|---|---|---|---|
| Sq. In. | | | Inches. | Inches. | Inches. |
| 0·2 | 33 | 0·06 to 0·114 | 0·36 | 0·16 | 3·17 |
| 0·15 | 33 | 0·054 to 0·11 | 0·36 | 0·15 | 3·01 |
| 0·06 | 22 | 0·048 to 0·068 | 0·35 | 0·13 | 2·65 |

The cables are being erected on brackets supported by stakes driven in the ground. They were subjected to a test pressure of 25,000 volts between any core and lead. The work is being carried out under the superintendence of Mr. Herbert Jones, M.I.E.E., chief electrical engineer to the London and South Western Railway Company.

Fig. 2 illustrates the first batch of finished cable before dispatch from Woolwich Works.

## TRAMCAR AND OMNIBUS INSPECTION.

In the report of the Commissioner of Police of the Metropolis for the year 1912, issued on October 31, it is stated that 249 motor omnibuses were rejected during the year by the Noise Committee, the vehicles not coming up to the standard required in respect to quiet running. Most of them, after the necessary alterations had been made, were subsequently brought up to the requisite standard and passed. The number of cases and the class of vehicles reported for being unduly noisy after being licensed during 1912 were: Motor omnibuses, 7,677; electric tramway cars, 2,684; and motor cabs, 353; a total of 10,714. This, compared with 1911, shows on the whole a slight decrease, motor omnibuses being 775 less, whilst electric tramway cars increased by 462 and motor cabs by 128.

The total number of licences issued for cabs and stage carriages during 1912 exceeded those issued in 1911 by 81, the numbers for 1911

Siemens' Cables for the London and South Western Railway.

Digitized by Google

and 1912 respectively being 16,476 and 16,557. Of this number, horse-drawn carriages again show a decrease, being 1,402 less than in 1911. This decrease is made up of 487 hansoms, 475 four-wheeled cabs, 410 horse-drawn omnibuses, and 30 horse-drawn tramway cars. Against these decreases must, however, be set a total increase of 1,483 in mechanically-propelled vehicles, made up of 343 motor cabs, 946 motor omnibuses, and 194 electric tramway cars.

The increase in the number of motor omnibuses is referred to as showing "that the popularity of this class of vehicle has by no means decreased. This continuance of popularity may also be due to the fact that many extensions of route have been made to places of resort in the outer part of the metropolis." Among the carriages licensed in 1912 there were 2,363 new vehicles, of which only three were horse drawn, the remainder being mechanically-propelled. The number of taximeters tested during the year was 24,623, of which 437 were rejected as being unfit from various causes.

Vehicles of all kinds killed 538 persons in the street—over a hundred more than in 1911. Of these, 331 were victims of motor vehicles of various kinds, the deaths of 167 being attributed to the motor omnibus. Tramcars were responsible for 37 deaths. Motor vehicles of all kinds injured 8,636 people, the motor omnibus being responsible for 2,580. The total number of persons injured by tramcars was less in 1912 than in 1911, while the number injured by motor omnibuses was doubled in the same period. Of the 538 killed in the streets, 273 were between the ages of 15 and 60.

## SUCCESS OF P-A-Y-E CARS AT ABERDEEN.

A Report Presented to the Aberdeen Tramways Committee by Mr. R. S. Pilcher, General Manager.

Gentlemen,—I beg to submit the following report on the P-A-Y-E cars which have been in use on the Woodside route since April 28—a period of 21 weeks. The Woodside route—on which the new cars have been on trial—is the busiest route the department operates, the revenue is the highest, and the passengers per car-mile are the highest (excepting only the Beach route). The city terminus of this route is the heaviest loading station for any one route on the system, so that it may be said that the P-A-Y-E system has been tried on that route which offers the severest conditions.

The objects of the P-A-Y-E system of car operation may be briefly stated as follow:

(1) To retain the conductor on the rear platform in order to assist passengers on and off the cars, to look out for intending passengers, and to prevent accidents to persons wishing to board and alight from the cars whilst in motion.

(2) To improve the regulation of traffic by the introduction of a separate entrance and exit, and to enable an additional front exit to be used.

(3) To enable the conductor to collect all his fares.

The success of any new system of car operation is influenced very largely by the attitude of the travelling public towards it. To operate P-A-Y-E cars successfully, it is necessary for the public to assist the department by having their fares ready on entering the car. I have found that the public have responded very willingly, and passengers have their fares ready before entering the cars. There has been a certain amount of criticism, which is only to be expected with any new system, but this criticism has been directed more to the details of the car, which can be remedied, than against the general principle of the P-A-Y-E system. The department has experienced no difficulty with giving change for silver. On the ordinary cars the amount of silver to be changed is 10 per cent., but this has dropped to below 5 per cent. on the Woodside cars.

With regard to the loading of cars at a busy terminus, or for any special event, the P-A-Y-E cars will, no doubt, take slightly longer to load, but these cars will save time at every stopping place *en route*, partly by the use of the front exit, and also by the prompt starting signal which the conductor is able to give the motorman from his position on the rear platform. I am able to give you the average time occupied by the complete trip on two Fridays—one on the old system and the other on the P-A-Y-E system—showing an advantage in favour of the P-A-Y-E cars, although the number of passengers carried and revenue earned was higher, thus causing more stoppages on the P-A-Y-E cars:

| | Date. | Market Day. | Average Running per Journey between 2-0 and 5-30 p.m. | Passengers per Car-Mile. | Receipts per Car Mile. | Total Receipts for the Day. |
|---|---|---|---|---|---|---|
| | | | | | d. | £ s. d. |
| Ordinary system ... | Mar. 14 | Friday | 35·1 min. | 11·42 | 10·8 | 45 16 8 |
| "P-A-Y-E" system | May 16 | Friday | 34·2 min. | 12·41 | 11·66 | 49 18 2 |

The question of accidents is one of great importance to a tramway system. It is not only the amount of compensation, but the question of safe conveyance for the public. Arrangements should be made, where possible, to prevent accidents. During last year the number of accidents reported on the system was 309, of which the greater number were of persons either attempting to board the cars, or alighting, whilst the car was in motion. In some cases the conductor was there to allay the seriousness of the accident, but in many cases he was engaged collecting the fares, inside or on the top of the car. For your information, I enclose a copy of a typical accident of this kind, from which you will see that the passenger fell off the car and was not even seen by the conductor. Such accidents are impossible with the P-A-Y-E system. The motorman does not open the front gate until the car is at a standstill, and the conductor prevents persons alighting from the rear platform until the car has stopped. During the period of trial two accidents have been reported owing to persons jumping off the rear platform whilst the car was in motion; both of these would have been more serious had the conductor not endeavoured to prevent them. During the same period last year, with the ordinary cars in use, seven accidents were reported of the same type. If all the department's cars were operated on this principle, one can imagine the reduction in this type of accident which would take place.

The prepayment of fares has a direct influence on the finances. Any person who studies the conditions of present-day tramway traffic must prove to himself that a conductor—no matter how conscientious he may be—cannot collect all the fares and attend to his other numerous duties.

I have kept the committee informed, by the weekly traffic returns, of the progress of the P-A-Y-E receipts. The total increase for the 21 weeks is £487 0s. 6d., an average of £23 3s. 10d. per week. During this time 4,804·8 more miles have been run. I should have been quite prepared for a decrease in receipts per car-mile owing to this, but the receipts per car-mile have increased from 11·3d. in the same period last year to 11·7d. this year. A great deal of the extra revenue is due to the prepayment of fares, and to the fact that the conductor is in a better position to see all intending passengers.

During the past five months I have given close personal observation to the P-A-Y-E cars. These cars have had to deal with the Agricultural Show traffic, on which day the ordinary cars were, in some cases, too crowded to collect all the fares, whereas the P-A-Y-E cars required no checking; and on another occasion—that of the "Timmer Market"—thousands of children were carried without any delay, whereas the cars on other routes were, in many cases, running late.

I have no hesitation in recommending the P-A-Y-E cars to the committee as an improved method of tramway operation by which greater public safety can be obtained.

The number of P-A-Y-E cars in operation on the Woodside route at present is 11, leaving 47 top-covered cars of the ordinary type. The cost of altering this type of car would be £30 each; the cost of altering the open cars would be considerably less than this.

Should the committee decide to adopt the P-A-Y-E system on all the routes, the cost of alteration would be spread over several years, the time required for alteration being from two to three weeks, and as each car is altered its earning capacity will be increased.

On the last car altered a considerable improvement has been made on the stairway, which is now easier to mount than any of the ordinary cars. The top-deck arrangement of screen has also been improved so as to allow an easier exit for passengers.

## ABERDEEN CORPORATION TRAMWAYS.

### Accident Form.

Every case of injury to person, damage to property, vehicles, etc., must be reported to the general manager at the earliest possible moment. It must be written in ink, and signed by the driver and conductor. Full information and the names and addresses of witnesses must be given in every case, failing which, the driver and conductor will be held equally responsible for damages, etc.

No. of Accident—3,314.

Day—Thursday; date—1st May; time—2-20 p.m.

### Full Statement of what Happened.

While Car No. 42 was proceeding along King Street towards Castle Street, a passenger attempted to leave the car while in motion and fell. I did not see the accident, nor knew anything about it, as I was on top-deck collecting my fares. A policeman informed me about the accident an hour after. I remember three passengers who travelled inside the car that journey from Merkland Road, and they did not see the accident.

# CONVEYANCE OF GOODS ON LIVERPOOL AND CONNECTING TRAMWAYS.*

By Mr. C. W. Mallins
(*General Manager of the Liverpool Corporation Tramways*).

There is no precedent in this country for the adoption of goods service on tramways, as none of the British tramway authorities have attempted to utilise their systems to any great extent for such a purpose. The question, however, appears to be of such vital importance to the trade of the port and the city of Liverpool that every effort possible should be made to increase the transport facilities, particularly bearing in mind the difficulties which the mercantile community are at present experiencing in connection with the transport of merchandise. A cheap and expeditious system would, undoubtedly, prove a great advantage to the whole community, and might possibly encourage even a greater volume of trade to the port.

One cannot survey the whole aspect of the traffic problem at the Liverpool docks to-day without being amazed at the wonderful increase in the tonnage entering and leaving the port as compared with 30 years ago, at which period the Alexandra and other docks were opened for public traffic at the north end of the city, giving ample facilities for dealing with the shipping of the port at that time. In the year 1882 the tonnage entering and leaving the port of Liverpool amounted to 16,208,272 tons, whilst in 1912 it had risen to 34,654,830, or an increase of 113 per cent. in 30 years. The land transport facilities of 30 years ago have been considered ample, but the great development in steamship construction, both as regards speed and carrying capacity, of late years appears to have overwhelmed the resources of the transport facilities, causing the present congestion at the docks and stations. The great carrying companies find themselves unable to cope satisfactorily with the ever-increasing dock traffic, and it therefore follows that, if the Liverpool tramway system could be made to assist in dealing with this congestion, it would indeed play a useful part, and the railway companies would appreciate such assistance, because, after all, the tramways should become a very useful adjunct to the railways.

The traffic congestion problem as it stands at present may be divided under two heads:

(1) *Local Traffic between Docks and Railway Stations and Warehouses.*—A great portion of this traffic is dealt with by horse traction, entailing the use of a very large number of vehicles, which must necessarily be of small carrying capacity, and can only move at a slow rate, and consequently increase the congestion on the limited quay space and roads adjacent to the docks and stations. In 1912 the number of horse vehicles is given as 11,000, and mechanically propelled vehicles, 124, in addition to the line of dock railway which operates between the dock quays and railway stations. Even making due allowance for the greater carrying capacity and mobility of the 124 mechanically-propelled vehicles, the local transport accommodation can hardly be said to have kept pace with the increasing trade in the latter years of the period under review. Hence the present congestion, although no one would for one moment attempt to minimise the great service rendered to the commerce of the port and city by the forwarding agents and master carters with their admirable system of animal traction—no doubt the finest of its kind in the world—but the scientific development and rapid flow of the tide of progress of the twentieth century must surely render obsolete even the best system of animal traction. The general manager is of opinion that, if a thoroughly well organised system, equipped with the most modern type of mechanically-propelled vehicles—possibly of the electric storage battery type, with a cheap power supply—were provided to deal with the work now carried out by the horse vehicles, the work could be performed by 50 per cent. fewer vehicles, which would materially lessen the congestion, and it is reasonable to assume that the work would be carried out at a much lower cost, thus solving the local portion of the problem. The general manager, however, does not consider it necessary to enter into the details of a scheme on these lines, as, no doubt this suggestion will have the consideration of those responsible in the matter.

(2) *The Transport of Merchandise between the Docks and the Manufacturing Centres.*—The facilities offered by the railway companies do not appear to be adequate for the requirements, as it is alleged that delays frequently occur in transit causing serious inconvenience and consequent loss, and, in addition, the rates charged are considered excessive, but the greatest difficulty appears to arise from the slow delivery of the goods. The railway companies seem to experience much difficulty in dealing cheaply and expeditiously with the great volume of trade which the country is now happily experiencing. The facilities, so far as the port of Liverpool is concerned, do not appear to have been increased in the same ratio as the trade, which probably accounts for the present congestion.

Through the courtesy of an old and highly-esteemed firm of cotton merchants, the general manager is able to furnish the following rate charged per ton for the conveyance of both American and Egyptian cotton between the Liverpool Docks and Bolton, Lancashire, a distance of 32 miles, viz., 8s. 4d. per ton, exclusive of all terminal charges, which works out at 3¼d. per ton-mile. The charges for the transport of other merchandise vary according to the class of goods.

Having regard to the foregoing facts, it is not surprising that the merchants and traders are anxious to discover a cheaper and more expeditious system of transport, and naturally look to the tramways in order to ascertain whether the system could be utilised for the purpose. The general manager is not unmindful of the great advantages to be derived from the establishment of a cheap and expeditious system of transport for goods, nor is he oblivious to the difficulties which would have to be surmounted before such a system could be brought into operation. The first consideration must necessarily be as to what facilities the Mersey Docks and Harbour Board are prepared to grant to enable any new system of transport to enter the dock estate, which is undoubtedly the key of the position so far as the solution of the docks traffic problem is concerned.

With regard to the question of utilising the existing tramways for the conveyance of goods, the general manager has carefully considered the subject, and he is of opinion that it is quite impracticable to operate a goods service of any magnitude over the existing lines. The Knotty Ash and Pier Head route is the only one which has a connection with tramways outside the Liverpool system, and the general manager would point out that the passenger traffic on this route is very heavy, necessitating a very frequent service of cars between the hours of 4-30 a.m. and 12-30 midnight. At the maximum time of traffic, cars run at intervals of every 1½ minutes, and at the minimum every four minutes. It will therefore be seen that it would be quite impossible to operate a goods service over this route in addition to the passenger service before mentioned, except for a limited number of hours in the early morning, and the fact must not be overlooked that repairs have to be carried out, both to the track and overhead equipment, during these hours. In the opinion of the general manager it would be quite impracticable to attempt to utilise any of the existing lines in the central area of the city for the transport of merchandise on any considerable scale, as they are at present taxed to their utmost capacity in dealing with the passenger traffic, which is every day becoming a more pressing problem, and one which it will be necessary for the committee to seriously consider in the not distant future. The general manager would therefore point out that the most that could be done with the existing lines would be to try a system of goods transport tentatively on a very limited scale, say three or four trains per day, entailing a comparatively small capital expenditure, and, if found successful, a more elaborate system could be established on the following lines, provided that the Mersey Docks and Harbour Board, and the Bootle Corporation are prepared to grant the necessary facilities, and further, that the merchants and shippers give their full support to the scheme, by guaranteeing a traffic of at least 1,314,000 tons of merchandise per annum from and to the docks, at, say, 2¾d. per ton-mile by the new system, exclusive of terminal charges, providing a revenue amounting to £105,394 per annum, which would cover the operating expenses and standing charges, and also reserve, renewal, and depreciation, and allow a reasonable margin for other contingencies. It is quite probable that a considerable volume of mineral traffic and farm produce would be transported by the new system, which would materially help in securing the necessary guarantee to cover the charges before referred to.

The permission of the Mersey Docks and Harbour Board to electrify the dock railway, with the necessary connections, as shown on the accompanying plan marked "A," section 1, would have to be obtained, the total length of which is 22 miles single line, and the approximate cost £154,000. In this connection it might be considered desirable to lower the level of the portions of the railway abutting on the approaches to the landing stage, from the street level to a shallow tube, and by that means obviate a great deal of the obstruction that now takes place in connection with the operation of the railway, the cost of which is *not* included in these estimates.

In the alternative, if it were considered impracticable to electrify the dock railway, the construction of a line of tramways parallel with the railway, outside of the dock estate, in the public streets, with the necessary connections to the dock estate, and as shown on the accompanying plan, marked "A," section 2, the total length of which is about 22½ miles single line, and the approximate cost £157,500.

The construction of a tramway to deal with the North Docks traffic, between Alexandra Dock and Knotty Ash terminus, as shown on the accompanying plan marked "A," section 3, would also be necessary, the length of which is about 7¾ miles single line, including passing places, and the cost would approximately be £54,250. The consent of the Bootle Corporation would, of course, be necessary before this line could be constructed.

The construction of a tramway for the purpose of dealing with the South Docks traffic between Brunswick Dock and Knotty Ash terminus would also be necessary, as shown on the accompanying plan marked "A," section 4, the length of which is about five miles single line, including passing places, and would cost approximately £35,000.

With these connections it would be possible to operate a service of

CONVEYANCE OF GOODS ON LIVERPOOL AND CONNECTING TRAMWAYS.

Digitized by Google

trains, consisting of one motor and two trailer wagons, for which the Board of Trade would be prepared to grant provisional authority. These trains would have a total carrying capacity of 25 tons each, and would run at intervals of every 10 minutes on each of the branch lines, making a total of 288 trains per day, capable of conveying 7,200 tons of goods, or a total of 2,628,000 tons per annum to the city boundary. In order to equip these lines to their full capacity the following would be the appoximate rolling stock necessary: 36 motor vehicles and 72 trailer wagons, but as the South Lancashire Tramways Company's system is only capable of dealing with about 144 trains per day, it would not be necessary to purchase the whole of the rolling stock until the company increased the capacity of their system, which the general manager is given to understand they are prepared to do if the result of an experiment warranted the expenditure. 14 motor vehicles and 28 trailer wagons would be capable of conveying 3,600 tons per day, or 1,314,000 tons per annum, and, with spares, would cost approximately £22,000. This instalment of rolling stock would be sufficient to establish the system and could be increased as traffic developed. In order to provide the necessary shed accommodation, another £5,000 must be added. The South Lancashire Tramways Company and other undertakings would, of course, provide their own portion of the rolling stock. Adding these latter sums for rolling stock and shed accommodation to the sums already mentioned for the construction of lines, the total capital expenditure would amount to £273,750, and an annual sum of £90,655 would be required for operating costs and standing charges, and reasonable allowance for renewal and depreciation, viz.:

ESTIMATES OF ANNUAL EXPENDITURE AND INCOME

(based upon the minimum working of 144 trains per day).

| | £ |
|---|---|
| *Traffic:* | |
| Superintendence | 600 |
| Wages of motormen, conductors, and other employees | 9,000 |
| Cleaning and oiling vehicles | 1,424 |
| Cleaning and sanding track | 250 |
| Fuel, lighting, and water for depots | 200 |
| Uniform for employees | 500 |
| Miscellaneous charges | 1,000 |
| | £12,974 |
| *General Charges:* | |
| Permanent way | 9,000 |
| Electrical equipment | 1,500 |
| Buildings and fixtures | 120 |
| Workshop and tools | 50 |
| Motor and trailer wagons | 2,280 |
| Power expenses | 20,000 |
| General and management expenses (including rates and taxes) | 5,000 |
| Interest and sinking fund | 17,800 |
| Renewal and depreciation | 13,690 |
| | £82,414 |
| Add 10 per cent. for contingencies | 8,241 |
| Compensation and law charges (not ascertainable) | |
| Total estimated expenditure | 90,655 |
| Total estimated revenue | 105,394 |
| Balance | £14,739 |

The above-mentioned sum for capital expenditure is exclusive of the cost of counting-house facilities, which would certainly be necessary if the system were carried out on a large scale, and the provision of a gridiron at the city boundary, Knotty Ash, where the goods trains would be taken over by the South Lancashire Tramways Company.

The general manager has gone carefully into the question of running a service in conjunction with the South Lancashire tramways, which undertaking has connection with several Lancashire towns, as shown on the accompanying plan marked "B," and by building a certain length of tramways, connection could be established with several Yorkshire towns, which, like many of those in Lancashire, are connected by various tramway systems. Unfortunately, if ordinary tramways were adopted, in some of the systems the track is not of the standard gauge, but this difficulty could be surmounted by certain mechanical arrangements. If the trackless system was adopted, however, this difficulty would not exist. The chairman of the South Lancashire Tramways and the Prescot Light Railway (the Hon. Arthur Stanley, M.P.), at a recent interview with the chairman and deputy-chairman and general manager, stated that he would be prepared to co-operate with the committee in any scheme they might bring forward for the transport of merchandise over his system.

From the foregoing figures it is quite obvious that to introduce a system of any magnitude for the transport of merchandise by ordinary tramways would involve a large sum in capital expenditure, in order to construct and equip the necessary lines, and having regard to this fact the general manager thought it desirable to consider the practicability of the trackless trolley system as an alternative, although, like the ordinary tramways, this system has not been adopted to any extent in this country for the conveyance of goods, but after some enquiry into the matter, he is informed by certain of the promoters of the trackless trolley system that it is quite practicable for the transport of goods, and could be established at a cost of £1,700 per route mile, including all charges other than rolling stock, as compared with £7,000 per mile of single track for ordinary tramways, or a total sum of £40,800 for the construction of the 24 route miles required, as compared with £246,750 for the same length of ordinary tramways. Before the system could be established, however, it would be necessary to obtain Parliamentary powers, which would involve certain further expenditure. This, together with other charges, would amount to, say, another £4,000, or a total of £44,800, and in order to equip the lines with the necessary rolling stock to convey the quantity of merchandise necessary to cover the operating costs and standing charges for the first instalment 24 trains would be required, costing £1,900 each, or a total of £45,600, with an additional sum of £10,000 for spare trucks and shed accommodation. Adding this sum to the amount already mentioned for the erection of overhead lines and other equipment would make a total of £100,400, with an annual sum of £78,136 for operating costs and standing charges, also renewal and depreciation, and in order to safely provide this sum, it would be necessary to have a guarantee from the merchants and shippers that they would be prepared to transport 1,314,000 tons from and to the docks at, say, 2½d. per ton-mile, exclusive of terminal charges, amounting to £95,812. This extremely cheap rate per ton-mile is possible owing to the comparatively small capital expenditure necessary to establish the trackless system.

So far as the general manager has been able to ascertain, the operating costs and standing charges would be as follow, viz.:

TRACKLESS TROLLEY SYSTEM.

ESTIMATES OF ANNUAL EXPENDITURE AND INCOME.

| | £ |
|---|---|
| *Traffic:* | |
| Superintendence | 600 |
| Wages of motormen, conductors, and other employees | 10,850 |
| Cleaning and oiling vehicles | 1,640 |
| Fuel, light, and water for depots | 200 |
| Uniform of employees | 550 |
| Miscellaneous charges | 1,000 |
| | £14,840 |
| *General Charges:* | |
| Electrical equipment | 1,500 |
| Buildings and fixtures | 120 |
| Workshop and tools | 50 |
| Maintenance of vehicles (steel tyres) | 11,169 |
| Power expenses | 20,000 |
| General and management expenses (including rates and taxes) | 5,000 |
| Interest and sinking fund | 10,322 |
| Renewal and depreciation | 8,032 |
| | £71,033 |
| Add 10 per cent. for contingencies | 7,103 |
| Compensation and law charges (not ascertainable) | |
| Total estimated expenditure | 78,136 |
| Total estimated revenue | 95,812 |
| Balance | £17,676 |

The tonnage mentioned above would be required to cover standing charges and operating expenses, but the system would be capable of dealing with 2,628,000 tons per annum, equal at 2½d. per ton-mile to £191,625 per annum, which would make it extremely cheap to the merchants and profitable to the operators.

On making a comparison between the cost of constructing an ordinary tramway and the trackless trolley system, it becomes quite clear that the latter system is infinitely cheaper to construct, and if the statements made by the promoters are correct, would be found equally as efficient for the purpose, and would possibly prove more flexible in dealing with the problem before the committee, but before the general manager could recommend the system, he would require the promoters to demonstrate to his satisfaction the practicability of the system in actual working.

The whole of the figures quoted in this report are approximate, but ample provision is made to cover every item of expense mentioned.

The general manager has not included the cost of collecting and distributing depots, as he does not consider them necessary in connection with the Liverpool portion of the scheme, as this would only deal with the traffic between the docks and the city boundary at Knotty Ash, where, if the scheme developed, a gridiron and sorting depot would be necessary as before referred to. No doubt collecting and distributing depots would be necessary for the other tramway undertakings, who would deal with the traffic beyond the Liverpool boundary.

# COMPOUND GUARD RAILS FOR CURVES.*

By M. Janillon

(*Chief Engineer of Permanent Way and Construction, Compagnie Générale Parisienne de Tramways*)

and M. Le Bris

(*Chief Engineer of Technical Services, Compagnie Générale Française de Tramways*).

The wear of rails on curves of short radii at certain places where the traffic is heavy is so severe that these rails have to be replaced after an extremely short life. The sections reproduced in Fig. 1 show the deformation of rails in from 12 to 18 months only. The inside rail, owing to its position and to the thinness of the lip or check, is first worn out. On certain curves this lip became so thin that it suddenly bent over, and derailment occurred. These sections show that the tread of these rails is comparatively but little worn. Moreover, attempts have been made to prolong their life by reducing the gauge. This resulted in such serious wear of the outer rail that it had to be renewed after an unusually short time. In addition to the danger of derailment, the rapid wear of the curves entails heavy expense, viz. :

1. The renewal of the rails and the repairs of the roadway (which in certain cases is extremely costly).
2. The packing, which has to be done to the seat of the rails. This must be carried out properly and without interruption of the services, and almost always without temporary tracks.

In order to remedy these disadvantages, the Commission which inquired into the matter on behalf of the Tramways and Light Railways Union of France, proposed to the committee of the Union that a special rail should be used with a lip slightly reinforced. This arrangement, which affords certain advantages, can, however, only be considered a temporary expedient. On curves under heavy traffic it does not form a complete and final solution of the question. In the majority of cases this would appear to be found in the use of a special rail fixed on the convex side of the inner rail—the part of the rail which serves to guide the car, and is consequently rapidly worn out—which could be replaced after a certain degree of use in order to protect the outer rail; or be easily replaced when worn out and useless.

Other considerations must be taken into account; for instance, it is indispensable that the special rail should be as similar as possible to the normal rail, particularly in the following points:

(*a*) in form of tread;

(*b*) in its attachment either to the foundation or to the main rail;

(*c*) in the general lay out of the road;

(*d*) in its fitting adjacent rails, by means of the ordinary fish plates, so as to avoid the use of special fish plates, which are often unsatisfactory.

* A report presented by a Commission of the General Technical Conference of the Tramways and Light Railways Union of France, and adopted by the Union. The members of the Commission were as follow: M. Resal (president), MM. Broca and Holtzen (vice-presidents), MM. Bacqueyrisse, Conchaudon, Delavergnas, Domblides, Finn, Gadot, Janillon, and Le Bris.

On the other hand, it is indispensable that the piece which wears out should be also as small as possible, in order to reduce to the minimum the expense of renewal. It is evident that the piece, being reduced to the minimum, should be of the best metal, in order to minimise the expense of removal and replacement.

Finally, it is indispensable that the work of shifting or renewal of the movable pieces should be effected without the slightest change in the seat of the rail. From these considerations it may be concluded that the special rail for curves must be formed of two pieces, the supporting part immovable, and the renewable piece of small dimensions easily replaced and fixed upon the first. The immovable piece supports the weight of the cars; the other, which serves as a guide, supports only the lateral thrust, but it must in addition be strong enough to bear the ordinary traffic.

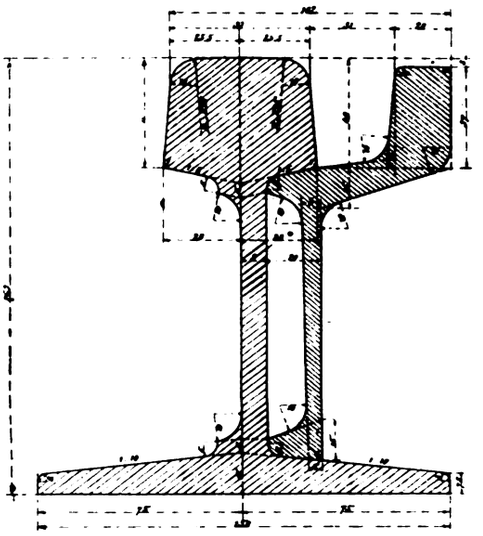

Fig. 2.—Section of the Haarmann Rail.

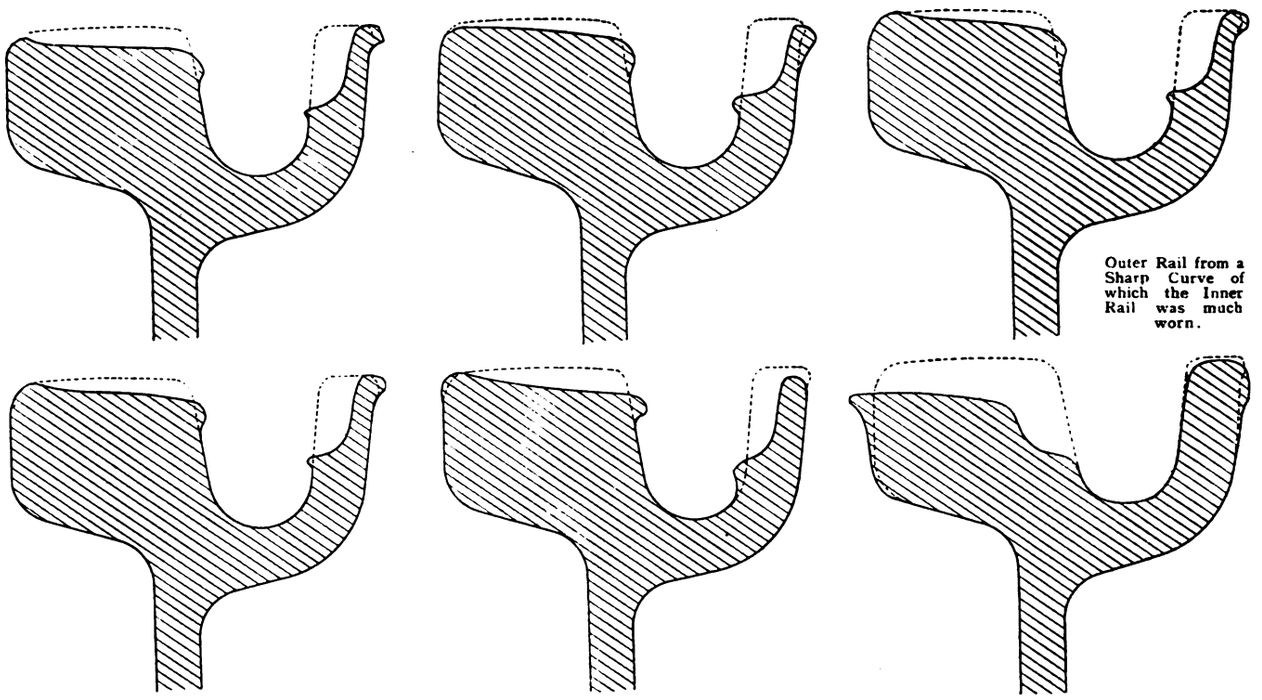
Many types of double rails are in use. Among them are the following:



Outer Rail from a Sharp Curve of which the Inner Rail was much worn.

Fig. 1.—Deformations of Inner Rails from Sharp Curves.

I.—The Haarmann Rail (Fig. 2).

This rail has the following disadvantages where, as in the case of our companies, not only is the U.T.F. (Union de Tramways de France) rail being adopted, but it is intended to generalise its use.

Fishing to the Broca U T.F. rails with the normal fish plates is impossible. Tie-bars are considerably altered. Under this arrangement there is no allowance for play, so that only the increased thickness of lip can be depended on; when this wear has attained a certain

Digitized by Google

depth the attack on the outer rail will begin, and its deformation will become so serious that when the check rail has been renewed (the thickness of which is considerable) the outer rail also will have to be renewed.

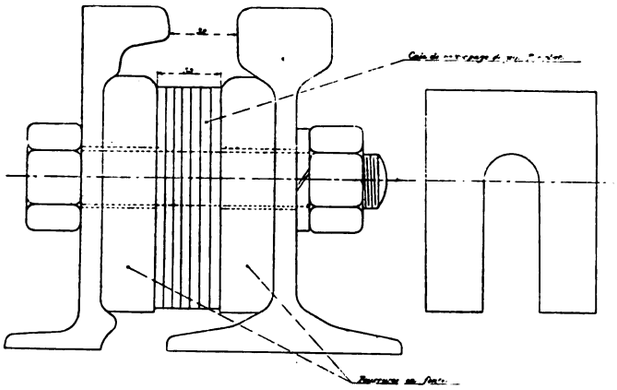


Fig. 3.—The Brussels Type of Rail.

Lastly, a serious cost is involved in renewing this check rail, as its weight is considerable, and it cannot be put to any other use.

II.—The Brussels Rail (Fig. 3).

In order to lay this down a type of Vignoles rail would have to be adopted which would work in with the Broca U.T.F. rail. The sketch (Fig. 4) given herewith shows that this junction is difficult, without, however, being impossible.

However, granting that such a Vignoles rail can be procured and that a Brussels type check rail is used which can be worked in with

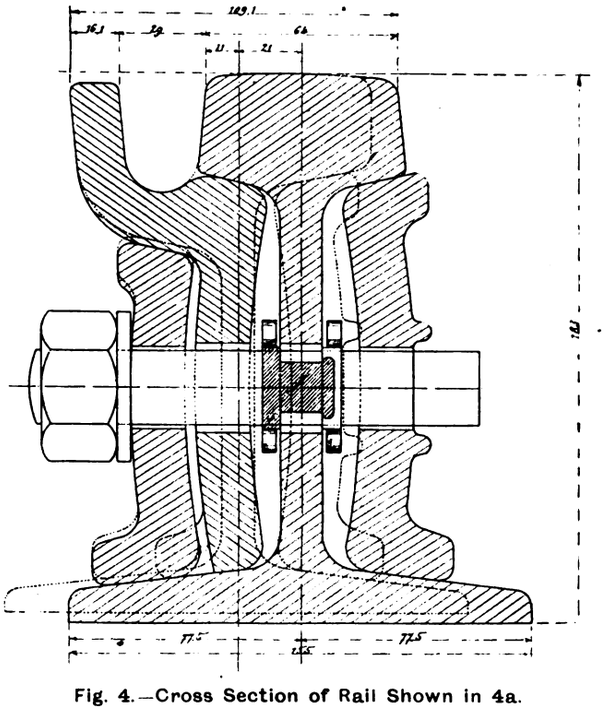

Fig. 4.—Cross Section of Rail Shown in 4a.

fastenings; the importance in weight and size of the part to be renewed; moreover, the check rail is not well seated; this is a serious disadvantage, as the passing of the ordinary road traffic might shift it.

The principal advantage of this arrangement is that the check rail can be brought closer to the running rail, when the former has been worn to a certain extent, owing to the provision of liners.

As a matter of fact, an allowance for play in any form is too difficult and complicated to be of any practical advantage.

III.—The Bordeaux Rail (Fig. 5).

This design is more satisfactory, as it fulfils some of the conditions laid down above. As a fact, the movable piece on which the wear,

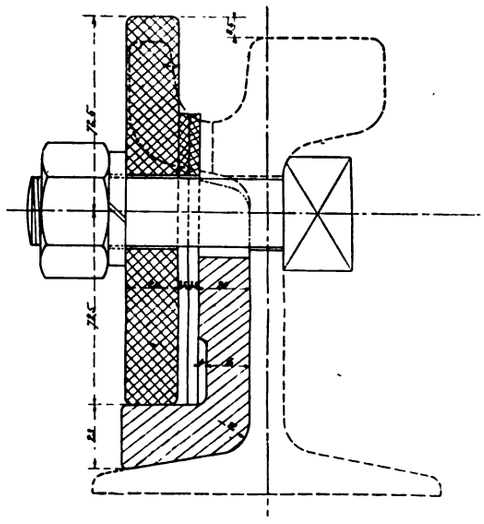

Fig. 5.—The Bordeaux Type of Rail.

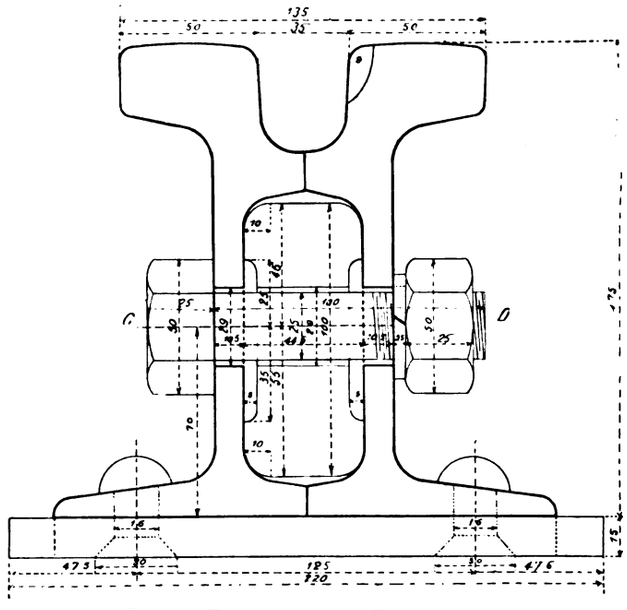

Fig. 6.—The Marseilles Type of Rail.

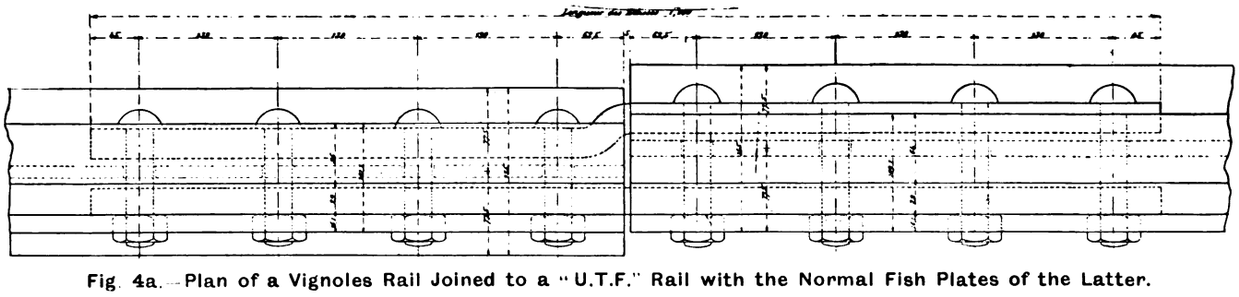

Fig. 4a.—Plan of a Vignoles Rail Joined to a "U.T.F." Rail with the Normal Fish Plates of the Latter.

this Vignoles rail, the following disadvantages would still remain: Impossibility of joining the ends of the special rail to the adjacent U.T.F rails except by almost entirely altering the normal fastenings; the difficulty of paving owing to the projection of the bolts and of the

due to the friction of the tramcar wheels, takes place is a very simple one, and owing to its symmetrical shape it can be turned and used again. The fishing to the adjacent rails is quite easy, as the support consists of an ordinary Broca rail (except, however, where the joint is

Digitized by Google

in the middle of a curve). The only additional piece, the cast-iron packing piece, is not subject to wear. It may as well be pointed out that the liners between the packing piece and the thickened check rail are not designed to allow for play; they serve only to regulate the gauge. This system has the disadvantage of seriously altering the normal fastenings; moreover, the considerable projection of the bolts for fixing the thickened check rails interferes to some extent with the laying of the paving.

IV.—The Marseilles Rail (Fig. 6).

As shown by the drawing, in this design two grooved rails are joined together, from which have been previously removed the lip and part of the bottom flange. The joining of these two parts is effected by means of a seat or bearing plate riveted to the two bottom flanges. In addition, between the inside faces of the web there is inserted a shaped cast-iron filling piece, the whole being strongly held together by bolts.

Although fishing is possible at the ends of curves, it will be seen that the fastening or bracing is altered extensively. Moreover, the check rail is of larger section.

V.—The Bulfin Rail (Fig. 7).

This very interesting system is also employed on the Marseilles tramways. It consists of replacing the worn out small lip, cut off by a blow-pipe, by a new wing rail of special shape which can be fastened

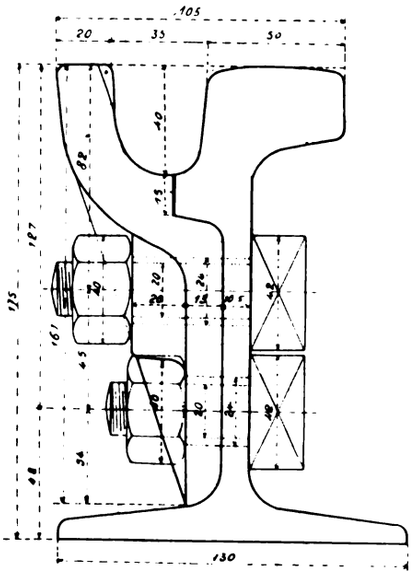

Fig. 7.—The Bulfin Guard Rail.

to the web of the rail. This new check rail is of manganese steel. The fishing of ends is possible, and on curves can be effected with ordinary fish plates and the thickened check rail; and the normal fastening has to be but slightly modified. On the other hand, the curved pieces which form the check rail are delivered in 1½-metre lengths, so that there are a great number of joints, which has a detrimental effect on car wheel tyres.

VI.—The Holt Rail (Fig. 8).

This design fulfils best of all the conditions we have enumerated as essential to a satisfactory compound rail in two parts. Moreover, it

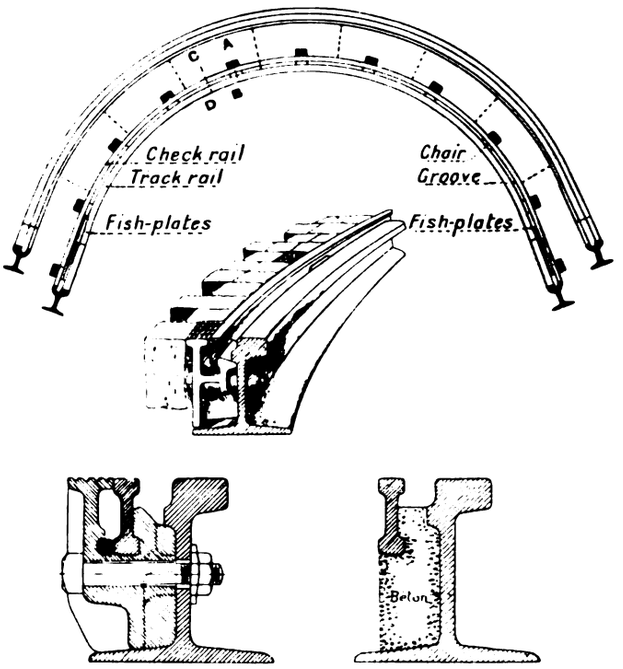

Fig. 8.—The Holt Guard Rail.

has been in use for a certain number of years in Leeds, and it would appear that the results obtained have been very satisfactory.

VII.—Design Proposed by One of the Members (Fig. 9).

The present U.T.F. rail would be altered as follows:

The lip, which is vertical in the U.T.F. rail, would be bent over horizontally, and on this extended lip a rectangular bar would be fixed of a predetermined section and quality. This bar would act as the check rail. The section of this compound rail would be such that no change would be necessitated in the fish plates, or in any fastening or anchorage of the U.T.F. rails at present in use. The rolling of the proposed section would be all the easier, as in some mills the U.T.F. rail is formed with this particular section; it is only during the last two passes that the lip, at first horizontal, is raised to a vertical

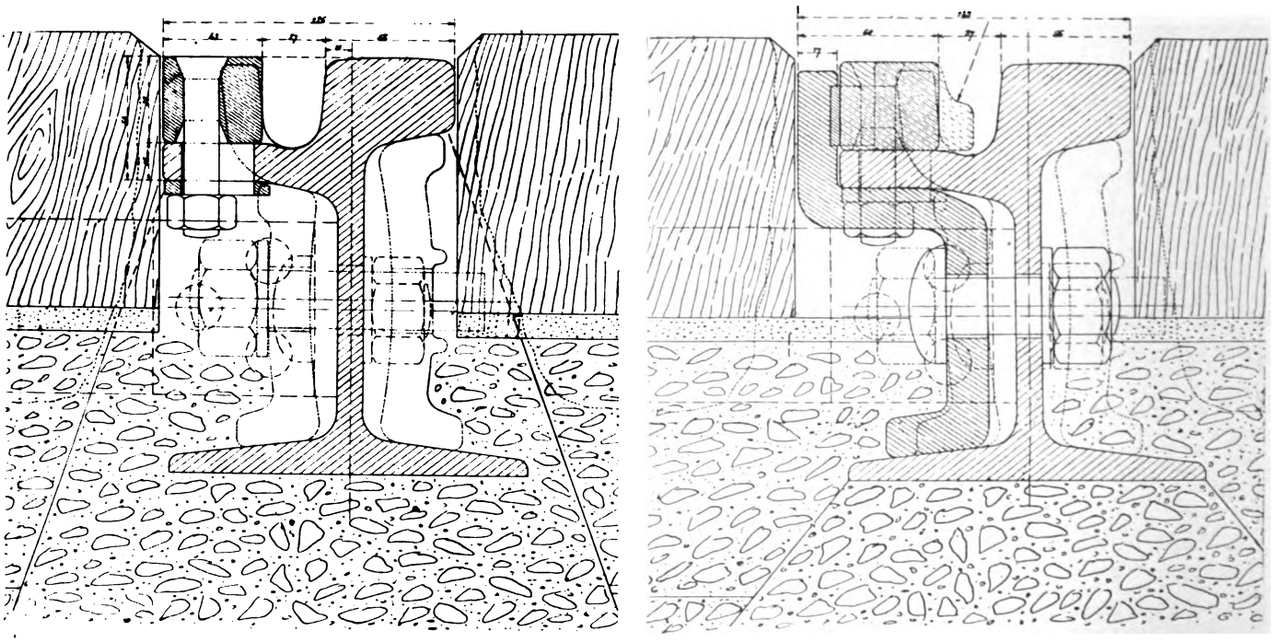

Fig. 9.—Design Proposed by a Member of the Commission.

Digitized by Google

position. It should be pointed out that this horizontal lip is always on the convex side of the inner rail; this facilitates the bending.

The difficulty of firmly seating this horizontal lip or flange on the concrete has led to the introduction of rolled steel supports at certain distances apart; these, besides supporting the horizontal flange, act as bearing studs for the rectangular bar or check rail. The allowance for play being rejected as hardly practical, this check rail, of which the position is unchanged, may be used a second time after turning it end for end. It might even be used four times if it were possible to carry out both a straightening and a new bending. As far as the width of the rails on the road is concerned, it is no greater than that of conduit slot rails, where each of the conduit rails is 60 mm. wide.

In order to compare the different systems enumerated above, it would appear advisable to give the cost of a certain number of them. The comparative costs are approximately as follow:

### Comparative Cost of Different Types of Rails, on Curves, that have been in use.

This comparison is made on a curve of 16 metres average radius, carrying a traffic with about two minutes' headway, and showing after four years' service a lateral wear of 10 mm. on the check rail of the inner rail, and on the tread of the outer rail. With the type U.T.F. 2 adopted by the Union des Tramways de France, the width of the groove would be increased from 32 to 42 mm.; this would seem to be the limit allowable before renewing the rails worn laterally. A renewal of rails on curves every four years is a heavy charge. The question has been raised whether it would not be advantageous to use hard manganese steel rails, of which the lateral wear is generally admitted to be only one-fifth that in steel rails of the quality employed at present. Thereby the life of the rails would be extended to 20 years, and would approach that of rails on straight track bearing a similar traffic. It is on the supposition of this 20 years' life that the comparisons will be made between the different types of rails on curves and on a single line, both as regards the first cost per metre of laying them down and the cost of renewing them.

#### (A) Ordinary Rails.

1. *Manganese steel rails.*

| | |
|---|---|
| Two rails of 53 kgs. per metre = 106 kgs. at 1 fr. 20 per kg. | 127 frs. 20 |
| Value of old metal: 100 kgs. at 7 frs. per 100 kgs. | 7 frs. 00 |
| Cost in 20 years of a metre length of single line | 120 frs. 20 |

2. *Ordinary steel rails, with widened groove and reinforced check rails.*

| | |
|---|---|
| First cost of laying them down: two rails of 53 kgs. per metre = 106 kgs. at 220 frs. a ton | 23 frs. 32 |
| Less value of old metal: 100 kgs. at 7 frs. per 100 kgs. | 7 frs. 00 |
| Cost for four years | 16 frs. 32 |
| Four renewals, each costing as above, plus the removal; the bending of the new rails, the laying, the drilling, at the repaving estimate at 8 frs. 20. | |
| Cost of four renewals (16·32 + 8·20) × 4 = 98·08. Cost in 20 years | 114 frs. 40 |

3. *Silicon steel rails.*

| | |
|---|---|
| 80 to 82 kgs. breaking strain and giving, according to M. Rochat's reports, a life 25 per cent. greater than that of ordinary rails, at a cost of 10 per cent. higher. The result is an economy of 15 per cent., reducing the cost in 20 years to | 100 frs. 00 |

#### (B) Compound Rails.

4. *Marseilles System.*

| | |
|---|---|
| First cost of laying down four rails at 36 kgs. = 144 kgs. | |
| Cover plates per metre run 6 kgs., say 150 kgs. at 200 frs. a ton | 30 frs. 00 |
| Add for bolts, rebending of four rails instead of two, special fish plates, shortening of tie-bars, fixing, and riveting | 8 frs. 00 |
| | 38 frs. 00 |
| Less value of old metal—70 kgs. at 7 frs. per 100 kgs. | 4 frs. 90 |
| Cost for four years | 33 frs. 10 |
| Renewals four, each involving 72 kgs. at 200 frs. 00 a ton | 14 frs. 00 |
| Add for expenses, new riveting, fixing, repaving, 6 frs 00 | 20 frs. 40 |
| Less old metal | 4 frs. 90 |
| Balance | 15 frs. 50 |
| and for four renewals—62 frs. 00. | |
| Cost in 20 years = 33 frs. 10 + 62 frs. 00 = | 95 frs. 10 |

Rails with widened groove after renewal of the check rail by a manganese steel check rail.

5. *Bulfin Type System.*

| | |
|---|---|
| First cost of laying down as for No. 2—cost for four years | 16 frs. 32 |
| Renewal—The manganese steel check rail being the only part subject to wear, its life may be taken at 10 years, or five times that of a steel check rail subject to the whole of the lateral wear. | |
| Taking out the worn check rail | 2 frs. 00 |
| Manganese steel check rail with bolts and fixing | 45 frs. 00 |
| For 10 years | 47 frs. 00 |
| Renewal for six years $\frac{47 \times 6}{10}$ | 28 frs. 20 |
| | 91 frs. 52 |
| Less sale of old manganese, 22 kgs. at 7 frs. 00 the 100 kgs. | 1 fr. 54 |
| Cost in 20 years | 89 frs. 98 |

Rails with widened groove and renewable with a rolled rail—steel check rail with adjustable clip.

6. *Bordeaux System.*

| | |
|---|---|
| First cost of laying down as for No. 2 cost for four years | 16 frs. 32 |
| Renewals: | |
| Taking out the worn check rails | 2 frs. 00 |
| Rolled wing rail of 25 kgs. with adjusting clip | 5 frs. 50 |
| Bolts, bending, fixing, including taking up and relaying paving | 4 frs. 50 |

As the check rail alone is subject to wear, a wear of 7 mm. 5, thickness of the packing piece will occur in 18 months, when the packing can be taken out, and the wing rail will last another 18 months.

| | |
|---|---|
| Unfastening to take out the distance piece and making good, including taking up and relaying paving | 3 frs. 00 |
| Cost of renewals every three years (5·50 + 4·50 + 3) | 13 frs. 00 |
| Five renewals 1 to 3 = 69 frs. less sale of old metal, 100 kgs. (5 × 20) at 7 frs. 00 | 62 frs. 00 |
| Total cost in 20 years = (16·32 + 2 + 62) | 80 frs. 32 |

But there is a refixing of work every 18 months, and the cars are only guided by the check rail of the inner rail, which is a disadvantage.

7.—*The Holt Type System.*

Manganese steel check rail, which by turning can be used twice.

| | |
|---|---|
| First cost of laying them same as No. 2 for four years | 16 frs. 32 |
| Renewals. | |
| Taking out the worn check rail | 2 frs. 00 |
| Holt check rail with chairs and bolts | 40 frs. 00 |
| Turning the check rail after 10 years' use, unfastening, refixing, and paving | 3 frs. 00 |
| For 6 years = $\frac{3 \times 6}{10}$ | 1 fr. 80 |
| Cost in 20 years = 16·32 + 2 + 40 + 1 fr. 80 | 60 frs. 12 |

These calculations, based on the average price of some provincial tramways, may vary according to local conditions, especially according to the nature of the road surface. To summarise, the several systems considered may be classed in proportion to the following figures:

| | | |
|---|---|---|
| 1. | Manganese steel rails | 120 frs. |
| 2. | Ordinary steel rails | 114 „ |
| 3. | Silicon steel rails | 100 „ |
| 4. | Marseilles system | 95 „ |
| 5. | Bulfin type system | 88 „ |
| 6. | Bordeaux system | 80 „ |
| 7. | Holt type system | 60 „ |

The last system should therefore be chosen on all curves which wear out in less than four or even six years; the advantage increasing with the amount of wear on curves in two years and one year. For those on which ordinary check rails would wear out after eight years similar calculations would give the following figures:

| | | |
|---|---|---|
| 1. | Manganese steel rails | 60 frs. |
| 2. | Ordinary steel rails | 52 „ |
| 3. | Silicon steel rails | 45 „ |
| 4. | Marseilles system | 56 „ |
| 5. | Bulfin type system | 46 „ |
| 6. | Bordeaux system | 40 „ |
| 7. | Holt type system | 41 „ |

In this case the advantage would lie with the Bordeaux type, but this system is more easily disturbed than Holt's.

Lastly, for curves of over 25 metres radius and with lighter traffic, of seven or eight minutes' headway on the same track, the ordinary rails with widened grove would be the most economical for the inner rail. The figures given above show the advantage of compound rails for the inner rails on sharp curves.

Digitized by Google

Consequently the Commission is of opinion:

1.—That the system designed by one of its members deserves close study, and should be tested so that it might be compared with those already tried.

2.—Of all the systems in practical use at the present time, to the knowledge of the Commission, and set out above, those which it appears should be recommended more particularly to the members are, in their order of preference:

(*a*) In the case of curves on which working has shown the necessity of renewal in less than four years:

1. The Holt system, or, if the curves are not very sharp, the Bordeaux or Bulfin system.

(*b*) In the case of curves of which the working has shown the necessity of renewal after eight years.

The same conclusions as in the preceding case.

(*c*) In those cases where the renewals on curves have not been found necessary until the lapse of more than 10 years:

The rail U.T.F. 2 is the best for the inner rail; the outer rail may be of the ordinary type, except in the case of curves with a radius of less than 20 metres.

## RAILLESS TROLLEY TRACTION.

DOUBLE-DECK CAR APPROVED FOR BRIGHTON.

A double-deck trolley car, similar in appearance to an omnibus, but having two trolley arms on top, has been sanctioned by the Board of Trade for use on the through railless trolley system to be installed in Brighton and Hove. The car was constructed by the R.E.T. Construction Company, Limited, Finsbury Pavement House, London, E.C. It weighs just under four tons unloaded. Delay has arisen in installing the railless trolley system in the main central thoroughfares of the two towns, owing to the desire of the Hove Corporation to wait until the Board of Trade had sanctioned a double-deck vehicle. Now that the Board's approval has been given, the Brighton Town Council will submit to Hove a scheme for carrying out the installation.

Ramsbottom Town Council have agreed to the Tramways Committee obtaining two additional cars for the railless trolley service. A sub-committee will visit the works of the various makers.

A company is being formed at Tokio to introduce railless trolley car services in six of the principal towns of Japan.

The Shanghai Electric Construction Company, Limited, are making trials of railless trolley cars, and if the experiments give satisfaction it is proposed to start a number of services on routes which are too narrow to permit of tramway construction.

The City Council of Launceston (Tasmania) have adopted a scheme providing for the running of railless trolley and motor omnibus services, and for the borrowing of £30,000 for tramway purposes.

The North Eastern Railway Company propose to apply for powers to run trolley cars in Newcastle and Gateshead in order to run a car service across the high-level bridge. For a number of years private companies have run omnibuses across the bridge, and some time ago the railway company failed in a legal action to compel these 'bus proprietors to pay ½d. per passenger carried, it being held that the toll of 4d. per vehicle was the only legal charge.

## FINANCIAL REPORTS AND MEETINGS.

**City of Buenos Ayres Tramways Company.**—The directors announce a dividend of 1s. 3d. per share (5 per cent. per annum) for the three months ended September 30.

**The Half-Year at Bournemouth.**—In his half-yearly report, Mr. I. Bulfin, general manager of the Corporation tramways, shows that the total receipts for the period ending September were £61,034, and the expenditure £32,689, which is an increase on the gross balance for the six months of £2,489, notwithstanding increases of wages and reduction of hours equal to £1,500 a year, and the increased cost of coal and other materials equal to £1,000 per annum. The increased receipts due to Sunday running amounted to £4,214.

**A Rating Question at Salford.**—In an appeal heard at Salford Quarter Sessions against the assessment of the tramways in Eccles, at the instance of Salford Corporation, the Court decided to treat the tramways in Eccles as an integral part of the whole system in considering what a hypothetical tenant would look at in dealing with the tramways. Therefore they dismissed the appeal with costs. Mr. Sutton, on behalf of the appellants, asked the Court to state a case, but the application was declined, the chairman remarking that the decision was based on a question of fact and not of law.

**Improved Position at Stalybridge.**—In replying to votes of thanks at the last meeting for the municipal year of the Stalybridge, Hyde, Mossley, and Dukinfield Tramways Board, Alderman Ridyard said that neither the tramways nor the electricity department had ever shown as good results as they did to-day. In the electricity department there was a net profit of £509, while at the corresponding period last year there was a loss of £90. Up to the end of the first six months of last year the tramways showed a loss of £6,335; from last March up to the end of September this year the loss was only £1,535.

**Buenos Ayres Lacroze Tramways Company.**—The receipts for the year ended June 30 amounted to $6,162,305 legal currency, an increase of $511,477 on the previous year, and the working expenses were $3,839,729, an increase of $361,478, leaving $2,322,575 as net revenue, while $115,380 was received as interest, etc., and $24,917 was brought forward. After providing for debenture interest and other charges the divisible balance is $1,732,937. A dividend of 5 per cent. is proposed, adding $85 400 to the reserve, $250,000 to the renovation funds, and $23,134 to the fund for extraordinary expenses, and carrying forward $30,460.

**Cape Electric Tramways Company.**—At the annual meeting of the Cape Electric Tramways, Limited, held on November 5 in London, Mr. Ludwig Breitmeyer, who presided, said that the 12 months had shown a steady expansive development in regard to their systems at Cape Town and Port Elizabeth. Last year they had increased the passenger traffic by nearly 1,000,000, and the receipts by about £8,000 beyond the figures of the previous year. This year these figures had again been topped, inasmuch as they carried 1,500,000 more passengers, with an increase in receipts of £12,000. The first quarter of the current year showed an increase in receipts of £2,090 as compared with the same period in 1912. The report was adopted, and a dividend of 5 per cent. on the ordinary shares was declared.

**Progress at Newcastle.**—Alderman Rodgers has presented to the Corporation the appended comparative return of tramways traffic from April 1 to November 1:

| | Receipts. | | | Passengers. | Miles. | Average per Car-mile. |
|---|---|---|---|---|---|---|
| | £ | s. | d. | | | |
| 1913 | 150,900 | 14 | 1½ | 33,405,022 | 3,100,388 | 11·62 |
| 1912 | 135,708 | 3 | 6½ | 29,851,017 | 2,755,602 | 11·82 |
| 1911 | 132,670 | 18 | 2 | 28,842,065 | 2,688,386 | 11·84 |

A report of the Tramways Committee, recommending an increase of 1s. per week in the wages of motormen and conductors, has been adopted.

**Ferranti, Limited.**—In moving the adoption of the report at the eighth annual meeting of this company, Mr. A. W. Tait stated that the result of the trading was £59,509, as against £51,759 the previous year. The net profits showed an increase of £2,867. The balance of profit was £9,096, plus the amount at credit at June 30, 1912—£12,456—making together £22,452. There had been carried to general reserve account £22,000, leaving a balance to be carried forward of £452. In accordance with the usual practice, £10,000 has been carried to depreciation reserve, which now stood at £56,350. With regard to the amount which had been carried to general reserve account, in accordance with the arrangement made in connection with the repayment of the prior lien debentures and the issue of the 5-year notes, the company were not in a position to make any payment to the shareholders until these notes had been redeemed. As they were aware, the notes fell due in 1917. During the year under review the turnover was a record since the date of the reorganisation.

**Provincial Tramways Company, Limited.**—Mr. A. Bettie, J.P., presided on November 21 at the fifty-sixth ordinary meeting of the Provincial Tramways, Limited. The directors' report showed that the net revenue received from the local companies was £41,683, and that the total net revenue was £46,600. After deducting £8,750 for interest to debenture holders for the year, £6,000 for preference dividend, £4,152 for interim dividend on ordinary shares, and other expenses, the balance remaining was £24,668. Out of this the directors set aside £12,000 to the credit of reserve and depreciation account, and £2,000 for third-party insurance or for other purposes, leaving a balance of £10,668. Out of this they recommended a dividend of 1s. per share upon the £1 ordinary shares, making with 8d. per share paid in June last 1s. 8d. per share, equal to a dividend of 8⅓ per cent. per annum for the year. The sum of £4,440 is to be carried forward. Mr. Bettie said the net profit was a record, although the cost of coal remained high, and the cost of oil fuel used in their Diesel engines had been practically doubled. Wages had also been increased to the satisfaction of the employees. Efficiency in all departments had been their first thought and attention, and they believed their system of working was one of the most economical in the running and timing of cars, so as to prevent duplication. They had now obtained a 25 years' lease of their Plymouth and Devonport system at an increased price for wayleave, but they found it to be quite satisfactory. Negotiations were proceeding for extensions of leases in other places. Motor omnibuses had been used during the year, with the result that their profits had been increased and they had warded off competition from their tramways. The meeting increased the directors' fees from £200 to £300 a year, and voted an additional £100 to the chairman.

## INTERNATIONAL TRAMWAY CONGRESS TO BE HELD AT BUDAPEST.

The Executive Committee of the "Union Internationale de Tramways et de Chemins de fer D'Interet Local" have accepted the invitation of the Hungarian Government and the City of Budapest to hold the eighteenth biennial International Tramway Congress at Budapest. The date, as announced in a previous issue, has been fixed for August 31, 1914. The list of questions selected for discussion is as follows:

1. The policy of the distribution of population in towns with regard to means of transport.
   (*a*) The influence of new methods of transport upon the development and extension of great cities. The influence of modern transportation methods upon social customs.
   (*b*) Tariffs of tramways and city and suburban railways:
   1. Bases and methods of investigation. Influence upon traffic. 2. Transfer tickets at reduced prices. Influence upon results of working. 3. Season tickets and various methods of calculating their prices.

Reporters: MM. Duval-Arnould, Membre du Conseil Municipal de la Ville de Paris, and Dr. Kuhles, Membre du Conseil Municipal de la Ville de Munich.

2. Corrugation of rails.

Reporters: MM. Busse, Ingénieur en chef de la Grande Compagnie des Tramways de Berlin, and Resal, Directeur de la Compagnie Française des Tramways électriques et Omnibus de Bordeaux.

3. Rails and tyres.
   (*a*) Investigation into the best shape for rails and tyres, in order to obtain the lowest rolling coefficient and a minimum wear of tyres on curves. Sections of rails with and without grooves; sections of tyres; position of tyres on the rails on straight and on curves; influence of wheel base on curves.
   (*b*) Use of special rails for curves (manganese rails; rails with movable lip adjustable or otherwise).

Reporters: MM. Bacqueyrisse, Ingénieur en chef des Tramways de la Compagnie Générale des Omnibus de Paris, and Minorini, Ingénieur, Directeur des Tramways municipaux de Milan.

4. Roller or ball bearings. Results obtained on motor cars, and on trailers. Resulting saving of current secured.

Reporters: MM. Largiader, Directeur des Tramways municipaux de Zurich; Schoerling, Ingénieur en chef des Tramways de Hanovre; and Tobias, Conseiller technique, Directeur des Ateliers des Tramways électriques de Budapest.

5. Motormen, conductors, and inspectors. (*a*) Methods of instructing them. (*b*) Ticket checking. Methods of delivery of tickets to conductors, accounting for tickets sold, and collection of money.

Reporters: MM. Noirfalise, Directeur Général de la Société Anonyme des Tramways Liégeois, Liége, and Karl Roethy, Inspecteur en chef des Tramways de Budapest.

6. Special appliances for wagons of narrow gauge lines to facilitate the exchange of goods with standard railways. Results obtained from the point of view of time taken and the cost of transhipment.

Reporter: M. Sapin, Administrateur-Directeur de la Compagnie Centrale de Chemins de fer et Tramways électriques, à Paris, Administrateur des Tramways d'Ekaterinoslaw, Bruxelles.

7. Method of working on a length of line common to different concessions. Division of receipts and expenses.

Reporter: M. Fr. Carnevali, Ingénieuren chef de la Société des Tramways de Turin.

8. Light railway locomotives.
   (*a*) Improvements made during recent years.
   (*b*) Is it of advantage (1) To conceal the wheels and the motor mechanism by a metallic cover? (2) To have a platform at each end of the locomotive?

Reporter: M. Hamelink, ancien Directeur de la Compagnie des Tramways Neerlandais, Utrecht.

   (*c*) Employment of superheaters.

Reporter: M. de Soignie, Directeur de la Société Anonyme Mosane pour l'exploitation des Chemins de fer Vicinaux, Andenne (province de Namur).

9. Subterranean feeder cables.
   (*a*) Technical conditions which must be met by armoured cables. (*b*) Use of aluminium as a conductor. (*c*) Probable life of subterranean cables. Statistics.

Reporter: M. Sekutowicz, Directeur des Exploitations de l'Omnium Lyonnais de Chemins de fer et de Tramways, Paris.

10. Three wire distribution for a tramway system. Distribution by higher tension in the suburbs than in the city. Special arrangements of rolling stock, of the generating machinery, and distribution system in order to meet these problems.

Reporter: M. Sieber, Directeur des Tramways de Nuremberg-Furth Nuremberg.

11. Advantages and disadvantages of various systems of transforming high-tension or alternating current to continuous current; motor-generators, transformers, and rotary transformers, etc.

Reporters: MM. Dalrymple, general manager, Glasgow Corporation Tramways, and Sarrat, Ingénieur en chef à la maison E. L. J. Empain, Bruxelles.

12. (*a*) Facilities given to the public for entering carriages; signs at stopping points; distribution of numbers; covered shelters; movable barriers and corridors and refuges; raised platforms; the advantage at times of heavy traffic of supplementary cars, either motor or trail cars.
   (*b*) Means of communicating to the public the destination and route of cars, both inside and outside the cars.
   (*c*) Commercial publicity employed for the purpose of increasing the receipts of tramways and light railways.

Reporter: M. Rodolphe de Weck, Ingénieur des Arts et Manufactures, Directeur de la Société des Tramways de Fribourg et du Chemin de fer Fribourg-Morat-Anet, Président de l'Union de Chemins de fer secondaires suisses, Fribourg (Suisse).

## PERSONAL.

**Mr. G. J. Hollyer** has been appointed station superintendent at Walthamstow Council electricity works.

**Mr. George Balfour,** of Messrs. Balfour, Beatty, and Company, has been appointed a director of the United Electric Tramways of Monte Video.

**Mr. G. W. Stevenson** has left England for Pernambuco, Brazil, to take up a position with Messrs. J. G. White and Company, on the Pernambuco tramways.

**Mr. H. Hughes,** having being appointed chief clerk to Ashton-under-Lyne Corporation Tramways, has resigned his appointment on Walsall tramway staff.

**Mr. C. B. Cripps** has resigned his position with the London County Council tramways department to take an appointment under the Aldershot District Council.

**Mr. L. B. Hogarth,** borough electrical engineer at Morecambe, has been selected for appointment to a similar position at Whitehaven, at a yearly salary of £250. There were 180 applicants.

**Mr. Percy Hodges,** of the Blackpool Corporation electricity works, has received an appointment at Valparaiso. The staff have presented him with a gold watch, a travelling trunk, and a fountain pen.

**Mr. T. E. Boothby,** of the Oldham Corporation electricity department, has been appointed shift engineer at the works of the Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board.

**Mr. Allan B. Field,** chief designer of turbo-electric machinery to the Westinghouse Electric Company, Pittsburg, has been appointed professor of mechanical engineering at the Manchester School of Technology.

**Mr. P. J. Boucher,** for three years traction lamp expert to Siemens Brothers Dynamo Works, Limited, has been appointed to a similar position with the Edison and Swan United Electric Light Company, London.

**Mr. S. C. Marengo,** sub-manager of the Buenos Ayres and Pacfic Railway Company, has, resigned that position, having been appointed general manager of the Central of Buenos Ayres Railway Company and the Lacroze Tramways Company.

**Mr. W. H. Taylor** has resigned the position of assistant electrical engineer at Walthamstow Council electricity works, to accept an appointment as chief station superintendent at the new Government power-station at Perth, Western Australia.

**Councillor J. H. Hargreaves** has been elected Mayor of Hull. Owing to indifferent health, Alderman Robson resigned the chairmanship of the Tramways Committee, and Councillor Hargreaves, the deputy-chairman, was appointed in his place.

**Mr. F. O. C. Nash,** who has been in charge of the tramway extensions on the west of Newcastle-on-Tyne, has received an appointment under the Town Planning Act with the Birmingham Corporation. Mr. Nash is an officer in the Territorial Force.

**Inspector J. Campbell,** Manchester Corporation Tramways, has been presented with a silver coffee service by the employees of the Oldham Road branch on the occasion of his retirement. He has also received a clock from passengers on the Rochdale Road section.

Digitized by Google

**Mr. R. S. Tresilian,** secretary of the Dublin United Tramways, has returned to Dublin after a month's tour, in the course of which he visited Brussels, Paris Berlin, Vienna, Budapest, Athens, Smyrna, and Constantinople. He devoted much attention to tramway systems.

**Mr. J. Brierley,** who has been appointed traffic manager to Oldham Corporation Tramways, started as a car cleaner on the steam tramways, 17½ years ago. After the electrification he became a motorman, and subsequently he went into the repair shop. He has since served as an inspector and chief inspector.

**Alderman A. Martin,** chairman of Southend Light Railways Committee, presided at the first of the annual dinners of the employees, and, responding to the toast of his health, said more depended upon the staff who had the handling of the tramway undertaking than upon the members of the committee who controlled it.

**Alderman R. A. Smithson** has been appointed chairman of Leeds Tramways and Electricity Committee. He thus resumes a position he formerly held for more than 10 years. During his chairmanship the electrification of the Leeds tramways was completed, and the department became one of the most prosperous in the country.

**Mr. J. J. McGregor,** assistant engineer at the Deptford generating station of the London Electric Supply Corporation, has been appointed charge shift engineer at the London County Council's Greenwich generating station in succession to Mr. W. W. Warren, resigned. The salary is £250 a year, rising by annual increments of £10 to £300. There were 140 applications.

**Mr. Charles Vernier,** the new chairman of the Newcastle-on-Tyne local section of the Institution of Electrical Engineers, is 36 years of age. Before taking up his present position with the Newcastle-on-Tyne Electric Supply Company he was from June, 1899, to the end of 1900 an assistant engineer of the Cork Electrical Tramways and Lighting Company. He received this appointment from Mr. Charles H. Merz, who was then chief engineer to the company.

**Mr. Charles Furness,** general manager, Blackpool Corporation Tramways, and borough electrical engineer, has received from the Tramways Committee an increase of £200 in his salary of £700 per annum. Improvements introduced by Mr. Furness, including the open touring cars on the circular route, helped to increase the receipts to £74,166, as compared with £42,572 in 1904. For the 8½ months of the present year the receipts have reached £73,018, and it is estimated that by the end of the year the total will be £85,000. The profit in 1904 was £1,032 and last year £18,331, while for the present year the estimate is £25,000.

**Mr. J. Dalrymple,** general manager, Glasgow Corporation Tramways, was referred to by the chairman of the Tramways Committee in the remarks which he made at the luncheon on the occasion of the annual inspection of the various departments. Ex-Bailie Kirkland observed that during the year they had increased the wages of the employees in every section with the exception of the general manager. The maximum wage of motormen and conductors had been raised from 33s. to 34s. per week, and next year it would be further increased to 35s. per week. The cars, the chairman added, were carrying 337 millions of passengers per annum.

**Mr. Walter T. Young,** who for two years has been traffic superintendent, Oldham Corporation Tramways, has been appointed to a similar position under the West Ham Corporation. Before going to Oldham he served under the Aberdeen Corporation for 14 years, and for four years was traffic superintendent. On December 5 Mr. Young was presented by the Oldham staff and employees with a gold watch chain, and a gold pendant for Mrs. Young. In making the presentation, Mr. Dugdale, the manager, stated that Mr. Young had risen from the bottom of the ladder. In reply, Mr. Young said he had tried to follow the motto of the Tramwaymen's Brotherhood.

**Motorman Gamble,** of the Birmingham tramways, was presented with a guinea at a meeting of the Tramways Committee by the Lord Mayor, who complimented him upon a plucky act. A little girl ran in front of his car, whereupon Gamble applied the brakes, but realising that it was not possible to stop the car in time he jumped off, and dragged the child away just in time to prevent an accident. Gamble himself ran considerable risk, and he received a slight injury. The matter was reported to the trustees of the Carnegie Hero Fund, but they are reluctant to intervene in the case of a municipal employee, believing that the municipality should make the acknowledgment of such acts of courageous conduct.

**Mr. C. W. Shepherd,** general manager, Edinburgh Tramways Company, at one of the three annual concerts on November 21 in aid of the Tramways Employees' Widows' and Orphans' Fund, was congratulated by Mr. B. Hall Blyth, the chairman of the company, on being present after the serious illness which he had gone through. Sir Robert Maule, one of the directors, who presided, at one of the other concerts, made a similar observation. These concerts, which were originated by Mr. Shepherd, have contributed £2,450 to the funds, of which sum £1,300 is invested. The employees each first contributed 4s. 4d. and now 6s. 6d. annually, and in 10 years their contributions have totalled £1,490.

**Mr. R. H. Harvey,** engineer and manager to the Ascuncion Tramways of the Paraguay Central Railway Company, was referred to at a recent meeting of the shareholders in London. The chairman (Mr. V. V. Branford) stated that the directors were fortunate in obtaining the services of a very able and experienced engineer and tramway manager, under whose organisation the electrification of the Ascuncion tramway had proceeded satisfactorily, and would be completed within a few weeks probably, and the installation of the light and power plant before the end of the year. A separate company, the Ascuncion Tramway, Light, and Power Company, had been organised and would work in collaboration with the railway company.

**Mr. F. Eggington,** who for some years has been the chief assistant in the West Ham tramways department, has resigned that position in order to take a position under his old chief, Mr. H. E. Blain, of the London Underground Railways. The tramways committee have accepted Mr. Eggington's resignation, and have recommended that Mr. Hopkins be appointed to the position at a salary of £250 per annum, rising by annual increments of £25 to £300 The committee have appointed Mr. A. C. Debenham to be accounts clerk at £200 per annum, rising to £220 by annual increments of £10; and Mr. J. O'Niel to be traffic clerk at £120 per annum, rising by annual increments of £10 to £150. The filling of the post of traffic superintendent, at a commencing salary of £225 per annum, has been left to the tramways manager and the chairman of the Tramways Committee.

**Councillor Rodgers,** chairman of Newcastle Tramways Committee, was elected on November 10, without opposition, to a vacant seat on the aldermanic bench, after 19½ years' service as a councillor. In addressing a meeting of ratepayers Councillor Rodgers said the tramways carried the population four times over per week, which was done by no other city with the exception of Glasgow. They had taken £2,014 on the Westerhope 'buses, and had carried 227,665 passengers. The omnibuses had also proved an admirable feeder to the cars, and the routes concerned had shown increased receipts by £20 a week. Although to concede halfpenny fares at present would do away with the profit on the tramways, such fares would ultimately come, although not before a lot of the present debt on the system had been cleared off.

**Mr. F. H. Corson,** who has been appointed manager of Gloucester tramways while retaining his position as borough electrical engineer, was highly spoken of by the Electricity Supply and Light Railways Committees in the joint report in which they recommended the appointment. The report pointed out that Mr. Johnson, the late manager, was in receipt of £350 a year, and Mr. F. H. Corson, who had been engineer and general manager of the electricity works since 1909, received £400, and was allowed to take one pupil. Mr. Corson had rendered most efficient service in connection with the electricity undertaking, and was well qualified to undertake the general management of both undertakings. He was willing to undertake the dual duties subject to the appointment of a traffic manager under his supervision and control. The committees also advised that the track repair and maintenance should be entrusted to the Streets Committee, subject to the adjustment of expenses, and that the electricity and light railways undertakings should be placed under the management of a single committee.

**Mr. George Herman Anger,** managing director of the Anger Manufacturing and Supply Company, Limited, of Preston, recently returned from America. During his stay there Mr. Anger made an extended tour through the United States and Canada in the interests of the Anger brake adjuster, and attended the Convention of the American Electric Railway Manufacturers' Association. The Anger device was exhibited at the exhibition held in connection with the Convention. The adjuster was displayed in actual working conditions on a full sized model truck, and attracted much interest. The Ackley Company are the sole manufacturers and selling agents for the brake adjuster in the United States, and they have received orders from various large systems, among them being the systems of New York City and Brooklyn. Among recent orders received are those from Shanghai, Hong Kong, Pretoria, Durban, Port Elizabeth, Buenos Ayres, Para, and other places abroad. The Santos Tramways Company recently ordered 72 sets, and the same number is being supplied to the Anglo-Argentine Tramways.

---

**The Late Mr. T. Frame Thomson,** a director of several South American tramway companies, has left estate valued at £47,183 net.

**Mr. Alfred S. Giles,** general manager and engineer-in-chief of the Lisbon Electric Tramways Company, has died from enteric fever. He began his career on the engineering staff of the Edison Company, Limited, and afterwards served with Thompson, Ritchie, and Company. In 1904, while holding the position of engineer to Blackburn Corporation electricity department, he was appointed engineer-in-chief to the Cape Tramways Company, and early in 1911 he was transferred to Lisbon. During his tenure of the latter offices he dealt successfully with labour and revolutionary troubles, and came to be held in high esteem by the staff as well as by the directors of the company.

## CONTRACTS AND ORDERS.

**Chamberlain and Hookham, Limited,** have received a contract for meters from Ipswich for 10 amperes and upwards.

**W. A. Stevens, Limited,** Victoria Street, Westminster, have supplied a petrol-electric omnibus to Leeds Corporation Tramways.

**The Lorain Steel Company** have secured the contract for special track work, amounting to about £42,000, for the St. Petersburg tramways.

**E. Bennis and Company, Limited,** have received a repeat order from Barnsley Council for four mechanical stokers and self-cleaning compressed air furnaces.

**Sunderland Council** have allotted contracts as appended: Union Cable Company and I.R. and G.P. Company, cable; E. Green and Sons, new sections and parts for economiser.

**Derby Council** have sanctioned a proposal by the Tramways Committee to place two automatic point controllers at the junction of Douglas Street and Osmaston Road, at a cost of £80.

**Huddersfield Council** have been recommended by the Electricity Committee to accept the tender of Messrs. Switchgear and Cowans, Limited, for a high-tension switchboard, at £2,259.

**Walsall Council** have accepted the tender of the British Westinghouse Company for the supply of a motor and starter, £27 9s., and of the Callender Cable and Construction Company for laying a length of cable, at £123 17s.

**Aberdeen Council** have accepted the tender of the Brush Electrical Engineering Company to supply their interpole type of motors for six new cars, and of the British Westinghouse Company for controllers and electrical equipment.

**The Titan Trackwork Company, Limited,** of Rutland Works, Sheffield, have received contracts for points and crossings from the following: Barnsley and District Tramways Company, Preston, Manchester, and Bootle Corporation Tramways.

**Mirrless, Bickerton, and Day, Limited,** have been awarded a contract for the supply of a Diesel engine and generator at Worthing Corporation electricity works, at £3,785 for the engine and £683 for the generator. The latter will he supplied by Crompton and Company.

**J. G. White and Company** are carrying out the construction of the electric tramway and lighting systems in Pernambuco, Brazil, for Dodsworth and Company, of Rio de Janeiro. English cars will be used, but the power plant and the rails are of American manufacture.

**Luton Council** have accepted the following tenders: Tudor Accumulator Company, Limited, traction battery of 250 cells, £1,137, less approximately £170 for existing battery; Hudson Economiser Company (1907), Limited, cooling tower of 170,000 gallons capacity, £889.

**Wigan Council** have accepted contracts for installing a new turbine and accessories at the electricity works. Councillor Bickerstaffe mentioned that the Electricity Committee had obtained the very best articles they could get, and they could not be bought cheaper without going to Continental makers.

**Peckham Pendulum Trucks.**—Contracts have been awarded recently to the Brush Electrical Engineering Company, Limited, for Peckham pendulum trucks by the following Corporations, *i.e.*: Bexley Heath, 15; South Shields, 5: and Newcastle-on-Tyne, 12. This is the second order from Newcastle.

**Salford Council** have allotted contracts to the British Westinghouse Company for the supply of two additional potential transformers on the extra high-tension switchboard, at £42 10s., and to J. Wolstenholme and Son for an additional vertical two-stage air compressor at the electricity works.

**Canadian General Electric Company, Limited,** have secured the contract for equipping the sub-station at Rougemont, of the Montreal and Southern Counties Railway; a 300-KW. motor generator set, a bank of transformers, high and low-tension switchboards, lightning arresters, and switching apparatus.

**Glasgow Electricity Committee** have recommended the Corporation to accept the tender of the American Engineering Company to equip one pair of boilers with their stokers at £1,400, on the understanding that if the stokers do not prove satisfactory the company will remove them free of cost to the Corporation.

**The National Rail and Tramway Appliances Company, Limited,** have contracts in hand at the present time for 70 tons of brake blocks for various Government railways. They are also supplying, among other contracts, brake blocks to the Metropolitan Railway, and 7,000 blocks to the London, Brighton, and South Coast Railway.

**The Tudor Accumulator Company, Limited,** recently added six plates to each cell of the battery at Pontypridd generating station. Mr. J. E. Teasdel, the engineer, in reporting on the work, stated that the battery was on load again on the fourth day, and that in view of the heavy demands it was a good thing that they were able to get the work done so expeditiously.

**London and South Western Railway Electrical Scheme.**—Messrs. Scholey and Company, Limited, have received an order for their special tool steel gears and pinions from the British Westinghouse Company for the whole of the equipments required in the electrification of the suburban lines of the London and Sonth Western Railway. This constitutes the largest single order ever placed in this country for gears and pinions.

**Leicester Council** have placed the following contracts: United Electric Car Company, 12 top covers for cars; Walter Scott, Limited, 180 tons of steel rails and six tons of fish plates, £1,273 10s.: T. Wragg and Sons, Limited, 2,800 yards of single-way stoneware conduits, 4 in. diameter, £136 10s.; Bayliss, Jones, and Bayliss, Limited, 1.000 steel tie bars in three lengths, £79 3s. 4d.; and Ibbotson Brothers and Company, Limited, six tons of bolts, nuts, and washers, £141.

**Manchester Corporation** have approved of the following tenders: E. Green and Sons, Limited, renewal and replacement work to economisers at Bloom Street Station; British Thomson-Houston Company, Limited, the Brush Electrical Engineering Company, Limited, and Siemens Brothers Dynamo Works, Limited, requirements of lamps during the period ending June 30 next; Ferranti, Limited, high-tension switch gear; Johnson and Phillips, Limited, cable.

**Warrington Council** have allotted contracts as follow: Low-tension cable, the Union Cable Company, Limited; switchboard feeder panel, Drake and Gorham, Limited; extensions of buildings and plant at the electricity works: Buildings, J. Dolan and Son, £2,738; boiler plant, Babcock and Wilcox, Limited, £2,362; turbo-alternator plant, J. Howden and Company, Limited. £5,843; condenser plant, Worthington Pump Company, Limited, £3,344; economiser plant, Goodbrand and Company, Limited, £203 10s.

**Leicester Council** have adopted the following contracts: J. Chapman and Sons, Limited, of Leicester, builders' work for car repairing shops to be erected in Abbey Park Road, at £1,406; Siemens Brothers Dynamo Works, Limited, building and installing a turbo-generator at Lero electric generating station, with reversible rotary converters, switch gear, etc., and the installation of a rotary converter at Aylestone electric generating station, together with the necessary switch gear, at £20,018; Clarke, Chapman, and Company, steam-raising plant necessary in connection with the additional generating plant at Lero station, at £8,212.

**Glasgow Council** have accepted tenders as subjoined for the tramways department: Cast-steel pipe connections, Babcock and Wilcox, Limited; cast-iron pipe connections, Macfarlane, Strang, and Company, Limited; slide valves, Dewrance and Company; trolley feed cable, St. Helen's Cable Company; insulated bolts, W. C. Yuille and Company, Limited, and J. Hally Craig; traction lamps, General Electric Company, Limited; double cotton-covered copper wire, British Insulated and Helsby Cables, Limited; overhead crane, Alex. Jack and Company; tower wagon chassis, Halley's Industrial Motors, Limited; steel work, etc., Dalhousie depot, Redpath, Brown and Company, Limited; trolley wire, F. Espir.

**Heat-Resisting Grey Enamel.**—The London County Council have placed an order for 500 gallons of heat-resisting grey enamel, at 8s. 6d. a gallon, for plough bases, with Messrs. Pinchin, Johnson, and Company, Bevis Marks, London, E.C. The order was placed on the recommendation of the Highways Committee, who reported that experiments had been carried out with preservatives for treating plough bases in substitution for the compound at present in use, which was affected by heat and was inflammable. So far the most satisfactory results had been obtained from a special heat-resisting grey enamel supplied by Pinchin, Johnson, and Company. This enamel was a good insulator, and this property made it still more suitable for the purpose required. Having regard to the good results of the experiments, the Highways Committee were of opinion that it was desirable to treat all the plough bases in use with the enamel at the earliest possible moment, particularly in view of the approach of winter.

**London County Council** have accepted the following tenders: A. and F. Manuelle and John Fyfe, Limited, 275 tons each of Aberdeen granite paving setts, at 36s. 6d. a ton; A. and F. Manuelle, 150 tons of Guernsey granite paving setts, at 35s. a ton; G. Hayward and Company, Limited, 80 movable platforms for car-washers at Cressy Road car shed and 36 such platforms for use at Camberwell car shed extension, £7 each; Enfield Autocar Company, Birmingham, six motor cars for the tramway department, £1,986; Dennis Brothers, motor lorry for use by the fire brigade, £615; Hardy and Padmore, three dozen each cast-iron feeder pillar cases and cases, £240 8s. 9d; J. Billingham, Cradley Heath, 12 tons of standard flanged tread plate, £198 18s.; Kowley Brothers, Wood Green, erection and completion of Abbey Wood car shed, £16,981; British Insulated and Helsby Cables, one ton of T.C.C. copper wire ·229 in. diameter, and 1½ tons of D.C.C. copper wire ·229 in., for winding field coils, £224 1s. 9d., less 2½ per cent. discount.

# TRAMWAY AND LIGHT RAILWAY NOTES.

## ABERDEEN.

TRAIL CAR SANCTIONED.

Replying to the observations of Aberdeen Tramways Committee in regard to the application by the Aberdeen Suburban Tramways Company for permission to run trailer cars on their lines, the Board of Trade have stated that they see no sufficient reason to object to the use of trail cars as proposed, provided suitable arrangements for turning were made at the termini.

## BELFAST.

RESPONSIBILITY FOR TRACK MAINTENANCE.

As the result of a discussion on the question whether the general manager's department or the city surveyor is responsible for the maintenance of the tramway track, the Tramways Committee have requested Mr. Nance to obtain information as to the procedure adopted by other municipalities.

## BIRMINGHAM.

STANDING ROOM IN CARS.

The decision of the Tramways Committee to allow six persons to stand in a car resulted in considerable criticism, and the committee have since resolved to permit six persons to stand up to 9-30 every morning, on Saturday afternoons from mid-day, and on bank holidays all day

## BRADFORD.

VESTIBULE CAR BUILDING—SPENCER-DAWSON BRAKE.

What are termed "Dreadnought" cars are now being constructed at the tramways depot at Thornbury, where 225 men are employed in making and repairing the whole of the bodies of the cars used in the Bradford service. Vestibules are fitted to the new cars, which have motors of 50 H.P. These six cars are 19 ft. in length instead of 16 ft., and they are being fitted with the new power brake invented by Mr. C. J. Spencer and the assistant engineer, Mr. J. W. Dawson. It is operated by pneumatic pressure, which compresses two springs to keep the brake in the off position. It is brought into action by reducing the pressure. The Thornbury works are about to be enlarged.

## BRISTOL.

POLL OF RATEPAYERS ON PROPOSED TRAMWAY PURCHASE.

By the statutory majority the Corporation on November 10 carried a resolution authorising the promotion of a bill to permit of the purchase of the Bristol Tramways Company's undertaking, and to take a poll of the ratepayers upon the question of the acquisition of the lines under the Tramways Act, 1870.

## BURNLEY.

GOODS SERVICE ON TRAMWAYS.

The period for which the Board of Trade sanctioned the use of a goods wagon in conjunction with a motor car having expired, application has been made to the Board for consent to continue the use of the wagon. This was described in THE TRAMWAY AND RAILWAY WORLD of December 12, 1912.

## GLASGOW.

FOOTBALL TRAFFIC DIFFICULTIES—CENTRE STANDARDS—SIX STAGES FOR A PENNY—JACKS AND TRUCKS.

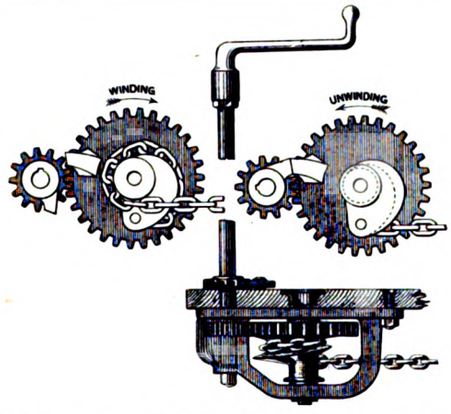
Football spectators who enter tramcars by climbing over the dashboard or the staircase railings are being reported with a view to prosecution under one of the by-laws.—Whilst motorists are urging the removal of the centre standards in the tramway system, others are declaring that there is no evidence of any desire on the part of the ratepayers in Hillhead and Kelvinside for the removal of these instruments of safety for the pedestrian. The poles, it is contended, serve a most useful purpose in splitting the traffic, and if the scorching motorist is compelled to slow down to a reasonable speed the public are all the better pleased.—It was suggested by the convener of the Tramways Committee, at the luncheon following the annual inspection of the tramways and works, that an extension of the number of stages given for a penny from four to six would be a great boon. In January, 1911, the two-stage fare was inaugurated That was the stepping-stone to the doubling of the halfpenny distance. The further reduction which took place in December of that year brought a temporary decline in the revenue, but in a short time the department were drawing a greater revenue than ever. At the end of the year the committee expected that the revenue would show an increase of £50,000 over the £1,007,652 received in the previous year. There were 850 cars in stock, and the manager had been authorised to proceed with the construction of an additional 150 cars. The cars are being equipped with lifting jacks, manufactured at the car works at Coplawhill. It is locally reported that experiments have been carried out there in the construction of trucks, and that several improvements have been effected.

## HULL.

TRAMWAY SIGNALLING APPARATUS.

Pending the presentation of a report by the city engineer on a proposal to install electrical signals at bridges, the Hull Tramways Committee have adopted a suggestion made by the tramways manager

5,258 BRAKES SOLD IN 90 DAYS!



The "Peacock" IMPROVED Brake.

(PATENT).

Note the simplicity of the Radial Contact pieces which render this the quickest of all geared hand brakes by

(1) Preventing the drum from over-running on release;

(2) Stopping the drum always at the point from which recovery of chain is most rapid;

(3) Eliminating all idle turning of the handle.

Metropolitan Building,
New York City, August 26, 1913.

J. McI. Cater, Manager,
Peacock Brake Co.,
London, England.

Dear Mr. Cater:

It affords me pleasure and is only fair to inform you that the Peacock Improved Brake, shipped by you from England last Fall, was tested under the supervision of the Public Service Commission of this State, and was awarded the highest percentage for efficiency over all other hand-geared brakes - and, rest assured; they were all there. The outcome of this test resulted in the National Brake Co., of Buffalo, N. Y., immediately purchasing the rights from me to manufacture and sell the Peacock Improved Brake in the United States.

We have thus far only shown it to the companies mentioned below who have purchased the following number of brakes within the last ninety days.

| | |
|---|---|
| The Brooklyn Rapid Transit Co. | 4036 |
| Second Avenue Railway Co. | 550 |
| New York Street Railways Co. | 440 |
| Third Avenue Railway Co. | 102 |
| Belt Line Railway Co. | 80 |
| Manhattan & Queens | 50 |
| Total Number Brakes Sold | 5258. |

To my mind your success in Europe, and the initial sales in the United States, speak well for the future of the Peacock Improved Brake.

Yours sincerely,

The "PEACOCK" BRAKE CO., 27, Clements Lane, LONDON, E.C.

Digitized by Google

that orderly boys should operate signals so that arrangements could be made to divert tramcars to other routes when a bridge is about to be opened to allow shipping to pass. The engineer has been in negotiation with a number of firms with regard to the supplying of an apparatus, but he has experienced great difficulty in obtaining designs of anything that would be suitable.

### LIVERPOOL.

THE GOODS-CARRYING PROPOSALS.

Several members of the City Council who are conversant with the needs of the port, as regards relief from traffic congestion, have commented favourably upon the scheme presented by the tramways manager for the construction of tramways for the conveyance of goods to South Lancashire. Mr. Philip D. Holt can see no reason why the merchant shippers should not guarantee a traffic of at least 1,314,000 tons, as asked for by Mr. Mallins, for that figure represented only about 4 per cent. of the traffic of the port. The carriage by tramway of even 4 per cent. of traffic would do something to ease the pressure at the docks, without doing injury to the railway companies or firms of carriers, which he and others were anxious to avoid. If it competed with anything, the tramway service would be a rival to motor lorries.

### LONDON.

CENTRAL CAR REPAIRING WORKS—THROUGH RUNNING—PETROL ELECTRIC CARS—QUEUES.

The central car repair works of the London County Council Tramways are making progress towards completion. The buildings are situated at Charlton, on the way to Woolwich, and the works are connected by a siding with the South Eastern Railway. Eleven tenders were recently received from selected firms for the erection of the third section, the tenders varying from £25,690 to £30,750, the architect's estimate being £27,600. The Council have accepted the lowest tender, that of Charles Wall, Limited.—Bexley Council have authorised their tramways manager to confer with the chief officer of the London County Council Tramways with reference to through running of cars between London, Bexley, and Erith.—As the result of experimental running of petrol-electric tramcars from Tooley Street to Greenwich Church, the Highways Committee of the London County Council have reported that the Burdett Road and Grove Road horse tramways route would not be suitable for working by means of such cars.—With the assent of the City of London Corporation, the County Council are promoting a bill to authorise extension of tramways in several thoroughfares under the Corporation's control, notably in Farringdon Street to a point near Ludgate Circus.—A by-law with regard to the formation of queues by intending passengers on the Council's tramcars has been approved of by the Home Secretary. On November 18 the Council adopted a by-law to deal with obstruction caused by the breakdown of vehicles.

### MANCHESTER.

VISIT OF OFFICIALS TO THE CONTINENT—"SAFETY FIRST"—TICKET INSPECTORS.

The chairman of the Watch Committee and the chief constable are preparing a report on their recent visit to several Continental cities in order to investigate the traffic methods adopted there in order to minimise accidents. It is stated that the notice placed in tramcars asking people to be on the look out for passing vehicles as they alight from the cars, has had the effect of reducing the number of such mishaps. Interviewed with reference to a complaint that ticket inspectors are too numerous, Mr. J. M. McElroy has said: "We have no more ticket inspectors than are necessary. In fact, we have not enough. We are collecting nearly one million pounds, or near that, every year, and that we are carrying four million passengers per week. We have less than 40 ticket inspectors, and their hours are so arranged that they are on duty the whole time the cars are running, which is now day and night."

### NEWCASTLE.

A QUESTION OF BRAKES.

The remaining mile of the tramway extension to Lemington has been opened by running cars to and from Lemington to Sandy Banks, Newburn. The Heaton-Lemington line was opened last August, but the Board of Trade refused to sanction the running of cars beyond Lemington until the vehicles were fitted with powerful brakes, in view of the short steep gradient at Northumberland Road.

### PLYMOUTH.

LONG-WHEEL-BASE TRUCKS.

Alderman Phillips has reported to the Town Council that the experiment of trying a car with a longer truck promised to be successful. There was less power used and less strain on the curves. If it succeeded they might apply to the Board of Trade for permission to use top-covered cars.

### PRESTON.

ADDITIONAL ROLLING STOCK REQUIRED.

The Council have been informed that it was essential that at least six more cars should be purchased in the immediate future, that the car sheds would need to be enlarged, and the generating plant increased. The reduction of the three-halfpenny fare to a penny on the Penwortham route has been a financial success.

### ROTHERHAM.

TRACK DOUBLING.

In Rotherham, as in a number of other towns, the Corporation have decided to obviate the inconvenience of single track lines by ordering duplication of the tracks in Effingham and Fitzwilliam Roads.

### SHEFFIELD.

TOP-DECK PASSENGER RECKONER.

The tramways department has been experimenting during the past two months with a device, the invention of a local man, for indicating the number of passengers on the upper deck of the cars, and thus showing conductors and intending passengers whether there is any room without giving the trouble of climbing the stairs. The device is connected with two of the steps of the staircase, and pressure upon these steps makes an addition to the number on the dial. When a passenger descends a subtraction is automatically made.

### TYNESIDE.

SIGNALLING INDICATORS.

A recommendation in favour of indicators being placed on all single lines between loops was made by the jury at the inquest on a conductor who was killed as the result of a collision in a fog between a trolley wagon and a tramcar on a system of the Tyneside Tramways Company. Mr. F. H. Briggs, resident engineer to the company, stated that where there were obstructions to the view of the drivers there were indicators at curves between the loops, but on the Gosforth track these indicators were not necessary.

### WALTHAMSTOW.

OMNIBUS OBSTRUCTION—A TRAMWAY SIDING.

In consequence of the obstruction of tramway traffic caused by omnibuses stopping to pick up and set down passengers on the tramway track in Hoe Street, the Town Council have requested the Commissioner of Police to put a stop to the practice. The Metropolitan Stage Carriage Act provides that such vehicles shall draw alongside of the pavement when taking up and putting down passengers. In order to add to the convenience of passengers, application has been made to the Great Eastern Railway by the tramways manager, Mr. W. Murray, for the construction of a tramway siding at Hoe Street Station.

## PATENT LIST.

**Specially abstracted for "The Tramway and Railway World" from the Official Journal of Patents.**

***** If the inventions have been communicated the names of the communicators are given below in italics.**

### APPLICATIONS.

Applications for Letters Patent have been filed:

24,963 Electric bell signalling for railway purposes—F. Raybould.
24,988 Audible signalling apparatus—W. Dudley and E. H. Dudley.
25,006 Three-position block instrument for railway and tramway purposes—McKenzie and Holland, Limited, and C. H. W. Edmonds.
25,018 Electric railway signalling and means therefor—Siemens Brothers and Company, Limited, and J. Boot.
25,092 Anti-side splash mud-preventer for motor omnibuses—F. G. Reason.
25,129 Electric apparatus for automatic track signalling on railways—E. W. Bottle.
25,164 Control of electric motors on traction systems, etc.—R. F. Baerlocher.
25,179 Process and apparatus for welding rails—Th. Goldschmidt Akt.-Ges.
25,234 Wind and weather screens for tramcars—G. Morris.
25,246 Permanent way—C. Pasel.
25,263 Brakes for tramway vehicles—F. van der Straeten.
25,350 Train control systems—A. Kerr.
25,363 Electrical conduit systems—M. Railing and T. Taylor.
25,385 Electric storage batteries—G. Inrig and G. J. Mills.
25,391 Continuous brakes and brake controllers—W. R. Smith.
25,462 Collapsible top for omnibuses—J. Graham and H. H. Fyfe.
25,473 Electrical lighting of trains—G. Inrig, Limited, and G. Inrig.
25,479 Cooling arrangements for electric locomotives—Siemens-Schuckertwerke G.m.b.H.
25,544 Fittings for electrical conduit systems—D. L. J. Broadbent.
25,627 Metal-welded joints—A. O'Malley.
25,636 Automatically controlling railway trains—W. S. Beck.
25,671 Vacuum brake apparatus—F. J. Gresham and G. Kiernan.
25,676 and 25,677 Railway car seats—F. Bennett.
25,679 Railway chairs and chair keys—O. Imray *(J. W. Stephenson)*.

Digitized by Google

25,697 Rail joints—W. T. Sapp.
25,776 Fish joint for railways—C. M. Knudsen.
25,790 Insulating covering for overhead wires—G. H. Vaughan.
25,832 Machines for treating compound rails—J. Noll.
25,875 Self-holding hinge for suspending indicators in tramcars, etc.—J. Robson.
25,901 Electric signalling system for railways—C. C. Wilson.
25,917 Engines for traction on centre-rail railways—G. N. Fell and J. H. Tindall.
26,198 Pulleys for the trolleys of electric cars—A. Welsh.

**PATENT WEATHER SCREEN FOR MOTOR 'BUSES.**
**NO GLASS.** Instantaneously opened and closed.
**ADJUSTABLE TO ANY DRIVER. NO REFLECTED LIGHTS.**
*As supplied to the Birmingham Corporation, Sheffield Corporation, and London & North Western Railway Co., etc., etc., etc.*

### TRAMWAY DIRECTORIES.

A useful feature of this issue is the directory of electric railways and electric tramways which will be found among the advertising pages. This directory contains the names of the chief officials and the principal particulars relating to each undertaking.

The directory is revised as occasion requires, and is the most up-to-date and comprehensive list published.

Evidence of the advance of the motor omnibus is afforded by the number of applications to be made in the next Parliamentary session by municipal and company tramways for powers to run that class of vehicle. A record total of 18 will engage the attention of Parliamentary Committees, the applications coming from some of the largest as well as from several of the minor local authorities. The former include Glasgow and Birmingham. In the midland city negotiations are on foot for acquiring the undertaking of the Omnibus Company, whose services supply a public want in those portions of the city unprovided with tramways. This enterprise is so much appreciated that a number of new routes have recently been sanctioned by the Watch Committee, while the last omnibus for the day from one of the distant suburbs is permitted to accept passengers for the centre of the city. While the company is not further allowed to run in competition with the tramway undertaking, Birmingham perhaps affords the best example, outside of London, of the travelling public having the opportunity to judge of the merits of the two forms of traction side by side. It is quite possible that the tramway management has profited by the experience, and that as soon as the department acquire a sufficient number of omnibuses a scheme will be put into operation for the use of routes other than tramway streets, and possibly of some of the latter, in order to provide express services, unimpeded by the congestion which prevails in the centre of the city. Among the cities owning tramways, Sheffield promises to become the possessor of the largest number of municipally-owned omnibuses, for those which were introduced early in the year are giving results so satisfactory that the Tramways Committtee are engaged on a project for increasing the fleet, in order to link up districts from 12 to 15 miles beyond the boundaries. With this purpose in view the Corporation have included in their Parliamentary bill a clause to enable the vehicles to traverse outside districts. The invasion will be welcomed, for neighbouring authorities have had opportunities afforded them of becoming acquainted with the merits of the vehicles, while the city stands to gain additions to both its tramway revenue and its trade.

---

It is in effecting extensions of their transit facilities that numerous municipal and company tramways have found the internal combustion engine of great value, and the reports that will be forthcoming after the close of the year ending March 31 next will be a factor in determining the attitude of many other Corporations. It would add to the interest if during next year one or more municipalities adopted the suggestion made at the Municipal Tramways Conference by Mr. Fearnley, the general manager of Sheffield Corporation Tramways, for the testing of omnibuses on heavy traffic routes. In the interest of both the vehicles and the ratepayers it would be necessary to provide a suitable road surface, and if double-deck conveyances are run the material would have to be something more lasting than plain macadam. There need be no fear as to the popularity of "the poor man's motor car." An amusing instance of preference for the omnibus may be cited from Oldham, where two petrol-electric vehicles have been run in extension of a tramway route during and since the past summer. On their first and last journeys the machines are run over the tramway route to the depot, with the result that the tramcars lose custom, notwithstanding that a higher fare is charged for the competing vehicles. Early in the coming year an interesting experiment in motor traction will be initiated at Edinburgh, where in 1919 the Corporation will have to determine the future method of public transport on the termination of the company's lease of the cable tramways. As objection has always been taken to the overhead system for the city, the Council have decided to test six motor omnibuses on a southern route. A similar objection is responsible for Oxford still being served by horse cars. Offers by the National Electric Construction Company to provide potrol-electric tramcars on the inner route, and overhead for the outer sections, have been rejected, owing to trouble over penalties alleged to be due from the company for failure to carry out the electrification.

---

An excellent testimonial to the motor omnibus is given by the Oxford Tramways Company now offering to take up the horse tramways, to run omnibuses, and to pay a rental of £500 a year if the Corporation will hand over the sum of £20,000 for the company's tramway rights. Although the Tramways Committee recommended the acceptance of the offer, conditionally on the company paying a rent of £800 and the reduction of the sum payable by the Council to £15,000, the Corporation in General Purposes Committee have not accepted the recommendation. The company have embodied their scheme in a bill, to come before Parliament next year. Matters have been complicated by an Oxford resident having made application to the Watch Committee for licences to run Daimler omnibuses. The latest instance of a tramway company

# MOTOR TRAFFIC.

adopting omnibuses is to be seen in the Parliamentary application by the Norwich company, who intend to use them as an auxiliary to the tramways. One of the most convincing and concise statements yet written on the respective applications of the two forms of traction has been placed before the citizens by Mr. F. W. Ketley, the tramways manager and engineer. It is given in another column. Among Corporations already operating omibuses, Liverpool is about to increase the number of these vehicles run in connection with the tramways. This is in consequence of the good results already achieved. During a recent visit to London the Tramways Committee made provisional arrangements for the purchase of six omnibuses, including additional Tilling-Stevens petrol-electric, and others of petrol and steam propulsion. In addition to linking up the railway termini, the Tramways Committee are credited with the intention of experimenting with the omnibuses on certain tramway routes on which track renewals will be required shortly. The committee mean to investigate the motor omnibus question very thoroughly, and to put themselves in a position to supply any public demands that may arise in the same way as would be done by an enterprising company. It is a policy which deserves every encouragement.

In other countries the motor omnibus is also becoming popular. New York has services in Fifth and Seventh Avenues, and the omnibuses are so besieged by full journey passengers that the fare has been fixed at 5d. for the distance of seven miles. Application has been made by a new company for a franchise to run London-built vehicles, under which New York would be divided into two-mile zones, the fare to be 2½d. per zone with a free transfer to one other zone. Unlimited transfers are proposed for a fare of 5d., the maximum journey being 12 miles. London General vehicles are to be adopted in Montreal by the Canadian Autobus Company, whose president, Mr. D. Macdonald, an ex-manager of some of the old Paris tramways, and of the Montreal Street Tramways, has been making an investigation of the London services. Several omnibus routes are being worked in Melbourne by companies, and it is noteworthy that the Premier of Victoria is of opinion that if the new form of traction is not properly controlled it will prove a serious menace to tramway interests. This statement was uttered in the course of a speech which the Premier made in introducing a bill "to create and equip a new municipal organism within the metropolis for the discharge of and development of many important functions at present either dormant or in the hands of various local governing bodies." The Council is to be empowered to control omnibus traffic, and to prescribe the routes and areas in which the omnibuses may not run. The Council is also to have the right to construct and operate tramways when the company's lease expires.

Sooner than had been expected there is a likelihood of the Law Courts being called upon to consider one aspect of a refusal of local authorities to grant licences for the running of omnibuses. The question at issue is not that of competition with municipal tramways, but of granting licences to the Kidderminster and District Electric Traction Company. Kidderminster and Stourport Councils had both refused the company's application to be placed on the same footing as Messrs. Allen, of London, to whom licenses had been issued. A number of members of the first-mentioned authority were in favour of issuing permits to both companies, but the majority supported a motion by the Mayor that the outside company should be licensed to run to Bewdley, the Mayor stating that competition was required. When threatened by the Tramways Company with an application to the High Court for a mandamus, the Stourport Council decided to adhere to their previous decision.

The latest report of remunerative running of motor omnibuses by tramway companies was made at the annual meeting of the Provincial Tramway Company. It was then remarked that not only had mechanically-propelled road cars increased the profits but had warded off competition from the tramways. The latter experience fell to the lot of the Metropolitan Tramways Company in a remarkable manner on two or three days at the end of November, during an interruption of the Harrow Road section owing to a break down at the power-station. For 18 months the company has been running its own omnibuses on through London routes, as a unit in the allied companies, and during the cessation of the tramway traffic the void was filled by the loan of omnibuses by the London General Company.

## TO WEIGH MOTOR WAGONS.

At the International Road Congress a machine was exhibited that is being introduced in Lancashire, which ensures that the weight carried by heavy motors does not exceed the maximum laid down by the Heavy Motor Act, 1904, viz., eight tons on each axle. The machine can also be used to test the motor from time to time in order to ensure that the balance and lay of the machine has not been seriously affected by wear. The apparatus consists of two weighing platforms placed end to end, having capacities of 10 tons each with steelyards connected with each and one to take the combined load. The weight on either axle can then be read on either axle or the combined load by divisions of 7 lb. The machine is equally serviceable to weigh ordinary wagon loads up to 20 tons by 7 lb. divisions. There are no hand levers to be manipulated, no loose weights to be mislaid or misread, and the three steelyards are always in gear. At the time of weighing the weight is indelibly printed on a ticket. The machine has been installed at Darwen, and was manufactured by W. and T. Avery, Limited, Birmingham, and we are informed it has given complete satisfaction to the authorities.

Reduced Speed for London Omnibuses in a Kensington Street.—Application was recently made on behalf of the Royal Borough of Kensington, for the issue of regulations prescribing a maximum speed not exceeding eight miles an hour for motor 'buses, and 10 miles an hour for ordinary motor vehicles in Church Street, Kensington High Street, etc. At the inquiry held by the Local Government Board, the application was opposed by the Royal Automobile Club and the Automobile Association, while representatives of the Metropolitan Police expressed the views of the Commissioner against the proposed reduced speed limits. The Local Government Board have now intimated that they have decided to comply with the application so far as it relates to Church Street. When the necessary sign posts are ready for erection, the Board will issue an order restricting speed of all heavy motor cars (*i.e.*, over two tons in weight unladen) to eight miles an hour, and of other motor cars to 10 miles an hour. The Local Government Board have also issued an order reducing the speed of motor vehicles to 10 miles an hour in St. John's Road, Battersea, and to eight miles in the portion of Green Street, Bethnal Green, between Globe Road and Regent's Canal Bridge.

Brighton and Omnibus Transit.—The Brighton Corporation have decided not to make provision in their Parliamentary bill for the Council to insist upon the payment of a royalty, or a lump sum of money, or proportion of receipts, as a condition of granting licences to any omnibus company or to any other company seeking privileges in the nature of public monopolies.

# MOTOR TRAFFIC.

## TILLING'S NEW CHASSIS MODELS.

The advantage of motor vehicles where reliability is of the utmost importance is rapidly being recognised in all branches of public service, both for the conveyance of goods and passengers. The success of the motor omnibus has induced an increasing number of municipal authorities to consider the question of using motor vehicles for a number of purposes, with the result that in all departments the horse is being gradually superseded. With the railway companies the progress of the mechanically-propelled vehicle has been equally pronounced, and large numbers of machines of various types are now in regular use, both in town and country.

Where a time table has to be maintained reliability and simplicity of construction are essential points to be considered, and it is in this connection that the two models recently placed upon the market by Messrs. Thos. Tilling, Limited, of Peckham, should command the attention of all interested in the running of public service vehicles. Messrs. Tilling were amongst the pioneers of passenger transport in London, and their knowledge and experience in this direction is unique. In the field of motor traction they have to their credit the fact that they ran the first petrol motor omnibus service in London. To-day the most successful petrol-electric system is the Tilling-Stevens combination, and a large number of these machines are running most satisfactorily in London, Birmingham, Liverpool, Newcastle, and elsewhere. This system has become Messrs. Tilling's standard for their omnibus services, and is universally recognised as one of the most practical on the market.

Another important branch of Messrs. Tilling's business is the contract department, which includes the carrying of H.M. mails in various parts of the country. For this purpose a large number of vehicles of various makes have been running for some years past, and it was the valuable knowledge and experience gained in the running and maintenance of these conveyances, and of their omnibuses, that induced Messrs. Tilling to enter the field as manufacturers.

The new commercial chassis, known in the company's works as "B1" and "B2," were designed and built for carrying out a number of contracts for the conveyance of goods, and have now been running for a sufficient time to show that both from an economical and a reliability point of view they are far before anything which Messrs. Tilling have hitherto bought for doing the same class of work.

The "B1" is designed for carrying a useful load of two tons, and the "B2" for a load of one ton. The 2-ton type is now working in arge numbers for the Postmaster-General carrying the mails, and the London County Council are using several of them in connection with their stores department. Every part of the chassis has been built as a result of the experience of Messrs. Tillings's own requirements as operators, and the result is that the chassis as at present marketed are extremely simple, practically no expert attention being required in working them. Thus they are perfectly satisfactory even in the hands of very ordinary drivers.

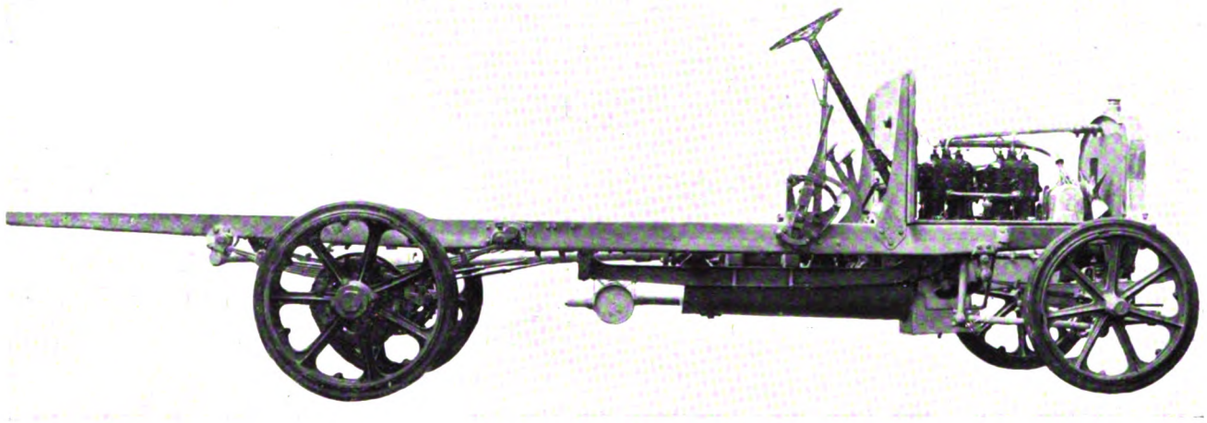

Fig. 1.—Elevation of Tilling's 2-ton Model Chassis.

The cylinders of the 1 and 2-ton vehicles are respectively 80 mm. by 120 mm. (15·9 Royal Automobile Club rating) and 90 mm. by 125 mm. (20·1 Royal Automobile Club rating) bore and stroke, and are cast in pairs. In the case of the 1-ton, thermo-syphon, and for the 2-ton model, centrifugal pump cooling is employed. A cross shaft driven by skew gearing is fixed in front of the engine, and has the pump at one end and Bosch waterproof magneto at the other end. It will therefore be gathered from this that these two important details are very accessible. All valves are interchangeable and on the near side, 3 per cent. nickel steel being used in their construction. Cast iron pistons are used having three compression rings and scraper ring situated low down in the skirt of the piston. These pistons with their rings have a weight limit, and any failing to be within a quarter of

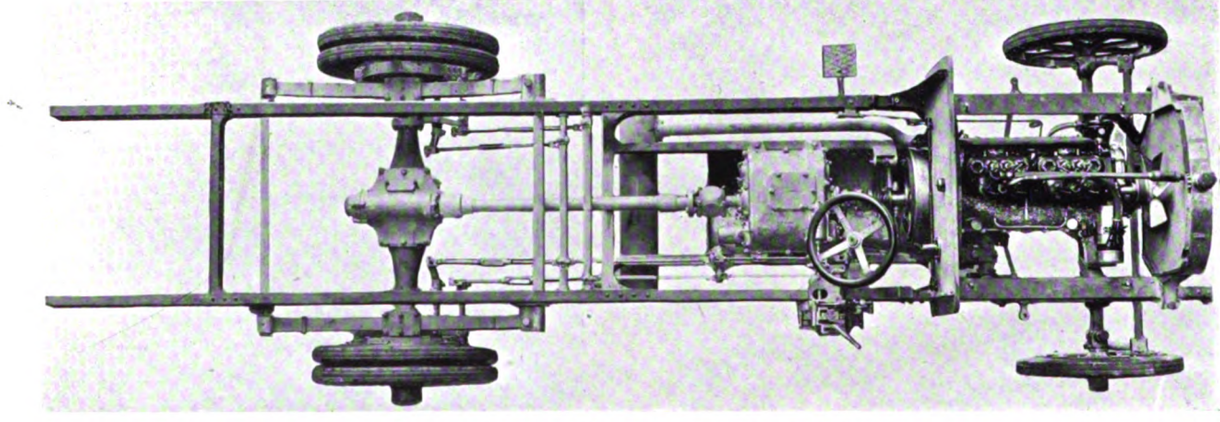

Fig. 2.—Plan of Tilling's 2-ton Model Chassis.

Digitized by Google

# MOTOR TRAFFIC.

an ounce are rejected. Stamped steel connecting rods, having white metal lined big-ends and phosphor bronze gudgeon pin bush, are used, and are all tested for both reciprocating and rotating balance on an Avery balancing machine. The crank shaft, constructed of chrome nickel steel, runs on three white metal lined bearings of ample size.

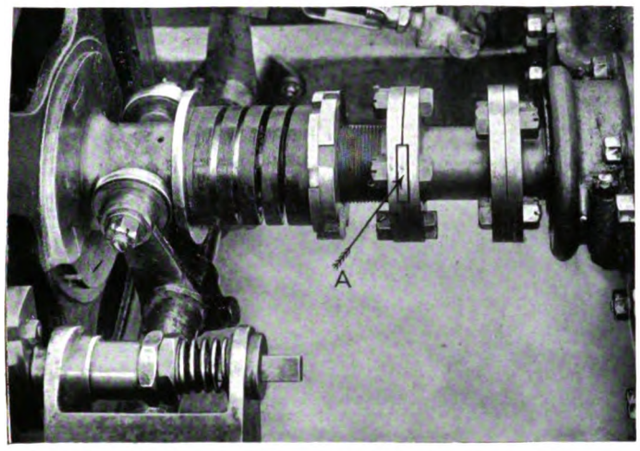

**Fig. 3.—Clutch Coupling**
(Showing key (A) through which the drive is taken).

The cam shaft, the cams of which are formed solid with the shaft, is also of chrome nickel steel, hardened and ground, the cams being ground on special machines to get the correct shape, every rotating and reciprocating part being balanced on special balancing machines. The oil pump is situated outside the engine, low down, and draws its supply from a large easily-detachable strainer, and delivers to pockets over the main bearings and troughs under the connecting rods, also to the timing gear case.

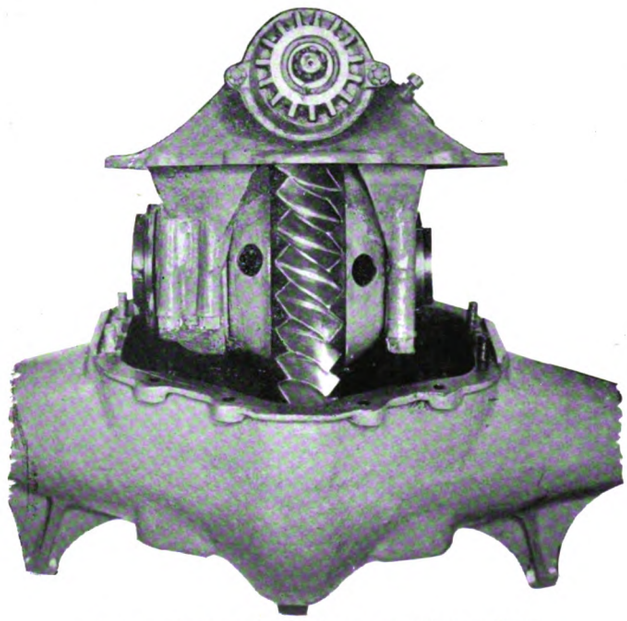

**Fig. 5.—Back Axle, Worm, and Worm Wheel**
(Showing Differential (raised) and Toothed Coupling to Propeller Shaft).

The "Solex" carburettor is fitted to both engines on the near side. This has a self-contained throttle, which is operated by a foot pedal only, the air being heated by the exhaust. Fixed ignition is employed, provision being made for the dual system, each cylinder being fitted with duplicate tappings for two sets of sparking plugs.

The "Megevet" type of radiator has been adopted. It is of large size, as indeed are all the water spaces, both in the cylinders and pipes. The method of mounting the radiator is of special interest, which is on the flexible principle. The anchor bracket on the off side of the radiator is provided with a shackle joint, the opposite bracket of which is bolted to the frame. This not only eliminates any straining action that may be set up, but also provides a means whereby the radiator may be swung over to one side upon removal of one bolt, thus leaving the front of the engine open for examination. The fan behind the radiator is

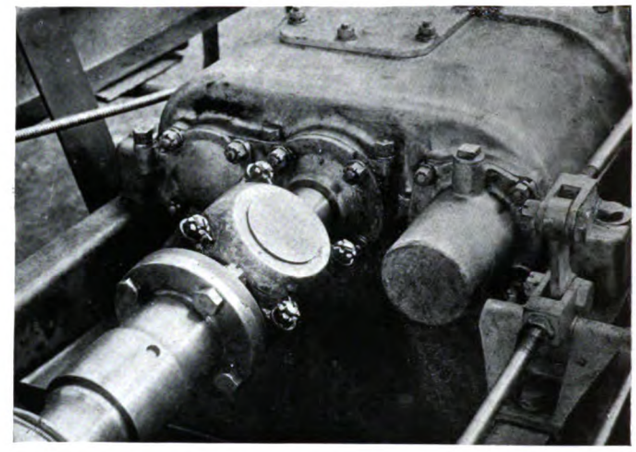

**Fig. 4.—Roller Bearing Universal Joint of Propeller Shaft.**

mounted upon an eccentric spindle, in order that belt adjustments can easily be made.

The transmission is through a leather-faced cone clutch of ample proportions. This clutch is so arranged that it can be dismantled when required without interfering with the gear box or engine. As

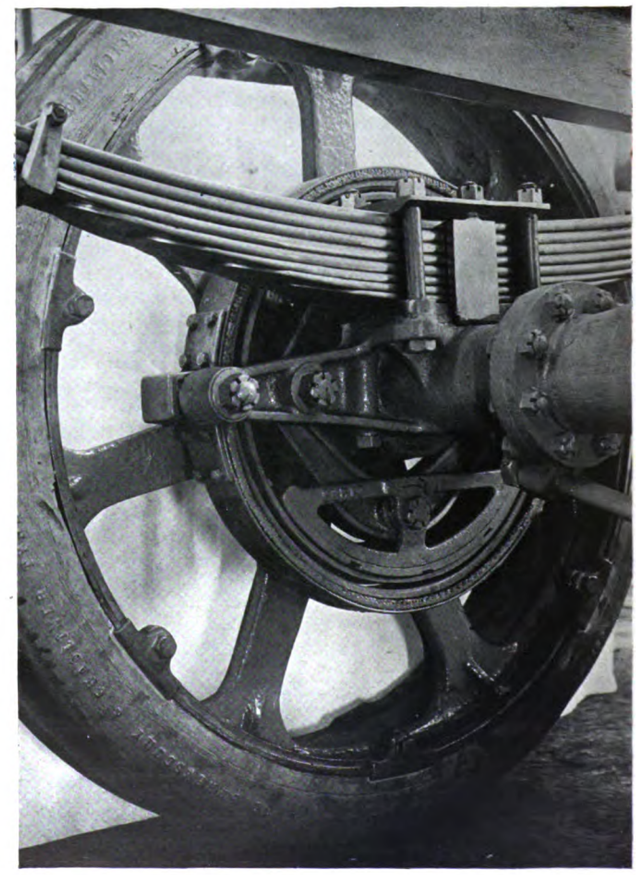

**Fig. 6.—Rear Road Wheel**
(Showing Separate Brake Drums).

will be seen by the illustration (Fig. 3), the clutch spring is easily adjustable by nuts, while the drive is taken through the key A and not through the bolts. This is clearly shown in the illustration.

Digitized by Google

# MOTOR TRAFFIC.

The clutch stop is adjustable without altering the initial tension on the spring. The engine is mounted upon two cross members, and the gear box on a sub-frame. On the 1-ton chassis the gear box is arranged to give three speeds, and on the 2-ton four speeds; in each case the direct drive is on the top speed, giving 18 miles per hour at the normal speed of 1,000 revolutions per minute. The shafts are short, and are

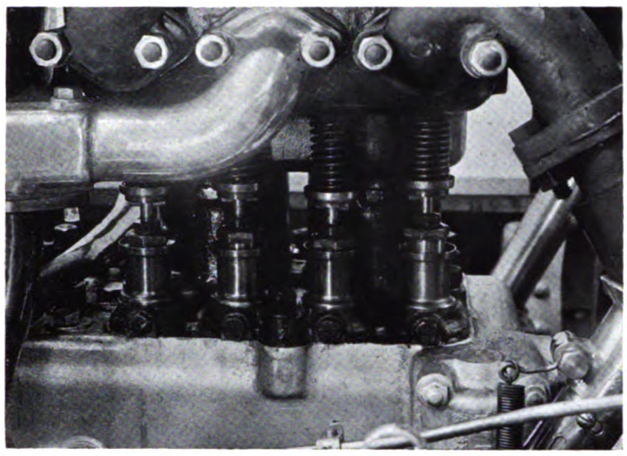

Fig. 7.—Rear View of Engine Showing Valves.

of chrome-nickel steel, with three ball bearings on each shaft. All the gears are of chrome-nickel, specially hardened and ground. The change speed lever has a free swing movement, and the shaft is entirely separate from the hand brake fulcrum bracket, so that it cannot bind when the brake is on. The drive between the gear box and rear axle is by tubular propeller shaft, having a roller bearing universal joint behind the gear box (Fig. 4), and has a sliding internal toothed joint at the front of the worm-driven axle. The final drive is by means of a worm

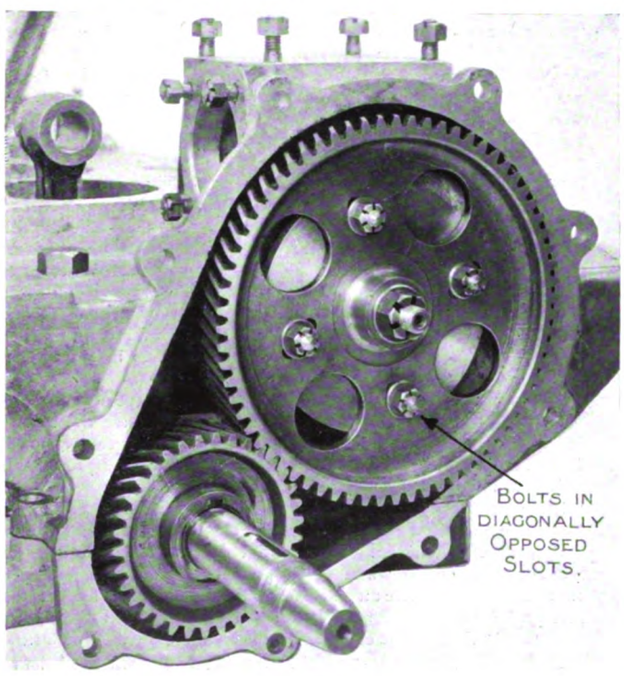

Fig. 8.—Timing Gear with Special Coupling to Cam Shaft.

and worm wheel arranged on the overhead principle. The worm is of chrome-nickel steel, case-hardened and ground, the worm wheel being of phosphor bronze. A mild steel casing forms a cover for the differential, and also encloses the worm gear.

No load is taken by the cross shafts, the whole being borne by the chrome-nickel steel tubes, which are machined from solid bars and run through spring and brake brackets into the cast-steel axle casing. The worm casing containing the overhead worm, worm wheel, and differential can all be withdrawn simply by undoing eight nuts and drawing the cross shafts (Fig. 5).

Special attention has been paid to the braking arrangements, which are on the dual system; separate drums are bolted directly to each of the rear road wheels, which have renewable wearing surfaces (Fig. 6). The internal expanding brake is operated by a foot pedal and the external contracting brake by hand lever, compensating gear being fitted to each. Cast-steel road wheels with floating phosphor bronze bushes are fitted to the front and rear of the 2-ton model, but in the 1-ton model "Timkin" roller bearings are fitted to the front wheels, and the phosphor bronze bushes to the rear wheels only. In both models chrome-nickel steel centres are forced by hydraulic pressure into the wheels and machined to a high degree of accuracy.

A number of other features, which are common to both models, are of special interest as showing that Messrs. Tilling as operators have found the necessity for making every part as simple and as accessible as possible. In the first place the whole of the valves, valve springs,

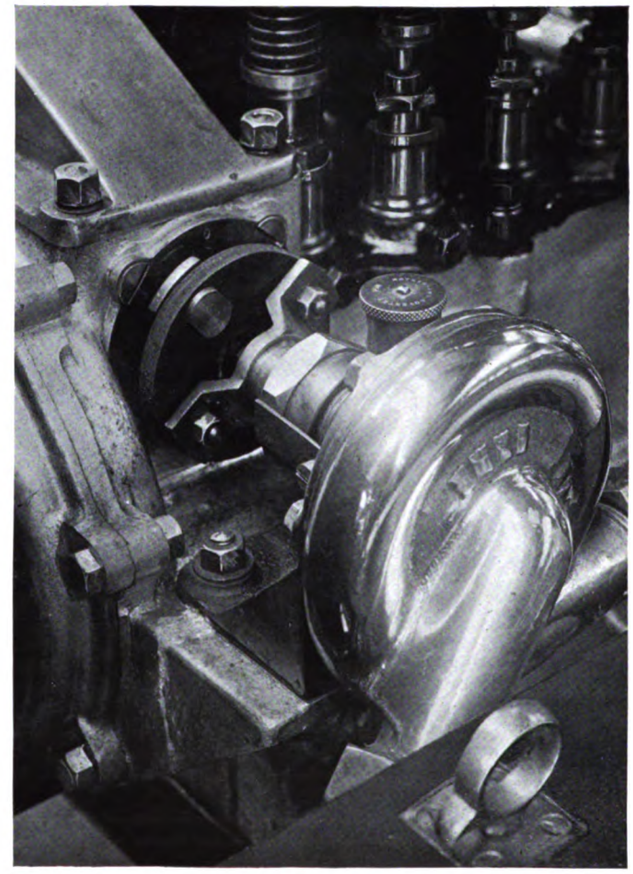

Fig. 9.—View Showing Leather Disc Coupling of Water Pump.

valve lifters, and valve lifter guides of the engine are in one unit, so that when the cylinders are lifted at any time the whole of these parts come away together, and every part is open for inspection and adjustment whilst on the bench (Fig. 7). The valve lifters are hardened and ground to fine limits, and, owing to their large diameter, wear is a negligible quantity.

One of the most important parts of any engine is the timing gear, and it will be agreed that in the case of the Tilling machines simplicity in design, combined with the best of materials and workmanship, make their timing gear equal to any on the market. The width and angle of the teeth give a smooth silky drive, and the ease with which the engine may be timed is due to the special form of coupling between cam shaft wheel and cam shaft. This coupling consists of a flange on the end of the cam shaft having four diagonal slots (Fig. 8); the cam shaft wheel, which is spigoted on to cam shaft, also has four diagonal slots, but in an opposite direction. It follows therefore that if the diameter of the pitch circle of bolts which hold these two parts together is increased or decreased the cam shaft is rotated slightly in an anticlockwise or

Digitized by Google

# MOTOR TRAFFIC.

clockwise direction. This adjustment, being made while the gears are in mesh, obviates the tedious method of pulling the wheel out of mesh, advancing or retarding one or more teeth as the case may be, and then putting into mesh again and trying the engine for timing. The water pump and magneto coupling is extremely simple, and consists of a leather disc which is absolutely silent and at the same time perfectly effective (Fig. 9).

Every detail in these chassis has received close attention. Thus each of the push and pull rods are fitted with spring ball and socket prints, while the wearing surfaces are hardened, and each lever is bushed with a hardened steel bush, and every pin is hardened. Messrs. Tilling have produced a chassis well worthy of their high reputation, and it is not surprising that the demand for both the 1 and 2-ton models has already outrun their expectations.

## INSTITUTION OF AUTOMOBILE ENGINEERS.

### Dr. Ormandy on Mixed Fuels.

The second meeting of the present session of the Institution of Automobile Engineers was held on November 12 at the Institution of Mechanical Engineers, Storey's Gate, S.W., when Dr. W. R. Ormandy read a paper entitled "Some Experiments with Mixed Fuels, with Special Reference to Alcohol Mixtures." The paper was an interesting description of tests made for the *Autocar* by the author, who advanced the following main conclusions to be drawn from the experiments:

(1) That an ordinary modern petrol engine will run on a half and half mixture of benzol and alcohol, and give just as much excellence in its more important working qualities as when running on petrol. (2) That variation of compression has a much greater influence on the success of alcohol than has hitherto been suspected, and this points to he necessity for scientific investigation on carburation with a view to more perfect gasification and reduction of throttling. (3) That progress towards the final goal of using alcohol virtually as a sole fuel is best sought by experimenting on mixtures containing gradually diminishing amounts of benzol, and that all the known data, properly attested, point to the fact that it is only a question of intelligent research to reduce the amount of benzol to a negligible quantity in proportion to the alcohol. Dr. Ormandy expressed gratification that the Imperial Motor Transport Conference had emphasised the necessity of pioneer work not only with a view to investigating the raw materials and the cost of production of alcohol throughout the Empire, but also in regard to the need for scientific and technical investigations in the direction of its correct use.

In the course of the discussion Mr. W. A. Hall remarked that much had been heard of the fact that alcohol had been produced at 6d. per gallon, and he was mystified as to why, if this was so, it was not done on the largest possible scale, having in mind the enormous demand for it.

Mr. A. E. von Groeling mentioned that a plan being tried at present was to mix Roumanian and American paraffin oil and treat it chemically, and by this means a tremendous percentage of petrol could be obtained.

Lord Montagu asked why the use of alcohol for internal combustion engines had not progressed to any considerable extent in Germany, where the Government gave a bonus to the production of alcohol from potatoes.

Mr. Horace Wyatt described the steps which the Imperial Motor Transport Committee were about to take in the matter of fuel research work, and spoke of the need for subscriptions.

Dr. Ormandy, replying, said he was sending off a quotation for a plant to British Nyasaland, to make 600 gallons of alcohol from maize, costing 16s. to 19s. a ton, according to the season. This would be 95 per cent. alcohol, and the actual cost would be 3d. per gallon. In Germany the use of alcohol was being somewhat restricted owing to a re-arrangement of the fiscal and agrarian policy of the Government, which had resulted in their refusing to do as they had done in the past, viz., sell alcohol at less than cost price with the view of developing districts from the agricultural point of view, which would otherwise not be able to maintain themselves.

### Summer Meeting in Belgium.

The council of the Institution have decided that the summer visit for 1914 should be paid to Belgium. It is probable that Brussels will be selected as the head-quarters, and excursions will be arranged from there to visit one or two motor car factories, steel works, stamping works, and works of makers of motor car parts.

A party of 24 of the graduates of the Institution accompanied by the president, paid a visit on November 22 to the works of Vauxhall Motors, Limited, at Luton. They were received by Mr. L. H. Pomeroy. One interesting fact came out in the course of a visit to the testing shops, Mr. Pomeroy informing the graduates that every engine sent out had first to be submitted to a test of half an hour's duration at 1,250 revolutions per minute.

Other papers to be read before the Institution this session will include two dealing with commercial vehicles. Tickets of admission to any lecture can be obtained on application to the Secretary, 13, Queen Anne's Gate, S.W.

## AUXILIARY TO NORWICH TRAMWAYS.

### Mr. T. W. Ketley Explains the Omnibus Scheme.

Norwich Electric Tramways Company are applying for Parliamentary powers to construct six new tramways and two doublings, and two deviations of existing lines. Further, they ask for sanction to run motor omnibuses and vans. Mr. T. W. Ketley, the general manager and engineer, has contributed to a local journal an article dealing with the motor traction portion of the bill, and in the course thereof he writes: "In Norwich take the case of St. Giles. Tramcars, each with a carrying capacity of 52 passengers, pass to and fro 34 times per hour during the working day. Granted the cars are bulky, but try and accommodate their possible 1,768 passengers per hour by means of any other vehicle, and it will be evident that this narrow street has not the necessary space to permit of it. Again, compare the room taken up in a street by a tramcar carrying 52 passengers, and a private motor car carrying four, or a carriage and pair carrying, say six, what a disproportion is seen! And yet one hears complaints that tramcars congest the streets! And this brings us to the consideration of the motor omnibus as a solution of the urban passenger traffic problem.

"The motor omnibus is usually designed to carry 34 passengers, as against 52 for a car. It is evident that more omnibuses than cars would be needed to deal with a given number of passengers. As an example (to refer again to St. Giles), to deal with 1,768 passengers we should need 52 omnibuses per hour as against 34 cars per hour, so obviously the omnibus would congest the streets even more than the cars do, and as omnibuses would have to travel more slowly than cars on the Guildhall Hill (because of their tendency to skid), the congestion would be even worse than shown by the above figures.

"But this is not the worst case against the motor omnibus when considered as a substitute for tramcars; the expense of running them for traffic such as Norwich provides is prohibitive. The running cost per mile of a motor omnibus differs locally, and not much reliable information is available. At a recent Municipal Tramways Congress where the subject of tramcar *v.* motor omnibuses was exhaustively debated, the cost of working a motor omnibus per 'bus mile was taken as 10d: this was held to be a fair figure. Personally, I think it is on the high side, and for our present purpose, we will put it at 9½d.

"Now, last year the Norwich cars ran 11,032,325 car-miles, and the average earnings over the last four years are only 8·19 pence per car-mile, and we have seen that we need, roughly, one-third more omnibuses to accommodate the passenger traffic if we provide the same accommodation and time schedule. So that this mileage must be increased by one-third if we substitute omnibuses for cars, making a total of 1,377,100 omnibus-miles, but as the earnings in Norwich are only 8·19 pence per tramcar-mile, and the omnibus costs 9·50 pence per mile to run, we should have a loss of 1·31 pence per omnibus mile when compared with present receipts. So that to give the Norwich citizens their present accommodation a loss of 1·3 pence per omnibus mile would result, and the total loss in a year on the present time schedule would amount to £7,516.

"It is regrettable that the motor omnibus has been dragged into the field as a competitor with the electric tramcar; on equal terms it cannot compete for long. There are localities which can be best served, or say adequately served, by omnibuses, and there one would without hesitation advise an omnibus service. But when the passenger traffic problem of a large manufacturing city is in case, there is, at the moment, only the electric car which can economically deal with it.

"The motor omnibus is so good in itself and so much needed in its proper sphere, that there was no need to clamour for its universal use. For suburban traffic it is excellent, and may soon be indispensable, but it never has and never can live on the tramcar fare basis; that is clearly demonstrated by the above figures.

"In Norwich we propose to give the motor omnibus its proper sphere, to use it as an auxiliary. Its functions will be to take care of super-traffic, to link up Norwich and outlying places—in fact, to be a free-lance, an extra mobile arm. And, when used in this way, Norwich will have a mixed system of tramcar and motor omnibus catering economically for it, whether the citizen be at work or play."

## OMNIBUSES OR RAILLESS CARS?

A Debate by Experts at Reading.

At a meeting of the Reading Chamber of Commerce in November the proposals of the Town Council to obtain powers for running railless trolley cars and motor omnibuses were discussed under the presidency of Mr. E. W. Ridley.

Mr. J. R. Dick, B.Sc., was the chief advocate of the railless trolley car, which, he said, could be steered as freely as the petrol type of vehicle. It was suitable for cross-country journeys to conections, or for extension at the ends of existing tramways into the less populous districts. The capital required per route-mile for electric cars with rails and permanent way was £10,000 to £14,000, and overhead equipment for trolley cars £1,000 to £1,200 per mile. Unless petrol omnibuses had very great financial advantages they would be undesirable, because they would interfere with the uniformity of the working of a tramway system. The electric method of power application was much more suitable for every-day use and heavy gradients than petrol engines. The vehicles were less subject to vibration and shocks, and were, therefore, more comfortable, and there was no skidding or undue wear on the roads or tyres. Speed adjustment with electricity was very easy, whereas with petrol engines it required expensive mechanism of clutches and change gear. Where a centralised production of electric power was possible, this system was undoubtedly superior to petrol omnibuses, each with its own engine. Electric omnibuses had very much less noise and no smell. Motor omnibuses might be useful in testing the traffic conditions on the routes to be run finally with trolley vehicles. The capital expenditure would be in the ratio of £700 to £750 for electric vehicles, and £750 to £850 for petrol omnibuses. The Local Government Board would only allow five years as the repayment period for petrol, as against 10 years for electric omnibuses. The overhead equipment could be taken up and reinstated on a new route without serious cost. In Reading the cost for current would not exceed ·8d. per mile, and this figure was not subject to such fluctuations as with petrol. Renewals of rubber tyres on electric vehicles was much less than on petrol vehicles on account of the smoothness of running. Insurance charges were much heavier with petrol, due to fire risks and accidents. A safe financial comparison of the two alternatives would be 7d. per mile for electric and 10d. for petrol. Some municipalities had been running petrol omnibuses at a cost ranging from 1s. to 1s. 3d. per mile, whereas with electric vehicles the tramcar total cost was just under 8d. per mile. The London General Omnibus figures for London had no real bearing on the working of a small system in a provincial town. The experience at Keighley, where the Corporation ran petrol omnibuses for four years and this year changed to trolley omnibuses, showed a cost of 1s. 3d. for the former as against 6½d. for the latter. The engineer estimated the wear of tyres and the road surface at the ratio of three to one in favour of electric vehicles. The trackless car was already well established in this country. Services were in operation at Leeds, Bradford, Dundee, Rotherham, Ramsbottom, Stockport, Keighley, and Aberdare, and other services were projected. In Reading the routes for further traffic development could be decided upon without much room for error.

### Petrol Traction "Cheaper than Bradford Railless?"

Mr. Horace Wyatt, editor of *Motor Traction*, maintained that many of the points made by Mr. Dick were applicable to the trackless trolley system—for instance, the way in which the cars would link up with existing tramways. In the event of Reading adopting single-deck trolley cars for all the routes, merely because a certain number of residents on some routes disliked double deckers, it would be bad policy. The double-deck vehicle, carrying 36 passengers, could be operated at a cost indistinguishable from that of the single-deck car carrying 28 passengers. Comparing double-deck vehicles in each case, the petrol motor omnibus had a great advantage over the trolley car. There would be very considerable difficulty in adapting the railless trolley system to double-deck cars on account of the height of the wires, and in order to keep the connections to the wires clear of the passengers on the upper deck. The trackless trolley system must necessarily cost more in the first instance than the motor omnibus. The cost of the overhead gearing and line was about £1,000 or £1,200 per mile. It was a surprise to him to hear the cost of electricity estimated at ·8d., because at Bradford the cost of electricity during the first year's working of the system came out at 1·22d., practically 1¼d. It would be fair to put the present price of petrol at 1s. 2d. per gallon. Nine miles to the gallon was a perfectly reasonable calculation, and that worked out as a cost of 1·5d. a mile. That was about a farthing less than the Bradford trolley car, and it referred to a 34-seated omnibus compared with a 28-seated car. They might leave the tyre question out, because it was customary not to buy tyres outright, but on a mileage guarantee, and manufacturers would not give a higher guarantee for the trolley omnibus than for the motor omnibus of modern construction Keighley had experimented with omnibuses for over five years. Therefore those vehicles were incomparable with modern motor omnibuses. As regards the cost of tyres, there was the petrol-electric omnibus. It would be absurd to say that it cost four times as much in road repair and tyres to run a petrol-electric omnibus as a trolley car. The London General Omnibus Company's figure for motor omnibuses was something under 7½d. a mile two years ago, and it was reported to have gone lower. The figure for Tillings, with a much smaller fleet, and allowing for petrol at its highest, was just over 7½d. a mile, and that figure, he was told, applied also to the service running in Birmingham. In London the average of stoppages of omnibuses was 12 per 100 000 miles covered, and the average time which the vehicle was kept out of duty owing to a stoppage was a little over an hour. These stoppages included not only mechanical breakdowns, but also any form of accident. The figures for the running of mail contracts by London firms showed about the same average of mechanical derangement—an almost infinitesimal one. The modern type of omnibus had very little tendency to skid. If petrol cost a little more at present than electricity, it did not necessarily imply that the petrol omnibus would cost more to operate than the trackless car, because the trackless system cost more initially. Whatever the regulations as to periods of loans might be, it was absurd to put the life of a modern omnibus at five years. The earning capacity of the motor omnibus was higher. One reason was that it could be used on many routes, and it would pay, because the upper deck would be filled on a good many days, especially if the 'buses were used for country trips. In Reading, omnibuses used on a holiday service to Ascot and to Henley would make a lot of money, and on Sunday trips could be run to the country. The difficulty of road repair and maintenance was the biggest argument against the trolley car. There were so few trolley cars running that it was difficult to say for certain if the trolley car would be a little cheaper to run, while the motor omnibus could be used on any routes to test and develop them, and if superseded could be withdrawn at a minimum cost.

### Opinions of the Chairman of the Tramways Committee.

In the course of the discussion Mr. W. Clayton said the mobility of the motor omnibus was a tremendous advantage, and it would not detract from the beauty of the town.

Alderman Cox contended that it was shown at the Municipal Tramways Conference that the London General Omnibus Company in 1912 put their running cost at 9⅜d., at Keighley it was 1s. 3d., Halifax 1s. 0⅜d., and Eastbourne 1s. 2¼d. The Corporation already had the motive power for trolley cars, and the more power they produced the cheaper it was.

Mr. S. H Hodgkin was surprised that practically nothing had been said about petrol-electric cars.

The Mayor (Alderman C. G. Field), who is chairman of the Tramways Committee, said he was surprised to hear that motor omnibuses could be run for 7½d. a mile. Tenpence was an unquestioned figure. Motor omnibuses were more liable to skid than trolley cars, which were lighter and much neater. He hoped that in Reading they would see no trolley arms whatever. What they had seen experimentally at the West Ham Conference of the Municipal Tramways Association, and the system of running in Vienna, was infinitely superior. There was practically no danger from a breaking of the wire, because the power was automatically shut off. The electric brake was not the brake that was usually applied on the existing cars, and he took it that it would not be the brake usually used on the trolley cars. The reason single-deck cars were proposed was simply on account of the low railway bridges. There was no reason why there should not be double-decks. It was an absolute fallacy to say that trolley cars would have to stop while passengers were boarding a car in front. They would have to stop if there was a trolley arm, but he did not think there was any likelihood of seeing the arm in Reading. They had ample surplus power for running trolley cars. He was not opposed to motor omnibuses as such, but he was of opinion that for economy and for easy travelling trackless cars were infinitely superior. As for scrapping, if they scrapped them in three years the Corporation would save more by scrapping trackless cars than by scrapping motor omnibuses.

Motor Owners' Petrol Combine.—An oil refinery is being erected at Thames Haven by the Motor Owners' Petrol Combine, in order to supply motorists with petrol from a source independent of any trust.

# MOTOR TRAFFIC.

## EDISON ACCUMULATORS FOR TRACTION WORK.

There is now a prospect of a substantial advance being made in this country in the use of the Edison accumulator for automobile road vehicles of various classes. On November 27 the new premises of Edison Accumulators, Limited, situated at 2 and 3, Duke Street, Piccadilly, London, were formally inaugurated. A large company of invited guests inspected the fine new building which has been erected, and made an examination of a number of motor cars fitted with Edison batteries and electric drive. Subsequently the guests were entertained to luncheon, Lord Montagu of Beaulieu, chairman of the company, presiding.

The company, after a preliminary period of organisation are now, we understand, in a position to supply various classes of electric vehicles, both for pleasure and industrial purposes. The Edison battery, in the meantime, will not be manufactured in this country, but will be imported from America. The vehicles themselves will, of course, be produced by various well-known British firms. Special attention, it is believed, will be devoted to industrial vehicles. The extraordinary durability and low cost of maintenance of the Edison storage battery, in which steel and nickel take the place of lead, are now well known.

Mr. W. R. Cooper, after luncheon, proposed the toast of prosperity to the Edison Accumulator Company. He said that this was the opening of a new era. It was the reincarnation of the electric vehicle in this country. The Edison cell suffered, perhaps, because it had a celebrated father. It had to live past the failures of previous cells, and it had also to live up to the reputation of Mr. Edison. The American reporters had succeeded in placing a halo of sensationalism around the Edison cell, which in some way made the position difficult. He wanted to emphasise the fact that the Edison cell was nothing sensational. Everyone knew that the reason why the electric vehicle failed in the past was that the lead accumulator required to be treated in a careful way, and in working it was impossible to give the necessary care to it. It was not necessary to decry the lead accumulator; there was ample field for both. But the fact that the lead accumulator failed in the past had left a certain scepticism behind, and the Edison cell had to live down that scepticism. When the Edison cell first came to this country he was sceptical about it himself, and it was only when he came into experimental contact with it that he came to the conclusion that the cell was worthy of its reputation. There were certain strong points about it, among which was the fact that it was made of steel instead of lead, and therefore must be stronger. Then it might be left in a discharged condition without injury resulting, which was impossible with the ordinary lead cell. It could be charged at a very high rate without doing any harm. That meant a material saving in time. In addition, it had a long life. These were decided virtues. He did not doubt that from this time forward the electric vehicle would make considerable progress. He thought the lead cell might take a part in that progress, but whatever part it did take it would be largely due to the opening made by the Edison battery. There were now 37,000 electric vehicles in the United States. A year ago there were only 20 makers of them in the United States, while now there were 37. Why should we not make similar progress over here? There were four parties to be considered in this country. First there was the general public, who would gain very materially by the spread of the use of the electric vehicle, especially in London. The second party was the buyer. The buyer held the purse, and if they did not give him what he wanted he would not pay for it. If they gave him the electric vehicle, they gave him something which he did want. The important point was that the electric vehicle was easy to manipulate. In the case of a small trader with two or three vans, it was rather a large question to go into the petrol vehicle, which required expert men, but if he got the electric vehicle he could use the men he had at present. It was only a question of handling the steering wheel, and that a man could master in a very short time. Then the cost of petrol was going up, and on the other hand the price of electrical energy was continually going down. The third party was the manufacturer. From that point of view the Edison battery was all right. The fourth party was the electric station engineer, who was going to supply the electric energy. If he did not supply it at a figure which would suit the buyer the electric vehicle was going to be of no use. In comparision with a few years ago, however, the position was entirely changed. Electric energy could be obtained at a penny, or even a halfpenny per unit. From the point of view of the central station man the electric vehicle load was not one to be despised. More apparatus would be sold, and more demands would come on the central station. Therefore, he would ask all parties concerned to pull together in this extremely important movement, the development of the electric vehicle. He had no doubt that if they did pull together there would be a very great development in the next few years.

Lord Montagu of Beaulieu, in responding, said that he was not prepared to make any extravagant claims for the Edison battery. He was quite sure it was good enough in itself to convert all those who used it to a favourable opinion of its merits. At the same time he would certainly not have had his name connected with this enterprise, nor would he have become chairman of the Edison Accumulator Company unless he had been convinced that the prospects of success were favourable, that the article was a genuine one, and that it had its chances to make good its claim to the public. When he was in the United States last year and visited Mr. Edison, nothing struck him more than the very large use of electric vehicles all over the States. Wherever he went he saw them used for certain specified purposes. Nobody would claim that the most perfect electric car fitted with the most perfect battery could take the place of the most perfect petrol car, but there was an enormous field for the electric vehicle where the petrol car was not being used. There was the electric runabout used by ladies in towns. It was a wonderfully useful vehicle for anybody who could not afford to keep a chauffeur, and was content with a speed up to 20 miles an hour. He had also seen the electric vehicle being used for the purpose of conveying heavy goods. He saw lorries working near docks in New York. He saw them working in the streets of Chicago, taking all sorts of produce for subsequent carriage by water or rail. There were 5-ton lorries and things of that sort. The merchants assured him that the goods could not be conveyed at such a cheap rate by any other means with which they were acquainted. These facts had converted him to the opinion that there was a field for the electric vehicle in this country. For runabout work in towns and for lorry work and light van work the electric vehicle had a very great future. Nothing would help to develop it more than the very reasonable charges lately made by the companies producing electric power. In some tests which were made last year by the Automobile Club with a vehicle which had a total weight, including battery and load, of 1·85 tons the watt-hours per ton-mile worked out at 3·32, the average speed per hour was 11·52 miles, and the efficiency of the battery was 60 per cent. The power was obtained at a halfpenny per unit, or ·167d. per ton-mile, or ¼d. per car-mile. In actual practice it would cost with a highly efficient petrol engine ½d. per car-mile, while the cost with the Edison battery was ¼d. He thought that the electrical vehicle was going to work out more cheaply for power than any other vehicle on the road.

Mr. Bernard Drake, who also replied, said that they had a considerable amount of prejudice to live down. He had been connected with electric propulsion since the earliest days. He thought that he built the first electric launch that was ever seen. Then he had helped to build tramcars, and drove the first one that was ever seen in Berlin. The first electric car seen in the streets of Berlin was an English-made one. He was at present manager of a lead accumulator company, and therefore his interests were somewhat divided, but he thought there was room for both. He was in America last May and was very much struck by the enormous number of accumulator cars. He interviewed some of those who were running them simply on the score of dollars. A brewery man told him that his firm had gone into the matter and had discarded the whole of their horses and gone in for electric trucks entirely. They had been running with the Edison accumulator for two years. When asked about depreciation, this gentleman said that he cared nothing about that, as in two years he wiped off the lot in his savings. Wherever he (Mr. Drake) made inquiries he was told that those who had tried the electric delivery van were quite convinced that it was the cheapest mode of moving a ton a mile. He was assured that in the case of 5-ton trucks 2½d. per car-mile covered the whole expense of running, including interest and depreciation. That was considerably lower than could be obtained with horses, or with petrol. A unit of electricity gave a horse-power for an hour. They required a pint of petrol to give about the same. Therefore, it lay with the electric supply companies to fix such a price for the charging current as would enable the electric vehicle to be a commercial success He was told in America that up to a year ago about one-third of the vehicle batteries in use were Edison, and two-thirds lead. Last year the proportions were half and half, and in the future it was expected that the lead battery would disappear, and that the Edison battery would have the field to itself. It was such statements that had induced him to come on the board of this company, and he felt sure that if the price of electricity was reduced to ½d., which the supply companies could afford to do, there would be a large load for the supply companies, who would be able to utilise their plant at night, and commercial electric vehicles would be as common before many years were over as taxicabs were now.

# MOTOR TRAFFIC.

Mr. SEABROOK, of the Marylebone electricity department, spoke of the improvement of the electric vehicle from the point of view of public health, and said that in Berlin petrol cabs would not be licensed now owing to the fumes which they produced.

Mr. ENGCUMBE, of the Kingston-on-Thames electricity department, said that the difficulty all along had been to get the batteries to stand the stress of traction work. He was sure they were satisfied that the Edison battery possessed those advantages of construction that would enable it to withstand that wear and tear. The question of the price at which electricity could be supplied was a very vital one, and one which he thought central station engineers could to a very large extent arrange with users of battery cars. The power-station engineers had, if possible, to show a balance on the right side, and though they would do their best he was not prepared to say that as a body they could get the price as low as ½d per unit. Possibly the figure might be between a ½d. and a 1d. The question of electrical vehicles was receiving close attention from the central station point of view. He had presided at a meeting at Kingston of about 400 engineers, where an excellent paper on electrical vehicles by two members of the staff of the Edison Accumulator Company was discussed. It had been a great surprise to the station engineers there to find what had been done in the matter in America, and it showed them that what had been done on the other side of the Atlantic could be done here. They saw that a new era had arisen, greatly due to the advent of the new battery. The result of that meeting was that the power-station engineers' association had formed an electric vehicle committee, and they had co-opted representatives from those interested in electrical vehicles and the supply of electricity. He had great hopes that the outcome would be the furtherance of the interests of the electrical trade generally.

## STRAKER-SQUIRE (1913), LIMITED.

Subscriptions were invited between November 25 and 28 for 75,000 shares of £1 each at par in the above company, which has been formed for the purpose (*inter alia*) of acquiring from June 30, 1913, as a going concern the business of Sidney Straker and Squire, Limited, the well-known manufacturers and traders of motor cars, motor vans, motor lorries, motor omnibuses, etc., and for the other purposes mentioned in the memorandum of association. Formed in 1901, Sidney Straker and Squire, Limited, have been successful in founding a sound and lucrative business, and the promoters state that the time has now arrived when the excellence of their work has stimulated orders to such an extent that they have quite outgrown the limits of their present capital, and an increase of the latter is essential to keep pace with the growing demands made upon their resources.

The particulars given as to the vendor company's heavy motor vehicle productions are of interest. The company was a pioneer of the industrial vehicle. Upwards of 1,000 commercial vehicles have been supplied to business firms in various countries, while Straker-Squire public service cars have been supplied to the number of 544 chassis for running in the following towns: London, Brighton, Cambridge, Gateshead, Bath, Ramsgate, Peterborough, Worthing, Newport, Birchington, Margate, Farningham, Yarmouth, Auckland, N.Z., Pretoria, S.A., Cairo.

Eighteen 4-ton lorries have been supplied to Arthur Guinness, Son, and Company, Limited, of Dublin; also to numerous other brewers, including Ind, Coope, and Company, Limited, D'Arcy and Company, Watkins, Pim, and Company, Wilkins Brothers, and Hudson, Limited, etc.

Ambulances, lorries, and other types of vans have been supplied to the War Office, the Admiralty, H.M. Gunpowder Factory, the Crown Agents, the Army Service Corps, foreign government departments, municipalities, etc. The Great Western Railway Company have in use and on order no less than 60 Straker-Squire delivery vans. Motor vans have also been supplied to the Midland Railway Company, the North Eastern Railway Company, the Great North of Scotland Railway Company, and foreign and colonial railway companies.

In addition to carrying on the works at Nelson Square, London, S.E., and the showroom, workshops, and offices for private cars at Shaftesbury Avenue, W.C., the company's cars of standard types are also to continue to be manufactured by Brazil, Straker, and Company, Limited, who have erected a new and up-to-date factory at Fishponds, Bristol. Messrs. S. Straker and L. R. Squire, the founders of the vendor company, are continuing their services as joint managing directors for a period of five years, with the option to the company to renew the agreement for a similar period. The vendors have agreed to sell the undertaking to the company for the sum of £55,000, payable as to £30,000 in cash, and as to £25,000 by shares. The profits for the past three years, after allowing for depreciations, but not including directors' fees, income tax and interest, are given as £9,656, £11,615, and £13,086, showing 20 per cent. on the purchase consideration of £55,000. The vendors estimate that the profit for the twelve months following the incorporation of the company will exceed £18,000.

## PETROL-ELECTRIC OMNIBUSES FOR EDINBURGH.

By a majority of one vote Edinburgh City Council have adopted a report presented by the Tramways Committee, recommending that tenders be obtained for three single-deck and three double deck petrol-electric omnibuses, in order to run a circular four-mile service from West Meadows, foot of Marchmont Road, eastwards to Hope Park, Preston Street, Dalkeith Road to Cameron Bank, Lady Road, Esslemont Road, West Mains Road, Blackford Avenue, Kilgraston Road to starting point on West Meadows. The Tramways Company have undertaken to work the vehicles, and to link them up with the tramways by means of transfer tickets. When the matter was before the committee it was agreed to by 16 votes to 12, and Councillor Harrison, who moved the proposal, estimated the cost of the vehicles at £5,100. The garage would cost £1,500. They had had, he said, various estimates with regard to the loss they would incur. Personally he did not believe the loss would be so great as their financial advisers stated. It was something worth risking a little money for, and it was a necessity for the city to make a forward step in this matter. At the meeting of the Corporation, Bailie Rusk said that if the Council did not undertake the project somebody else would, and then they would have to buy them out.

## OMNIBUSES OFFERED TO OXFORD.

Oxford Corporation have rejected, by 27 votes to 25, the proposal of the Tramways Committee in favour of accepting the National Electric Construction Company's scheme for running petrol-electric tramcars in the chief thoroughfares, and overhead trolley cars and motor omnibuses for other routes. The Council have decided to inform the company that the Corporation relied on existing rights as defined in several Acts of Parliament affecting the parties. An amendment to instruct the city solicitor to issue a writ forthwith for the recovery of the liquidated damages was defeated. Several members advocated the use of motor omnibuses, and two colleges sent letters in support of that idea, but it was stated that this course could not be followed unless the horse tramways were purchased at a cost of £28,000. Alderman Carter mentioned that he had received several offers from omnibus companies to come to the city.

Subsequently the National Electric Construction Company made an offer to drop the tramway electrification proposals, and to substitute a motor omnibus service, paying the Corporation £500 a year as rent. In return they asked the Council to pay £20,000 for the existing horse tramways, excluding horses, cars, etc., the rails to be taken up. The Tramways Committee recommended the acceptance of the offer, provided the company paid £800 a year rent, the sum payable by the Corporation to be reduced to £15,000. The General Purposes Committee have decided against the recommendation.

The City of Oxford Electric Tramways Company have since notified that they are applying for Parliamentary powers to enable them to run omnibuses, to pull up the tramway lines, and to enable the Corporation to purchase the horse tramways.

Mr. W. R. Morris, the owner of a local garage, has applied to the Watch Committee for licences to run two Daimler omnibuses.

## DENNIS BROTHERS (1913), LIMITED.

The first annual general meeting of this company was held on November 20, at the Cannon Street Hotel, E.C., Mr. G. Clare presiding. The report stated that for the year to September 30 the net profits were £43,249, from which must be deducted net earnings to March 31, 1913, which, in accordance with purchase contract, were paid over to vendor company, £20,754, leaving £22,495. The directors recommended payment of dividend at rate of 1s. per share, equivalent to 10 per cent. per annum, from March 31, 1913, to September 30, 1913, £15,000; and to place to reduction of preliminary expenses and underwriting commission, £5,000, leaving £2,495, carried forward.

In moving the adoption of the report, the chairman said the anticipated profit, as set forth in the prospectus, based on the letter addressed to the directors by Messrs. Dennis (the joint managing directors of the vendor company), was over £50,000. The result of the year's working had not belied that forecast. The year's operations had yielded a net profit of £43,249, but if the directors' fees of £1,062, and the salary and commission of £6,805 payable to Messrs. Dennis were added, it would make a total of £51,116. This result was two-thirds as large again as the average profit of the three preceding years, and was also greater than the profits earned in 1910 and 1911 put together. The commercial vehicle branch of the motor trade as yet had only crossed the outer fringe of the possible market. What had taken place with regard to the transport of passenger traffic in the great cities of the world was rapidly taking place in regard to the transport of merchandise, and the directors viewed the outlook with confidence. As to competition, they were probably as well equipped for self-defence as any firm in Europe.

# MOTOR TRAFFIC.

## LONDON MOTOR FIRE VEHICLES.

In the course of a paper read at the International Association of Fire Engineers, recently held at New York, by Mr. A. R. Dyer, A.M.I.C.E., of the London Fire Brigade, the author gave an interesting account of the various motor vehicles and appliances in use in the Brigade. Mr. Dyer said that perhaps the most successful type of appliance to be introduced has been the electric motor escape van, for service in localities where only moderate gradients are encountered, the first vehicle of this kind being obtained in 1911. The power is provided by a battery of 84 cells of 195 ampere hours' capacity, giving a normal running output of about 30 H.P.

The appliance runs about 30 miles on one charge if necessary, but owing to the nature of its service it stands fully charged ready to give out the maximum output on receipt of a call. The motors are in the front wheels, the fields being fixed to the stub axle, around which the armature revolves with the wheels. The tyres are single 5 in. on all wheels. There are electric brakes on the front wheel motors, which are valuable in emergencies, whilst two mechanical brakes on the rear wheels are sufficient under ordinary circumstances. The control is of the series-parallel type, with five notches forward and reverse, and two brake positions.

The weight of the appliance ready for running, but without ladders, hose, and small gear and men, does not exceed 8,300 lb., the total weight of the machine complete being about 11,800 lb. A speed of 25 miles per hour is maintained with full load on a level and good road, and the machine is capable of ascending a gradient of one in eight, fully laden, at a speed of about six miles per hour, or a moderate gradient at 15 miles per hour. The weight of the appliance fully laden is about 600 lb. more than a corresponding petrol van.

Undoubtedly petrol motor-escape vans are required for localities where stiff gradients have to be encountered. The type found to be satisfactory has the following general features: Four-cylinder engine, 6-in. bore by 5½-in. stroke, giving about 50 B.H.P., double ignition, *i.e.*, Bosch magneto and accumulator and coil; speed about 30 miles per hour. The engine is started up in the station every four hours, day and night. Where the engine room at the station is not warmed with hot water or gas radiators, electric heaters are hung over the front of the radiator to warm the engine and keep it ready for an immediate start in cold weather. The appliance weighs about 11,200 lb. fully laden, and has 4½-in. tyres on front wheels and 5½-in. on rear.

The first lorry to be procured was a standard 5-ton (11,200 lb.) machine from one of the largest lorry builders. It is fitted with a 4-cylinder engine, 5½-in. bore, and 6½-in. stroke, having an output of 55 B H.P. at 1,000 revolutions per minute, and is capable of a speed of 30 miles per hour. It is fitted with 5-in. tyres on front wheels, and twin 5-in. on rear. No non-skids are provided. A covered hood is fixed.

A second lorry has been ordered. This will be of the standard 3-ton (6,720 lb.) type, similar in most respects to the larger machine. It will have a 4-cylinder engine, 4¾-in. bore, and 5-in. stroke, giving an output of 45 B.H.P. at 1,000 revolutions per minute. Those at present in use for carrying principal officers to fires and other work are standard chassis by well-known makers. In one case large pneumatic tyres, 35½ in. by 5½ in. (895 by 135 mm.) are fitted, with detachable rims. On this machine four men are carried besides the gear mentioned previously (the total weight being 4,410 lb.) and no trouble has been experienced with the pneumatic tyres. Indeed, the instruction tender, which is of similar pattern and drive, has also been recently adapted for pneumatic tyres instead of solid ones.

Interesting details were given by the author of the means adopted for the prevention of skidding, and he stated that one appliance has run for a year without non-skids, but with soft rubber tyres of flat tread and extra wide section, single on front wheels and twin on hind wheels. Although no skidding has taken place, there is still some doubt if fire engines can be safely run under all conditions in London without some non-skid attachment. Front wheel brakes were tried on the appliances supplied by different manufacturers in 1910 in order (it was hoped) to obviate the effects of skidding, but whilst satisfactory results were obtained on tests, they were found unsuitable in practice, and have now being removed from the appliances, and rear wheel or differential brakes fitted instead. In the early stages of motor traction no saving was shown by its use, but with the improved standard commercial type chassis, and the continued experience of the drivers, there is undoubtedly a saving effected by the use of motor appliances.

MOTOR VEHICLE FOR SMOKE HELMET WORK.—London County Council at a meeting on November 25 agreed to obtain a motor vehicle specially designed for use in connection with smoke helmet work, in place of a horse-drawn engine, from Dennis Brothers, at £1,150.

## IMPERIAL MOTOR TRANSPORT COUNCIL.

This council has been formed, as a result of the unanimous desire of upwards of 200 Colonial delegates, who attended the Imperial Motor Transport Conference held in London in July last. The council will work in close touch with the Royal Automobile Club, the chairman of the club (Hon. Arthur Stanley) being also chairman of the council, and the meetings of the council being held at the club.

To enable the council to deal promptly with inquiries relating to the selection of industrial motor vehicles for service abroad, or the operation of vehicles in such service, a small Technical Inquiries Sub-Committee has been formed. This sub-committee consists of: Mr. W. Worby Beaumont, consulting engineer to the Chief Commissioner of Police and to the Royal Automobile Club (chairman); Mr. Ashton M. Heath, chief inspecting engineer to the Crown Agents for the Colonies; Mr. H. E. Wimperis, inspecting engineer to the Crown Agents for the Colonies; and Mr. Horace Wyatt, who will also act as hon. secretary of the sub-committee.

The council are in course of forming an Alcohol Motor Fuel Committee in accordance with the request of the delegates. This committee will conduct investigations and experiments relating to the use of alcohol as a motor fuel, the general opinion having been expressed by the delegates that considerable support would be forthcoming from the Dominions and Colonies in aid of work assisting towards the production of a permanent adequate suppiy of fuel within the Empire.

The principal objects of the Imperial Motor Transport Council are:

(I.) To act as a clearing house on all matters relating to motor transport throughout the Empire. To advise and consult with associated bodies and correspondents throughout the Empire who may require information on questions coming within the scope of the council, or who may desire to put before manufacturers statements of the conditions and requirements existing in various portions of the Empire.

(II.) To organise further conferences when such appear advisable in the interests of manufacturers and users.

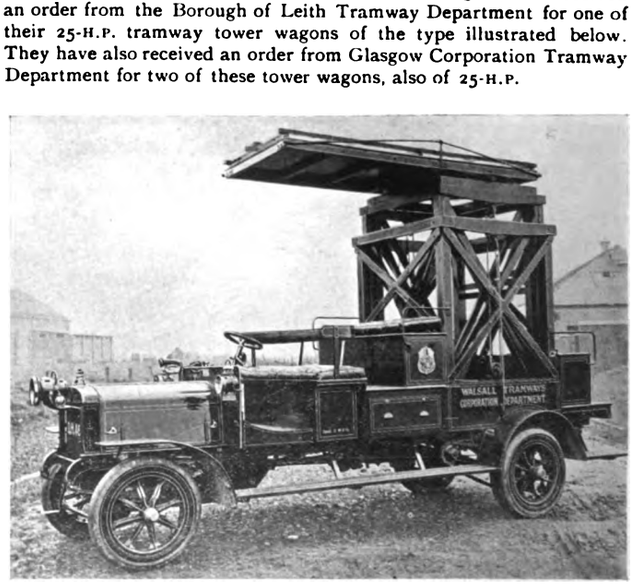
(III.) To form expert committees to consider any special matters of importance to which the attention of the council may be drawn by corresponding members or associated bodies.

(IV.) To publish periodical reports from information received through the medium of a system of correspondents throughout the Empire, and to arrange for the publication of matters relating to motor transport which would benefit by publicity.

The representatives of the Society of Motor Manufacturers and Traders on the Council are Messrs. S. F. Edge (president), E. Manville (ex-president), Sidney Straker (chairman of the Commercial Vehicles Committee, managing director of Messrs. Sidney Straker and Squire, Limited), Raymond Dennis (managing director of Dennis Brothers, Limited), F. Churchill, and R. Barry Cole (sales manager, Commercial Cars, Limited). The hon. secretary to the council is Mr. Horace Wyatt.

## MOTOR TOWER WAGONS FOR LEITH & GLASGOW.

Halley's Industrial Motors, Limited, of Yoker, Glasgow, have received an order from the Borough of Leith Tramway Department for one of their 25-H.P. tramway tower wagons of the type illustrated below. They have also received an order from Glasgow Corporation Tramway Department for two of these tower wagons, also of 25-H.P.



Type of Hallay Tower Wagon for Leith and Glasgow.

# MOTOR TRAFFIC.

## MOTOR TRAFFIC NOTES.

MOTOR OMNIBUSES IN LONDON.—On September 30 the number of motor omnibuses licensed in London was 3,319.

POST OFFICE AND MOTOR TRACTION.—The authorities of the General Post Office in London are carrying out trials with a three-wheel electric delivery vehicle.

PETROL-ELECTRIC VEHICLE FOR PIETERMARITZBURG.—A 40-H.P. petrol-electric chars-a-banc has been ordered by the Pietermaritzburg Council, to be used in testing the traffic value of the various routes in and about the city.

AN ARGENTINE OMNIBUS SCHEME.—The Rosario Municipality has been informed by a firm in Buenos Ayres that they will shortly lay before the Council a proposal for the establishment of motor omnibus services in that city.

AN OMNIBUS QUESTION AT LINCOLN.—The Town Council has instructed the Electricity Works Committee to inspect systems of motor omnibuses and trolley vehicles, with a view to the promotion of a Parliamentary bill in November, 1914.

MOTOR VANS FOR VICTORIA.—The Victorian Railway Department have decided to inaugurate a system of parcels delivery by motor vans in Melbourne and in large provincial centres, in connection with the parcel-carrying business of the department.

ANOTHER ALL-NIGHT LONDON OMNIBUS SERVICE.—On the night of November 13 the London General Omnibus Company instituted a second all-night service of motor omnibuses—No. 94A—between Willesden and Liverpool Street. The service is half-hourly.

OMNIBUSES IN RANGOON.—The Electric Tramway Company appear to be meeting with success in the services which they have started with four Daimler 40-H.P. omnibuses. The vehicles are fitted with the C.A.V. electric lighting sets. The fare is one anna for the whole distance.

MOTOR TRACTION FOR NORTHWICH.—Leading men of this Cheshire town met publicly at the end of November and agreed to form a motor omnibus company with a suggested capital of £10,000. Twelve members of the Urban Council put their names down as investors of a total of £1,200.

PETROL-ELECTRIC OMNIBUS FOR LEEDS.—During November a Tilling-Stevens petrol-electric omnibus was placed in service between Moortown and Shadwell by the Leeds tramways department. The vehicle was supplied by W. A. Stevens, Limited, Victoria Street, Westminster, S.W.

WOLVERHAMPTON OMNIBUS SERVICES.—As it is their intention to submit at an early date a scheme for establishing a motor omnibus service between Queen's Square and the borough boundary at Compton Road, the Tramways Committee have refused to grant a licence to Mr. J. Beddard to run a similar service.

LONDON TRAFFIC COMPETITION AND TRAMWAY ASSESSMENT.—The rateable value of the London County Council tramway lines in the borough of Deptford has been reduced from £12,263 to £2,250 in consequence of the falling off in the receipts of the tramways, attributed, among other things, to omnibus competition.

DEMAND FOR WORKMEN'S FARES ON OMNIBUSES.—The National Association for the Extension of Workmen's Trains and Tramways have passed a resolution demanding that motor omnibus companies should be called upon to grant cheap fares to workpeople similar to the workmen's fares on the London tramway system.

MOTOR LORRY FOR LONDON FIRE BRIGADE:—At a meeting of London County Council on November 18 the Fire Brigade Committee recommended that an offer amounting to £615 by Dennis Brothers to supply a motor lorry for use in connection with the New Cross fire station should be accepted. This was agreed to.

NOTABLE ORDERS FOR LEYLAND VEHICLES.—Nottingham Corporation have purchased from Leyland Motors, Limited, two street-watering tank vehicles supplied with interchangeable refuse bodies. The company have received an order from the War Office for 55 lorries, making a total of 120 of these vehicles for military service.

SIZES OF SOLID TYRES.—The Solid Tyre Sub-Committee of the Society of Motor Manufacturers and Traders have presented a recommendation to the Commercial Vehicle Committee in favour of six wheel diameters, ranging from 670 mm. to 880 mm. The latter committee are obtaining the views of all members of the section on the proposals.

OMNIBUS CREATES TRAFFIC ON TRAMCAR ROUTES.—"One of those controlling London's tramway system" is reported as saying: "The panic talk as to the era of the tramway car having passed was unwarranted. The novelty of the motor omnibuses having worn off, the public are going back. The motor omnibus has also created traffic on the tramway car routes."

THE GRAVELEY SPLASH-GUARD.—The Graveley splash-guard, adopted by Messrs. Tilling, was mentioned at a meeting of Teddington Council when complaints were made of splashing by omnibuses. It was stated that this guard effectively prevented the nuisance, and the Council decided to request the omnibus company to adopt it on the vehicles running through Teddington.

ELECTRIC VEHICLES AT THE MOTOR CAR EXHIBITION.—Edison Accumulators, Limited, exhibited at the Motor Show at Olympia, on the stand of Messrs. Arrol-Johnston, a three-passenger Edison accumulator car, and they also had a number of similar vehicles outside for purposes of demonstration. The company's vehicles are attracting increasing attention, owing to the excellent results obtained from those in service.

MAIDSTONE AND DISTRICT MOTOR SERVICES.—This company have inaugurated two new services between Maidstone, Cranbrook, and Sittingbourne, which enable passengers to travel in a more direct route than is possible by railway, and also to avoid the changes of carriage that are necessary on the railway journey. One of the company's chars-a-bancs—a Leyland—is being used for Sunday trips to the seaside at Hastings.

ROADS FOR THE OPENING UP OF VICTORIA—The Country Roads Board, which was recently appointed in Victoria, after deciding what roads shall be declared main roads, are proposing to expend £2,000,000 on road construction during the next five years, half the sum being provided by the State, and half by the municipalities in the form of a loan payable in 31½ years. The conditions permit of the choice of a ruling gradient of 1 in 20 on the principal main roads.

A WELSH OMNIBUS SERVICE.—On November 24 an extension of the Llandudno-Conway motor omnibus service was made to Penmaenmawr. The distance of the entire route is nearly 10 miles. Seven journeys are made each day, with an extra run each way on Wednesdays and Saturdays. A special omnibus leaves the Grand Theatre, Llandudno, for Conway and Penmaenmawr when performances are given at the theatre. The services also cater for golf players at Conway.

STRAKER-SQUIRE ENTERPRISE.—Messrs. Sidney Straker and Squire, Limited, have appointed the F.D. Motor Company to be local representatives for Straker-Squire commercial vehicles at Liverpool. The agency for Monmouthshire and Glamorganshire has been awarded to Mr. J. A. Thomas, of Cardiff. A repeat order for two 3-ton lorries has been received from Ind, Coope, and Company, and a number of vehicles have been sold to the British-American Tobacco Company, Liverpool.

THE PROFIT ON A MOTOR CAR.—Before Mr. Under-Sheriff Burchell and a jury at the London Sheriff's Court, on November 12, Messrs. S. F. Edge, Limited, sued Mr. J. T. Pomar for damages for breach of contract. For the plaintiffs it was said that defendant agreed to buy a 30-H.P. Napier for £891, but he failed to carry out the agreement. The chassis and body cost Messrs. Edge £613, and they contended that they had lost £278 profit through the breach of contract. The jury assessed damages at £100.

ALUMINIUM IN THE CONSTRUCTION OF MOTOR VEHICLES.—An instructive booklet dealing with this subject has been issued by the British Aluminium Company, Limited, 109, Queen Victoria Street, E.C. One of the illustrations shows the aluminium panelling on a large chars-a-banc constructed by Leyland Motors, Limited, and reference is also made to the suitability of this metal for use in railway cars, and for motor engine and other castings. Some useful hints are given on working aluminium.

TRIAL OF OMNIBUSES IN AUCKLAND.—At the request of the authorities of the Exhibition held in Auckland (N.Z.), the Tramways Company put on a service of six motor omnibuses. Mr. C. G. Tegetmeier informed the shareholders at the annual meeting held in London, that although the directors did not think there was scope for the profitable operation of omnibuses, yet, if there should be an opportunity in the future of running motor vehicles to advantage, the company was not likely to leave it to others.

TILLING-STEVENS OMNIBUSES FOR JOHANNESBURG.—An order has been given by the Johannesburg Council for four more Tilling-Stevens petrol-electric omnibuses. For the bodies local tenders have been invited in order that local experience may be utilised to secure a body suitable to the climate. The decision to purchase the vehicles was

Digitized by Google

# MOTOR TRAFFIC.

arrived at on the recommendation of the tramways manager after the experience of the running of a petrol-electric and another type of machine purchased in March last.

Omnibuses to Test Routes at Salford.—In explaining the intention of the Tramways Committee to apply for powers to run omnibuses, Alderman Linsley, chairman of the Tramways Committee, has stated that they desired to find out whether it would be worth while to construct tramways along various routes. The omnibuses would also serve to feed the tramways. The committee had been asked to extend the tramways to Irlam, but they could not do so because it would involve a loss. That was an instance where omnibuses might be useful.

Gateshead Tramway Company's Omnibus Services.—The motor omnibus service recently instituted between Scotswood, Blaydon, and Swalwell has been extended to Dunstan. For the whole distance the fare is 5d. An application to the Newcastle Tramways Committee for permission to run omnibuses over the Scotswood Bridge has not been entertained.—Stanley Council, after discussing their failure to secure adequate concessions from the North Eastern Railway Company, decided to invite the Gateshead Tramways Company to consider the question of running omnibuses in the district.

The New Surveyor for Kent.—In consequence of the appointment of Mr. H. P. Maybury to the post of chief engineer to the Road Board the Kent County Council have chosen Mr. H. T. Chapman, county surveyor of Somerset, to fill the vacancy. The salary will be £800, as against £600 Mr. Chapman has received in Somerset, and £1,500 paid to Mr. Maybury. The latter gentleman had long made the roads of Kent most favourably known among motorists, and of late years he has not been unsuccessful in providing a surface that will stand the wear imposed by heavy vehicles from the London area.

Yorkshire Tramways Company's Omnibuses.—A service of 40-h.p. Daimler omnibuses for the Cleckheaton district has been instituted by the Yorkshire (Woollen District) Tramways Company, Limited, who operate the electric tramways between Cleckheaton and Dewsbury. The vehicles serve the outlying districts of Scholes, Oakenshaw, Hightown, and Gomersal, connecting with the company's tramways at the two latter places, as well as at Cleckheaton. At a trial run on November 17 Mr. E. A. Paris, the tramways company's manager, gave a 20-mile journey to the members of the Cleckheaton Council and their ladies. The vehicles seat 30 passengers.

The Omnibus Question in Cape Town.—Reference was made at the annual meeting of the Cape Electric Tramways Company, held in London, to Greater Cape Town having been brought into being. The chairman mentioned that sufficient knowledge had been gained to convince the board that for a regular town service motor omnibuses were not required. The service to the docks, where the company possessed no tramway, had shown poor results, and would be discontinued if it were not better patronised. So far as they could see, however, motor omnibuses answered well in suburban districts as feeders for the tramways, and also for pleasure traffic on certain routes round the peninsula.

Liverpool Purchasing More Omnibuses.—Owing to their satisfactory experience with a Tilling-Stevens petrol-electric omnibus on the Garston route, the Tramways Committee are proposing to increase the omnibus service in the city. On November 17 members of the Committee visited London in order to inspect omnibuses of various types likely to suit the conditions obtaining in Liverpool. It is proposed to institute a service on the Ullet Road route to Wavertree from the Dingle, and afterwards to link up the three railway termini. Orders have been placed by the City Council with W. A. Stevens, Limited, the Brush Electrical Engineering Company, Limited, and Straker and Squire, Limited, for the supply of two motor omnibuses each.

Montreal Tramways Company Propose an Omnibus Route.—The directors of the Montreal Tramways Company do not seem disturbed at the reported intention of local and London financiers to seek to run a motor omnibus service with vehicles made by the London General Omnibus Company. Mr. E. A. Robert, the president, on November 13, presented an offer to the Board of Control for a 40 years' franchise, and said the company would construct more surface lines and several underground lines in return for the city making a number of street widenings. Mr. Robert also suggests a motor omnibus service for Sherbrooke Street. The company, he suggests, would pay the city 4 per cent. on all gross traffic earnings.

Electrical Ambulance for Asylum Work.—Recent developments in electric traction have led the Metropolitan Asylum Board to decide to make an experiment with an electric ambulance. Hitherto petrol-driven vehicles have been utilised, but the Ambulance Committee have reported they have always recognised that electricity provided the most suitable form of traction for ambulances employed in the conveyance of acute cases. On the recommendation of the Committee the Board have decided to purchase from "Cedes" Electric Traction, Limited, two chassis for £265 each, and two batteries for £85 each. These would be gearless and silent in operation. "Cedes" vehicles have for some time been in use in the London Fire Brigade.

Greater Omnibus Services, Limited, has been registered, with a nominal capital of £100 in 2,000 shares of 1s. each, to carry on the business of motor car and omnibus proprietors, etc., and to enter into an agreement with General Omnibus Supply, Limited. The directors are Stuart A. Curzon and Cecil S. Windsor, both of 98, Victoria Street, S.W.; F. W. Sanderson, of Ellesmere, Dudley Road, Wimbledon; and Thomas G. Lamb, of Sells, Limited, Fleet Street. The registered office is at 100, Victoria Street, S.W. Mr. S. A. Curzon is a director of the London General Omnibus Supply, Limited, of 98-100, Victoria Street, S.W., in the registration particulars of which he was described as "concessionaire to the London General Omnibus Company, Limited." The Somerset House file number is 130,046.

Albion Tower Wagon.—The illustration below shows a tower wagon constructed by the Albion Motor Car Company, Limited, of Scotstoun, Glasgow, which has recently been supplied to the South

**Albion Motor Tower Wagon.**

Shields Corporation. The machine has an engine of 32 h.p., and is fitted with a patent clutch of the Albion Company's own design, which is specially constructed to ensure easy control. In cases of tower wagons, when men are working at the top, the latter point is of importance.

Searle Unburstable Inner Tube.—Mr. Frank Searle, late chief engineer of the London General Omnibus Company, and now of the Daimler Company, Coventry, is one of the directors of the Searle Unburstable Inner Tube Company, Limited, who on November 25-27, offered for public subscription 55,000 7 per cent. participating cumulative preference shares of £1 each. The total capital is £75,000, the company being formed to acquire the business and assets of Hall and Searle, Limited, and the patents for the tube. The use of the tube saves the necessity of discarding old outer covers. It has been tested by the Royal Automobile Club. A sale of 20,000 tubes is estimated during the first year, giving a net profit of £16,000, equal to a dividend of 12½ per cent. on the preference capital. The purchase price has been fixed by the vendors at £36,000, allocated to goodwill, shares, and cash,

## WEEKLY LIST OF TENDERS INVITED.

### CITY OF BELFAST.

TRAMWAYS DEPARTMENT.

TENDERS FOR THE SUPPLY OF TRAMWAY PASSENGER TICKETS.

The Tramways and Electricity Committee are prepared to receive tenders for the supply of Tramway Passenger Tickets for a term of three years, from January 1, 1914.

Specimens of the tickets required, and form of tender, may be obtained upon application to the General Manager, at the Tramway Office, Sandy Row, Belfast.

The estimated annual requirement is 70 millions.

The Committee do not bind themselves to accept the lowest or any tender.

Tenders, endorsed "Tenders for Tickets," are to be addressed to the undersigned, and must be received at the City Hall, Belfast, not later than 11 o'clock a.m. on Monday, December 22, 1913.

A tender, if sent by post, must be registered. If delivered by hand, an official receipt must be obtained for it. Otherwise, the undersigned will not be responsible.

R. MEYER,
Town Clerk.

City Hall, Belfast,
December 9, 1913.

### CITY OF CARLISLE.

ELECTRICITY DEPARTMENT.

INSTALLATION OF HIGH TENSION PLANT.

The Corporation of Carlisle invite tenders for the supply, delivery, and erection of the following plant:—

(1) Two 1,250 kw. High Pressure Turbo-Alternators ("Impulse" Type Turbines).
(2) Two Sets of Surface Condensing Plant for above Turbo-Alternators.
(3) Two 600 kw. Rotary Converters.
(4) High Tension Switchgear.

Specification, with general conditions and form of tender, may be obtained from the undersigned at the Electricity Offices, Victoria Viaduct, Carlisle, upon payment of a deposit of two guineas for each section, which will be returned after the tenders have been adjudicated upon, provided a *bonâ-fide* tender is sent in by the date specified and not withdrawn. Extra copies of each specification may be obtained at the sum of 5s. each, which is not returnable.

Tenders properly endorsed and sealed with wax to be sent to the undersigned not later than 9 a.m. on Wednesday, December 31, 1913.

The contracts are subject to the sanction of the Local Government Board, and the Corporation do not bind themselves to accept the lowest or any tender, nor will the Corporation pay any cost incurred in tendering.

FREDK. W. PURSE, M.I.E.E., M.I.Mech.E.,
City Electrical Engineer.

Electricity Offices, Victoria Viaduct, Carlisle,
December 10, 1913.

### CITY OF BRADFORD.

TRAMWAYS DEPARTMENT.

TENDERS FOR ELECTRIC TROLLEY VEHICLE EQUIPMENT.

The Bradford Corporation are prepared to receive tenders for the supply of Electric Trolley Vehicle Equipment, as follows:—

(a) 56 D.C. Series Traction Motors, 20 h.p., to specification.
(b) 28 Controllers, to specification.
(c) 28 Chassis, to drawings and specification.
(d) 30 Resistances, to specification.
(e) 60 Automatic Circuit Breakers, to specification
(f) 28 Junction Boxes, to drawings and specification.
(g) 60 Trolley Bases, to drawings and specification.

Schedules, with drawings and conditions of tender, may be had on application at the Tramways Offices, 7, Hall Ings, Bradford, on payment of the sum of five guineas, which will be refunded on the return of the tender form and drawings. Cheques to be made payable to the order of the Bradford Corporation.

The contract will be let subject to the Fair Contracts Clauses of the Corporation.

Tenders, endorsed "Electric Trolley Vehicle Equipment," to be sent to me not later than Saturday, the 3rd day of January, 1914.

The lowest or any tender will not necessarily be accepted.

FREDERICK STEVENS,
Town Clerk.

Town Hall, Bradford.

### COUNTY BOROUGH OF OLDHAM.

SUPPLY OF UNIFORMS.

The Tramways Committee are prepared to receive tenders for the supply and delivery of Uniforms for Tramway Employees.

Specification and conditions, with form of tender, and sample garments, may be seen on application to the Tramways General Manager, Wallshaw Street, Oldham.

Sealed tenders, endorsed "Tender for Uniforms," and addressed to the Chairman of the Tramways Committee, to be delivered at the General Manager's Office not later than Tuesday, January 13, 1914.

The Committee do not bind themselves to accept the lowest or any tender, and reserve the right to accept the whole or any portion of the tender.

Persons tendering must at the time of tendering, and at all times during the execution of the work, be paying all their workpeople not less than the standard rate of wages in the district where such workpeople are actually engaged in the execution of the work, and must be observing the hours and conditions of labour recognised by the associations of employers and the local organised body of workers in the various trades in such districts.

The contractor must also agree to comply with and conform to the provisions of the Trade Boards Act.

J. H. HALLSWORTH,
Town Clerk.

Town Hall, Oldham,
December 10, 1913.

### BOMBAY, BARODA, AND CENTRAL INDIA RAILWAY.

The Directors are prepared to receive up to noon on Tuesday, December 23, tenders for the supply of:—

Files.

Tenders must be made on forms, copies of which, with specification, can be obtained at these offices on payment of 10s. each (which will not be returned).

The Directors do not bind themselves to accept the lowest or any tender.

C. CROMMELIN,
Secretary.

Offices: Gloucester House,
110, Bishopsgate, London, E.C.,
December 11, 1913.

Digitized by Google

### COUNTY BOROUGH OF NORTHAMPTON.

CORPORATION ELECTRIC TRAMWAYS EXTENSIONS.

The Corporation invite tenders for the Construction of a Double Line of Tramways to Far Cotton and the Doubling of a Section of the Kingsthorpe Route, together with the necessary Overhead Equipment, Underground Feeders, Telephones, etc.

The equivalent length of single track is about 3 miles. Plans may be seen, general conditions, specifications, bills of quantities, and forms of tender obtained at the office of Mr. Alfred Fidler, M.Inst.C.E., Borough Engineer, Guildhall, Northampton, on and after Saturday, the 20th inst., on payment of a deposit of £5, which will be returned in full upon receipt of a *bonâ-fide* tender.

Sealed tenders, endorsed "Tramways Extensions," to be delivered to the undersigned not later than 12 o'clock noon, on Monday, the 12th day of January, 1914.

The lowest tender will not necessarily be accepted.

HERBERT HANKINSON,
Town Clerk.

Guildhall, Northampton,
December, 1913.

### URBAN DISTRICT COUNCIL OF WATERLOO-WITH-SEAFORTH

TENDERS FOR MOTOR FIRE ENGINE AND APPLIANCES.

The above Council invite tenders for a Motor Fire Engine with Petrol-Driven Pumps, together with Fire Appliances and Canvas Delivery Hose.

Specifications and full particulars may be obtained from Mr. F. Spencer Yates, Assoc.M.Inst.C.E., the Surveyor to the Council, at the Town Hall, Waterloo, near Liverpool.

Tenders, endorsed "Fire Engine and Appliances," or "Canvas Hose," as the case may be, and addressed to the undersigned, are to be delivered not later than the first post on Wednesday, the 24th December instant.

The Council do not bind themselves to accept the lowest or any tender.

By order, JOHN I. THOMPSON,
Clerk to the Council.

Town Hall, Waterloo, near Liverpool,
December 4, 1913.

## POSITIONS VACANT.

### ROYAL BURGH OF KIRKCALDY.

TRAMWAYS DEPARTMENT.

Wanted at once, an experienced Overhead Linesman. Apply, giving qualifications and references, to

O. F. FRANCIS,
The Electricity Works, Kirkcaldy.

### MECHANICAL DRAUGHTSMAN.

Wanted at once, first-class Mechanical Draughstman, one who understands tramway truck construction. Address at once, stating experience and salary wanted, Anger Manufacturing and Supply Company, Limited, Bank Chambers, Preston.

### DRAUGHTSMAN.

Wanted, smart Draughtsman for tramcar and motor-bus work. Applicants should state age, experience, and salary required to Falcon Works, Loughborough.

## LABOUR TROUBLE IN LEEDS.

The extensive strike which began on Thursday, affecting practically every branch of municipal activity in Leeds except the tramways, must give ground for serious thought to all those people who are in favour of municipalising every sort of local public service. The demand of the trade unionists is that all men who have not received an increase of pay of 2s. per week should at once receive it. The Town Council recently refused the demand, and the strike is the result. About 3,000 men are now "out," and many others are involuntarily deprived of employment for the time owing to dislocation of industry. The tramway men have not so far cast in their lot with the strikers, as they are working under an agreement which does not expire till February next; but there is a possibility of their taking part should "blackleg" labour be taken into any of the departments, and, indeed, they threaten to come out to-morrow. The electric stations are only slightly affected by the strike so far, but many men have left off at the gas works and the cleansing department is disorganised. Many suburban streets have been left in darkness at night. It appears that to grant the demand of the strikers would mean a substantial addition to the burden of the rates, and both Liberal and Conservative members of the Corporation are united in resisting the trade unions' request. The trouble is that there are no fewer than sixteen Labour and Socialist members of the City Council, and they appear to be in favour of any request put forward for increased wages, no matter what the cost to the citizens may be. It is gratifying to find that the chairmen of the Corporation Committees who employ labour are tackling the subject in earnest, and are making all preparations for continuing the work of the Committees, even on a restricted basis. Offers to work have been received from great numbers of men, and if both sides stand firm it will only be a question of time for all vacancies to be filled. A very great proportion of the labour concerned is practically unskilled or of a nature which requires only a short period of learning, so that no great difficulty need be anticipated on that score. The unfortunate thing in the case of strikes of men employed in public utility work is that the local authority or company concerned cannot well declare a lock-out when outrageous demands are made; the necessity for carrying on the service without interruption is so paramount that no means can be neglected for securing that object. Hence the work has to go on as best it can with such men as do not strike and with such additional assistance as may be obtainable. This is what is being done at Leeds. The case of railway companies is analogous, for the train services must if possible be maintained. The threatened strike of Post Office employees is another case in point. Though some of the Leeds gas workers have broken contracts by striking because a foreman slacked some coke, it may be hoped that the tramway employees will not follow the evil example. So far at least as the car drivers are concerned, theirs is a skilled form of work, and substitutes cannot be found on the spot. In any case, it is to be hoped that the majority of the Corporation will stand firm and will be backed up by the great majority of the citizens. The mass of the people are not to be terrorised by extortionate demands of a minority. Even though many of the strikers have votes, they should be resisted in such a case as this where demands are unreasonable. A firm policy is often easier in the case of a company than in that of a local authority, but the latter have shown in various towns from time to time that it can be firm, and the result has been all to the good. The effect of the uncompromising attitude taken up and maintained by the Postmaster General towards the employees who threatened to strike for a 15 per cent. advance of wages should have a heartening effect on the people of Leeds and on their municipality.

## PARCELS TRAFFIC AT CHRISTMAS.

During the next two weeks the cars at certain times of the afternoon and evening will often be found to contain in the lower saloon more parcels than passengers. After several hours spent in shopping expeditions the owners of the packages become fatigued, and on reaching the havens of refuge provided by the cars they are apt, in some cases, to be a little inconsiderate. At very slight provocation their tempers are ruffled. Yet a conductor is bound to do his best to secure the comfort of other passengers, and it is possible that the men may be assisted in their tasks, and the convenience of all their fares be promoted, if a suitable notice is affixed to the car windows. This notification might be worded to the effect that "Christmas shopping is wearying alike to buyers and sellers. Do your part to relieve the strain on yourself and others by concluding your shopping and returning home on an early car." Or the notice might be to this effect: "Christmas shoppers can be of great assistance to the car employees and at the same time avoid personal discomfort by returning home before the evening rush-hours." The Sheffield management, like other places where there is not a separately organised parcels service, have lately had to deal with an abuse of the parcels

Digitized by Google

regulations. Consequently orders were issued to the conductors to secure a more strict observance of the rules, as numerous complaints had been received of the platforms being loaded up with tradesmen's parcels, sometimes to the exclusion of passengers' luggage. Tradesmen have been asked to keep the size of their parcels within reasonable dimensions, as there have been several instances in which a mass of uncovered meat, too heavy for a boy to carry, had been brought by men to the car. Objection has also been raised to dripping fish and tripe. On account of conductors having in a few instances refused to carry persons bearing bulky personal belongings, the local newspapers have contained a flood of correspondence, which has necessitated the general manager seeking publicity for the true purpose of the instructions issued to the car crews. In reply he has received many suggestions that a charge should be made for parcels, and his answer is that the Corporation do not possess the statutory authority to adopt that course. The parcels systems in vogue at Manchester and Bradford have been specially pointed to as worthy of imitation, owners of parcels being able to purchase stamps to frank the conveyance of their loads without themselves using the car. It further appears that some years ago the Tramways Committee considered a proposal to institute a parcels system, but came to the conclusion that it was not a work for the municipality to take up.

## RAILLESS CAR ROUTES AT KEIGHLEY.

Keighley Council on December 9 adopted a recommendation by the Tramways Committee to enter into a contract with the Cedes Electric Traction, Limited, 112, Great Portland Street, London, W., for the supply and erection of overhead equipment on the Oakworth and Eastburn trolley vehicle routes at an inclusive price of £923 per mile, and for the supply of four trolley vehicles at £720 each. The approximate length of the Oakworth and Eastburn routes is six miles seven furlongs. The chairman of the Tramways Committee (Mr. Albert Smith), in moving the adoption of the recommendations, said that the system had been in operation on the Ingrow-Cross Roads route for seven months, and had proved very satisfactory. The company had lent the Corporation a vehicle on May 3, and the Corporation had been at no expense either in regard to the upkeep of tyres or any other part of the vehicle. The vehicle had run 9,194 miles and the receipts had been £433 19s. 5d., an average of 11.32d. per mile. There were three other systems of trackless cars in Yorkshire—at Leeds, Bradford, and Rotherham. The total cost per car mile in Bradford was 9.193d., and Rotherham was about the same. The Keighley motor omnibuses cost 1s. 4d. per car mile, and the revenue was 12.393d., so that there was a loss of at least 4d. per mile. The tramways manager estimated that the cost of the trackless car per mile, including interest on loans and sinking fund charges, would be 7.998d.; and as the revenue was 11.830d. per car mile they would be left with a substantial profit. The committee felt they would be able to get very near the estimated figure in regard to the cost, but even should the total expenses per car mile be as high as those in Bradford they would be left with well over a profit of 2½d. per car mile. In 1911-12 their omnibuses covered 121,205 miles, and calculated at even a penny profit per mile they would get a total profit of £500 for the trackless cars. On the experience of Leeds, Bradford, and Rotherham they should get at least a profit of 2d. per mile. Since the system was installed in the early part of the year the cost of labour and the price of material had increased, and the committee thought they had made a bargain in getting this new work done at the old price.

## WHEN P.A.Y.E. CARS ARE REQUIRED.

The question was raised at a meeting of Oldham Tramways Committee on December 5 of the stopping of cars by inside passengers when the conductor was on the top collecting fares. Councillor Calvert advocated the employment of trolley boys. The manager (Mr. Dugdale) said Manchester only had boys on the big cars carrying over seventy people. He would not have boys on the single truck cars. Councillor Elliot agreed with Councillor Calvert and referred to the number of fares missed on Saturdays. They did not collect the fares they were entitled to on the football cars. The Chairman: We ought to have the pay-as-you-enter cars for football traffic. Mr. Dugdale: There are people who set out to cheat us. Councillor Elliot: And they boast about it. Mr. Dugdale: They would do it if you had trolley boys. The matter was left with the manager.

## NEW AND PROSPECTIVE WORK.

CARLISLE.—Extensions of plant, etc., are to be made at the electricity works, at an estimated cost of £24,000.

BURY.—Extensions of 1,077 yards and a quarter of a mile are to be made to the tramway system.

NEWCASTLE-ON-TYNE.—By a unanimous vote the Corporation have decided to proceed with the Bill to authorise tramway extensions.

KEIGHLEY.—The Council have agreed to make application for sanction to borrow £16,100 for extensions to the plant at the electricity works to meet future demands for current.

GLASGOW.—On December 8 the Council approved of the provisions of a Provisional Order relating to tramway extensions and the erection of a bridge across the Clyde at Oswald Street, which will be available for tramways.

LEITH.—In connection with proposed extensions of the tramways, it is suggested that motor omnibuses might be first run to ascertain whether the amount of traffic would warrant the laying down of tramways. One route, it is stated, would only be a financial success if connected with the Edinburgh system.

BURNLEY.—Consideration is being given to a report submitted by the Tramways Committee for three extensions of the system to Abel Street, Stoneyholme, and Brunshaw. Although the committee had decided that a motor omnibus service to Stoneyholme would not be as cheap as a tramway, Councillor Lees said he would introduce a motion relating to such services later on.

GREAT YARMOUTH.—A great hindrance to tramway traffic is to be removed. At present the tramways are divided into two sections owing to the lines not running across the Hall Quay Bridge. On December 9 the Council adopted statutory resolutions approving the promotion of a Bill to authorise the Port and Haven Commissioners to construct a new bridge and approaches, and the Corporation to construct additional tramways and pay half the costs of the bridge. The bridge is estimated to cost £80,000, the tramway extension £6,500. Opportunity will be taken to pave the Hall Quay roadway with wood paving.

## L.C.C. TRAMWAY MATTERS.

COUPLERS FOR TRAILER CARS.

At last Tuesday's meeting of the London County Council the Highways Committee reported that in connection with the work of fitting couplers to ten standard cars for use with trailer cars, twenty coupler heads had been obtained from the A.B. Coupler, Limited, at a cost of £60. The Committee had also obtained from the firm one buffer head, six buffer head couplers for tractors, and three buffer head couplers for trailers required as spares at the price of 45s., 60s., and 45s. each respectively.

PAY OF FITTERS AND LABOURERS

A request had been made on behalf of the fitters employed at Greenwich generating station that their wages might be increased to the same extent as the increase agreed to recently for fitters employed at the central car repair depôt. That increase, the Committee recalled, was a halfpenny an hour and a further increase of a halfpenny an hour a year later. There were 17 fitters employed at the Greenwich station, and the Committee proposed that the matter should be referred to the Electrical Conciliation Board. Similarly it was recommended that an application by the fitters' labourers employed at the Greenwich station for an increase of pay from 6½d. to 7d. an hour should be referred to the same board. The rate included in the Council's list of wages and hours of labour for labourers in the engineering trades was 6d. an hour, and the Committee were of opinion that the request should not be agreed to, but they proposed the reference to the Conciliation Board as the men had made a request for it.

SUPPLY OF AXLE FORGINGS.

The following tenders had been received from selected firms for the supply of 100 axle forgings of 5¼ inch diameter:—

| | Price each. £ s. d. | Discount. |
|---|---|---|
| W. Beardmore and Co. | 2 0 6 | — |
| Cammell Laird and Co. | 2 1 9 | 2½ per cent. |
| Steel, Peech and Tozer | 2 3 3 | 2½ per cent. |
| Glasgow Railway Engineering Co. | 2 4 9 | — |
| John Baker and Co. | 2 6 6 | 2½ per cent. |
| John Brown and Co. | 2 8 9 | 2½ per cent. |
| Steel Company of Scotland | 2 12 6 | — |
| J. Batt and Co. | 2 14 6 | — |
| Brown Bayley's Steel Works | 2 15 0 | 2½ per cent. |
| Darlington Forge Co. | 3 2 6 | 2½ per cent. |
| W. Jessop and Sons (forgings only) | 19s. a cwt. | 2½ per cent. |

The lowest tender, that of William Beardmore and Co., Limited, was 20s. 7d. lower than that of Cammell Laird and Company, but the additional cost of inspection at the works of the former firm would considerably exceed this figure, and the Committee had therefore accepted the tender of Cammell Laird and Company, amounting to £203 10s. 7d. The estimate of the chief officer was £210.

PROSPECTIVE CONTRACTS.

In connection with the extension of the central car repair depôt it had become necessary to provide additional control gear and recording apparatus for use in the dynamo-metric testing of car motors, and the Committee recommended that tenders for the provision of these should be invited from selected firms. The Committee also advised that certain feeder pillar panels, switches, etc., were required, and that tenders should be obtained from selected firms.

The various reports were adopted.

Digitized by Google

PENNY FARES.

Mr. J. D. Gilbert asked if the Highways Committee would consider the question of penny return fares.

Mr. Hume replied that the Committee were doing so, and would report in due course.

Mr. C. Jesson asked if the Highways Committee would report on the feasibility of a universal penny fare in London for the information of the public.

Mr. Hume replied that the revision of the fare stages were being considered, but a universal penny fare had not been dealt with. If the hon. member realised that the Highways Committee were doing their best to deal with competition he appealed to him not to press on them too strongly new points, because they must have time to see the effect of the alterations already made.

## MISCELLANEOUS NEWS AND NOTES.

**Side Guards.**—Experiments are to be made with a side guard on the Warrington Council's cars.

**Increased Speed at Bexley.**—The Board of Trade have been asked to approve of certain increases of speed on Bexley Council tramways now that new trucks, fitted with electro-mechanical brakes, have been adopted.

**Railless Cars for Morley.**—The construction of the railless trolley equipment from Morley to Leeds railless terminus at Farnley is expected to be undertaken at an early date. Leeds Council will supply the cars and work the system.

**Nottingham Tramways Joined with the County System.**—The Notts and Derby Tramways Company have extended their line from Cinderhill to the junction with the Nottingham Corporation Tramways at Church Street, Basford. Through service will be inaugurated early in next year.

**Facilities for Passengers at Darwen.**—It has been decided by the Tramways Committee in the cases of old people and cripples the cars shall pick up and set down at the nearest places to their homes, and not necessarily at the fixed halts. On Sundays stops will be made opposite the various churches.

**Railless Cars and Omnibuses for Aberdeen.**—The Law Committee of Aberdeen Council have adjusted the clauses in the new Provisional Order which is to be applied for. The powers asked for include the provision and running of railless trolley cars on three routes and motor omnibuses on three routes.

**Reconstruction of Roads for Motor Traffic.**—Essex County Council have agreed to spend £26,457 on paving various main roads in the Walthamstow district, Hoe Street and the Chingford Road costing between them £15,012. The work has been rendered necessary by motor omnibus and other heavy mechanical traction.

**Wolverhampton to Purchase Four Omnibuses.**—Upper Penn and Compton, the two principal outlying districts not yet served with adequate means of transit to the centre of the borough, are to be provided with motor omnibus services. The Corporation have decided to purchase four vehicles at an estimated cost of £2,744.

**Fare Questions at Salford.**—Proposals submitted by the Tramways Committee for reduced fares have been sent to the General Purposes Committee for consideration. Alderman Linsley, chairman of the Tramways Committee, said the committee were against halfpenny fares. The penny fare was the backbone of the undertaking.

**Doubling of Routes at Wallasey.**—Owing to the delay caused to the cars by single line tracks with loops on several important routes, the Tramways Committee have adopted a scheme for doubling the lines, and the work on the Seabank Road section is in progress. A sum of £10,000 is to be expended on an extension of the workshops.

**Availability of Workmen's Tickets.**—After considering an application that workpeople who were working overtime should be allowed to use their return tickets after the period during which they were available, the Bury Tramways Committee have decided that no alteration be made with regard to the holders of penny tickets, but with respect to 1½d., 2d., and 2½d. tickets these will be made available for return any time during the day of issue.

**Favourable Outlook at Newport.**—As the result of the increased fares and the efforts made to cultivate traffic, the receipts of the Corporation tramways for the past seven months show an increase of £2,085. Traffic is to be started at 9 a.m. on Christmas Day in order to cater for the traffic at a special football match, which when played at Cardiff last year drew an attendance of 25,000. Football traffic is responsible for a good portion of the increase in the receipts this year. On Christmas Day the employees will choose morning or afternoon turns of duty.

**Scottish Tramway Companies Combine to Meet Motor Competition.**—The newly-formed Scottish General Transport Company proposes to amalgamate the interests of the Greenock and Port Glasgow, Airdrie and Coatbridge, and Rothesay Tramway Companies with a view to preparations for future developments. The Greenock and Port Glasgow paid 6 per cent. to the ordinary shareholders for the year ended December, 1912. The Airdrie and Coatbridge Company paid 5 per cent. last year. The Rothesay undertaking have not yet paid anything on ordinary shares. Of late years the companies have had to meet competition by motor omnibuses, and the Greenock Company have established an omnibus service of its own.

**Effect of a Time Table on Receipts.**—Report was made to Oldham Tramways Committee that the receipts for the fortnight ended November 30 had increased by £300 over the corresponding period last year. Complaint was made by a member that sufficient time was not allowed to the motormen in congested streets, but the manager gave figures showing that 90 minutes were allowed for a 10-mile run, 70 minutes for 9 miles, 75 minutes for 6½ miles, 80 to 90 minutes for 9½ miles, and 70 to 75 minutes for 8¼ miles. Now that they had a time table the receipts were increasing, and they were getting traffic which they did not obtain before. At the request of the manager it was decided to write to the police concerning motor vehicles breaking down on the track. The Town Clerk stated that on a highway the by-law said that slow-moving vehicles must keep on the right side. Alderman Greaves said in Manchester the lorries were compelled to keep on the proper side of the track.

**The Hatpin Danger.**—While the London County Council tramcars on December 10 contained a notice directing attention to the danger of the unprotected points of women's hatpins, the Prefect of the Paris Police issued a notification forbidding the wearing of the pins, unless covered by a protector, in the stations and carriages of the Underground and other railways within the limits of Paris, in tramcars, omnibuses, or public vehicles of any description, in theatres and places where exhibitions are held, and in all public spaces where at any time persons may be in throngs or move in close contact.

**Omnibuses Introduced at Oxford.**—The recently-formed Oxford Motor Omnibus Company on December 5 started a service of motor vehicles. Application had been made in November for licences, and it is stated that owing to a misunderstanding the matter was not brought before the Watch Committee. Passengers obtain tickets from shopkeepers who are acting as agents. In other towns where unlicensed vehicles run the conveyances pick up and set down the passengers on private property. A town's meeting held on December 10 passed a resolution urging that licences should be granted to omnibuses on equitable terms. The Parliamentary Committee of the Council met on the same day and recommended that an injunction should be applied for to stop the running of the omnibuses. This will be considered at a special meeting of the Council next week.

**Tramcar Controllers.**—In a communication to the Tramways Associations the Board of Trade state that their attention "has been called to a source of danger which may arise in tramcar controllers. In the case of a recent accident, caused by a car getting out of control on a falling gradient, it was subsequently discovered that the insulation of one of the controller leads had become chafed in such a way that if contact took place with an adjacent (No. 3) terminal at the bottom of the controller, a short circuit across both armatures would be created, and the magnetic brake would thereby be rendered inoperative. The ordinary tests made before the car was put into service failed to detect any such short circuit, but it was subsequently proved by trial on the ground that, owing to vibration or some other cause, contact did take place, with the result that a short-circuit of the nature mentioned above was established." The Board ask that the question may be considered whether special precautions should not be taken to preserve the insulation of controller leads at points where its failure might lead to dangers of the kind indicated above.

**Leeds Tramwaymen and the Strike of Municipal Employees.**—On Thursday 3,000 workmen employed by the Corporation left work, against the advice of their leaders, in an effort to secure an immediate advance of 2s. a week all round. The tramwaymen are not directly affected in the dispute, for, under agreement, they are bound not to advance new claims to consideration until February. Their union, however, which is affiliated to the Federal Council, has promised moral support in the present dispute. The local secretary of the tramwaymen's union has stated that as soon as the first "blackleg" was brought into the tramways department to take the place of any man who had come out, the union would take a ballot as to whether their members would be prepared to cease work. The paviors went out on strike, and when about 120 men employed in the permanent way department of the tramways—men who are members of the Tramwaymen's Union—found they could not commence in the absence of the paviors, they described the position as a "lock-out." The men at the Whitehall Road electric lighting station have given a week's notice, and a similar action has been taken at the tramways power station at Crown Point. Yesterday a ballot was taken of the tramway union men on the question mentioned above, and the result was to be declared at midnight.

**Cedes Trackless Trolley Cars at Keighley.**—In the annual report of Keighley Corporation tramways, Mr. H. Webber, the electrical engineer and tramways manager, refers to the introduction of the Cedes-Stoll railless trolley cars in substitution for the petrol omnibus. He observes that, with the practical experience gained, the committee will not require much argument to prove that the new type of vehicle will not only give a regular service but comfort for the passenger. Mr. Webber adds that it would appear to be wise not to delay very much longer before starting the electrification of the other routes on which the motor omnibuses are at present in use. The power cost of the trolley vehicles is ascertained by a meter fixed at the commencement of the new overhead equipment, so that it takes in all line losses as well as the actual current consumption. The average obtained is 50 units for 56 miles run, or about .9 of a unit per mile. The charge for electricity is 1d. per unit. The total expenses per car mile is given as approximately 7d., whereas the estimate for the motor omnibuses is 1s. 3d. As the revenue on the omnibus routes averages 11d. per 'bus mile, Mr. Webber predicts a great success for the trolley vehicle, but warns the committee against increasing capital expenditure more than is absolutely necessary. An illustrated

Digitized by Google

article by Mr. Webber, describing the working of the Keighley installation, appeared in THE TRAMWAY AND RAILWAY WORLD of October 16.

**Litigation Concerning Traction Current.**—In the Chancery Court on December 10, Mr. Justice Sargant heard the action of the Sunderland District Electric Tramways *v.* the Newcastle-upon-Tyne Electric Supply Company and the County of Durham Electric Power Supply Company, Limited, which related to the supply by the defendants of electric power for the running of the plaintiffs' tramway. Mr. Romer, K.C., for plaintiffs, said the relief asked for was a declaration that plaintiffs were entitled to the continuance of a supply of electric energy in the terms of an agreement, dated January 30, 1905, and for an injunction to restrain defendants from cutting off or discontinuing the supply. The point was whether under the circumstances the agreement was binding upon defendants, it not having been made with them, but with the Durham Collieries Electric Power Company. That company, from whom plaintiffs originally took the supply of electricity for running their cars, went into liquidation, and sold their assets to the first-named defendants. The County of Durham Electric Power Supply Company merely came in because it seemed the first defendants took some of the energy supplied from them, and it was from them that the first threat to cut off the supply came. It was announced later that terms, which were not mentioned, had been agreed to between the parties; and his Lordship made an order staying proceedings in the action on these terms.

## CONTRACTS AND ORDERS.

**Babcock and Wilcox, Limited,** have received a contract to supply two mechanical stokers to East Ham Council, at £534

**St. Helens Council** have allotted a contract for the supply of cable to Callender's Cable and Construction Company, Limited.

**The Lorain Steel Company** have secured the contract for special trackwork, amounting to about £42,000, for the St. Petersburg tramways.

**Keighley Council** have adopted the tender of the British Thomson-Houston Company, Limited, for supplying a spare motor, at £500.

**Siemens Bros. Dynamo Works, Limited,** have obtained contracts for the supply of Tantalum and Wotan lamps to the Metropolitan Railway Company.

**Sheffield Council** have placed an order with the Brightside Foundry Company, Limited, for installing hot-water apparatus at Holme Lane car depôt, at £73.

**Walsall Council** have given a contract to G. Robson and Co. for a combined electric track grinder and drilling machine, and to the General Electric Company, Limited, for sub-station gear, at £41 10s.

**Wolverhampton Council** have accepted the following tenders:—Willans and Robinson, Limited, 4,000 kw. turbo-alternator with condenser, and steam and water pipes, £13,159, and A. Reyrolle and Co., Limited, switchgear for the extension plant, £650.

**Mr. John Taylor,** of 7, Strand Street, Liverpool, has recently received the following orders for his patent tubular sand controllers:—Doncaster Corporation, 100; Sheffield Corporation, 122; West Ham Corporation, 192; Manchester Corporation, 60; Blackpool Corporation, 28; and Newport (Monmouth), Corporation, 12.

**Manchester Corporation** have placed contracts as follow:—1,800/2,200 kw. converter for Dickinson Street sub station, Bruce Peebles and Co., Limited; supply of 12 months' requirements of static transformers, Ferranti, Limited; cable, W. T. Glover and Co., Limited, Liverpool Electric Cable Company, Limited, Charles Macintosh and Co., Limited, and Johnson and Phillips, Limited.

**London County Council** have accepted the following tenders:—Cammell Laird and Company, 18 tons of special hard rolled steel, £184 10s.; British Westinghouse Company, 16 armatures (class 220), and 80 field coils of the same type, £38 18s. per armature and £6 per coil; A. B. Coupler, Limited, 20 coupler heads, £60, one buffer head, six buffer head couplers for tractors, and three buffer head couplers for trailers, 45s., 60s., and 45s. each respectively; A. and F. Manuelle, 8,300 tons of Guernsey granite setts required over a period of twelve months and delivered at various wharves and depôts, £13,858; Cammell Laird and Company, 100 axle forgings of 5¼ inches diameter, £2 1s. 9d. each, less 2½ per cent. discount, £203 10s. 7d.

## PERSONAL.

**Mr. G. F. Taylor,** electrical engineer and manager of Nelson Corporation tramways, has had his salary raised from £180 to £200.

**Mr. G. White** has been appointed rush traffic ticket inspector by the Mexborough and Swinton Tramway Company, after seven years' service as a motorman. He was formerly at Wakefield.

**Mr. W. Yorath Lewis** has been awarded the Society of Engineers' premium for his paper on "The Omnibus *v.* Tramway Controversy, and other Aspects of the London Traffic Problem," which was read at the meeting of the Society on February 3, and was referred to in our issue of February 8.

**Mr. L. C. F. Bellamy,** manager and electrical engineer, Ilkeston Corporation tramways, has reported that the traffic receipts during Fair week amounted to a record sum, and after consulting the chairman and deputy-chairman he had granted a bonus to each driver and conductor in recognition of their care in avoiding accident or missed fares. The committee approved this action.

**Glasgow Salaries.**—A special sub-committee of the Glasgow Corporation Tramways Committee recommend that the minimum and maximum salaries of the head of the department and principal assistants should be—General manager, £1,000, rising to £1,400 per annum, the annual increment being £50; present salary £1,100. Traffic manager, chief engineer, electrical engineer, and secretary and treasurer, £400 each, rising to £700 each, the annual increment being £25 each. The salaries of these assistants at present range from £625 to £425.

**Mr. Andrew Nance,** general manager, Belfast Corporation tramways, owing to indisposition which confined him to bed, was absent from the Tramway Committee's meeting on December 8. He, however, forwarded a report giving the information asked for as to the departments responsible in other municipalities for the repair and maintenance of the track. The consideration of this was held over until the end of the present financial year. Mr. Nance also submitted a report in reference to suggestions made by the Police Committee with regard to the congestion of traffic at Castle Junction, and this was forwarded to the Police Committee.

**Mr. W. T. Young,** on leaving Oldham Corporation tramways to take the position of traffic superintendent to West Ham Corporation tramways, has been presented with a gold albert and a gold pendant for Mrs. Young by the staff and employees. Mr. Dugdale, the manager, in making the presentation, observed that the recipient had risen from the bottom position in tramway work at Aberdeen, and in his new place he would have to contend with omnibus competition. In his reply, Mr. Young said he had tried to follow the motto of their Brotherhood, "Do unto others as you would that they should do unto you." If they did that there would be little trouble. He wished Mr. Dugdale a speedy recovery to health.

**The Rev. L. Blackburne,** president of the Portsmouth branch of the Tramway Brotherhood, was the preacher at St. Mark's Church on the occasion of a parade of the tramwaymen and police. The Mayor (Alderman Corke), chairman of the Tramways Committee, the members of the Corporation, and the officers of the two departments were also present. The preacher asked his hearers to remember that there was a Christian and an unchristian way of doing duty, and he reminded them that if they would seek to live up to the higher ideal in their daily lives, they would rise still higher in the opinion of the public. In proportion as they put themselves on one side, and thought not of their own good, but of the good of the whole, so would their service become truly efficient.

**Mr. Hopper,** chief assistant engineer and deputy manager to the Rhondda Tramways Company, has resigned that appointment in order to take up the duties of engineer and manager to an electric supply undertaking which the National Electric Construction Company are providing at Wisbech. In recognition of his six years' service at Rhondda he has been entertained at a farewell assembly by the staff and employees. Mr. H. J. Nisbett, the resident engineer and manager, who presided, said that whilst wishing Mr. Hopper success in his new undertaking, he felt that he was losing a valuable assistant. Mr. Hopper and himself had worked together for ten years, as they spent five years together at Sheerness before coming to Rhondda. In replying to the speeches Mr. Hopper said that the Rhondda Valleys were not the most ideal places for a tramway undertaking, what with floods, fogs, landslides and subsidences, to say nothing of narrow streets, level crossings, etc. The Porth Hospital Carnival Committee, of which body he has been a member, presented him with a gold-mounted walking stick.

**From Cleaner to Traffic Superintendent.**—In announcing at a presentation to the departing traffic superintendent at Oldham, that Mr. J. Brierley had been appointed to fill the vacancy on a twelve months' trial, Mr. Dugdale, the manager, said Mr. Brierley had worked up from the lowest rung of the ladder, and he thought he was worthy to be recommended for promotion. Mr. Dugdale strongly urged the young men to do all they could to improve their education and fit themselves for promotion. Two more men would shortly be promoted as motor inspectors and they would have higher rank than the ticket inspector. He thought they had two men in their shops fit for the work. Mr. Brierley began his career as a car cleaner on the Oldham steam tramways, and for a portion of his four and a half years' service in the steam traction era he also worked as a driver. When the electrification was effected in 1900 he became a motorman, and subsequently he entered the repair shop. After rising to be deputy shed foreman, he was appointed inspector six years ago, and in 1911 he became chief inspector.

**Mr. C. G. Tegetmeier,** chairman of the Swansea Improvements and Tramways Company, and Mr. S. E. Garcke, a director, attended the annual dinner of the employees. Mr. David James, the general manager, presided, and in proposing the toast of the company, said that the chairman joined the board the year following the opening of the electric system. From that time the company had been making steady, but continuous progress, and the shareholders saw some returns. A great deal of leeway would have to be made before adequate returns were given for the capital that remained idle. Mr. Tegetmeier was a man of great business capacity, and he had the utmost sympathy for his employees. Any suggestion or applications from them were always received in a sympathetic manner, and the directors had been very considerate in looking after the interests of the employees. Mr. James thanked the men for their help in the past, and assured them the success of the company was also that of the men's. Mr. Tegetmeier, in reply, remarked that on a previous occasion Mr.

Digitized by Google

James stated that no service could be truly efficient unless it was a contented service, and he thought he could rightly assume that they were contented. In those days of industrial warfare it was pleasing to dwell upon their amicable relations. Mr. James had put in 33 years' service. Mr. Tegetmeier also referred to such old stalwarts of the company as George Mitchell (with 36 years' service), W. James (32 years), N. Davies (33 years), and David Atkins (36 years). Mr. James was a friend of all of them, and treated him (the speaker) just the same as he treated the men. Mr. James still preserved the energy and enthusiasm that distinguished him when he entered the service. The Mayor (Alderman Corker) referred to the splendid manner in which the tramwaymen turned out at the church parade on a recent Sunday, to the amicable relations between Mr. James and his men, and also to the great improvements in the town, particularly Castle Street.

## FINANCIAL REPORTS AND MEETINGS.

**Scottish Motor Traction Company.**—The directors recommend a dividend of 7½ per cent. (free of tax) for the year. A similar dividend was paid last year.

**Record Receipts at Sunderland.**—The traffic receipts up to the present are over £5,000 in advance of those for the corresponding period last year, and £800 better than the takings in any previous year for a similar period.

**New Central Omnibus Company.**—At a meeting of this London and Bedford Company on December 8, the chairman (Mr. J. O'Connor, M.P.) said that there was now accruing on the income bonds to be handed over to the company on the completion of the "deal" recently entered into with the Underground Electric Railways Company a sum which would enable the board to declare a dividend, free of tax, of at least 12 per cent., apart altogether from any dividend that might be declared on their holding of Underground A shares next February. It was decided to defer until next February the calling of the winding-up meeting.

**The British Electrical Federation.**—The traffic statement for the week ended December 6, 1913, shows that the receipts from tramways and railways amounted to £33,165, as compared with £35,513 in the corresponding week last year, and from omnibuses £11,842, as compared with £1,322, making a total of £45,007, as compared with £36,835. The tramway and railway route mileage was 429.82, as compared with 428.47. Upon such of the services as were working both last year and this year, the receipts show a decrease of £2,108 upon the week. The Auckland tramways (25 miles) were not working during this week, owing to labour disturbance in the town. The receipts for the corresponding period last year on the Auckland tramways were £4 767.

**New South Wales Railways and Tramways.**—The report of the Chief Commissioner for Railways and Tramways for the quarter ended September 30 shows that there was an increase in the tramway earnings of £28,573, and an increase in expenditure of £40,898, over the corresponding quarter of last year. The number of passengers carried increased by 4,260,260, and 570,730 additional miles were run. Further particulars with reference to the tramways are appended :—

| Tramways. | Three months Sept. 30, 1913. | Three months Sept. 30, 1912. | Inc. | Dec. |
|---|---|---|---|---|
| Miles open | 208½ | 202 | 6½ | — |
| Revenue | £430,012 | £401,439 | £28,573 | — |
| Expenditure | £386,880 | £345,982 | £40,898 | — |
| Tram miles run | 7,012,716 | 6,441,986 | 570,730 | — |
| Earnings per car mile | 1s. 2.d. | 1s. 3d. | — | 1d. |
| Expenditure per car mile | 1s. 1¼d. | 1s. 1d. | ¼d. | — |
| Percentage—expenditure to earnings | 89.97 | 86.19 | 3.78 | — |
| Number of passengers carried | 72,592,137 | 58,331,877 | 4,260,260 | — |

**Bradford Half-Yearly Accounts.**—The statement of accounts for the half-year, ended September 30, presented to the Tramways Committee on December 1, showed a profit of £21,178, as compared with £25,907 for the corresponding period of last year. The traffic income was increased by £9,001 and represents 11.7d. per car mile, against 11.3d. Traffic expenses showed a growth of £3,300, repairs and maintenance of permanent way £2,300, and maintenance of cars £5,400. The trading profit is £18 490 or £5,850 less than in the corresponding six months, but as the interest and sinking fund charges are reduced by about £1,000, the net result is £4,818 decreased profit. The railless system showed a deficit for the half-year of £105, as compared with £180 a year ago. The profit on the parcels department was £425, an improvement of about £109.

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 60 of the principal undertakings of the United Kingdom for the week ended December 6 amounted to £223,300, or £17,480 more than in the corresponding week last year, while the track mileage was 2,862, or 80 more than for the corresponding week. The receipts were at the rate of £78 0s. 11d. per track mile, an increase of £4 0s. 10d. per mile as compared with last year.

## COPPER AND ALUMINIUM MARKET.

December 12, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton :—

| | Friday, December 12. | Last week. | A Year Ago. |
|---|---|---|---|
| | £ s. d. | £ s. d. | £ s. d. |

**All Communications and Advertisements for next week's issue should be received not later than 3 p.m. on Tuesday.**

**The Editorial and Publishing Offices of "The Tramway and Railway World" are at Amberley House, Norfolk Street, London, W.C.**

**Telegrams: "TRAMIGRO, LONDON."**

**Telephone: No. 2948 GERRARD.**

# WEEKLY LIST OF TENDERS INVITED.

## COUNTY OF LONDON.

The London County Council invites tenders for the supply of six 5-ton Steam Commercial Motor Wagons fitted with jib cranes, and two 2-ton Petrol Motor Wagons.

Persons desiring to submit tenders can obtain the plans, specifications, form of tender, etc., on application to the Clerk of the London County Council, County Hall, Spring Gardens, S.W., upon payment to the Cashier of the Council of the sum of £1. This amount will be returnable only if the tenderer shall have sent in a *bonâ-fide* tender, and shall not have withdrawn the same. Particulars of the work may be obtained on personal application, and the specifications and other contract documents may be inspected at the County Hall before the payment of the fee.

The contractor will be bound to pay all workmen employed by him in and about the execution of the contract, or any part thereof, wages at rates not less, and to observe hours of labour not greater, than the rates and hours set out in the Council's list, and such rates of wages and hours of labour will be inserted in and form part of the contract by way of schedule. Particulars of the Council's Standing Orders on these matters are given in the *London County Council Gazette*.

Tenders must be upon the official forms, and the instructions therein must be strictly complied with.

No tender received after 11 a.m. on Tuesday, February 3, 1914, will be considered.

The Council does not bind itself to accept the lowest or any tender, and it will not accept the tender of any person or firm who has withdrawn a tender after the same has been opened, unless the reasons for the withdrawal were satisfactory to the Council.

LAURENCE GOMME,
Clerk of the London County Council.

County Hall, Spring Gardens, S.W.,
December 17, 1913.

## COUNTY BOROUGH OF WIGAN.

The Electricity Committee of the Wigan Corporation invite tenders for the following:—

1. Supply, laying and jointing of High Tension, 3-Core Paper and Lead-Covered, Armoured Feeder Cable.
2. Transformer and Switchgear.

Copies of specification, with form of tender, etc., may be obtained on application to Mr. James Slevin, Borough Electrical Engineer, Bradford Place, Wigan, on payment of £1 1s. for each specification, which sum will be returned on receipt of a *bonâ-fide* tender.

Plans can be seen at the Borough Electrical Engineer's office.

Sealed tenders, endorsed "Cable" or "Switchgear" (as the case may be), to be delivered to the undersigned on or before Monday, the 29th instant.

The Committee do not bind themselves to accept the lowest or any tender.

WILLIAM HENRY TYRER,
Town Clerk.

Town Clerk's Office, Wigan,
December 10, 1913.

## COUNTY BOROUGH OF WEST HAM.

TRAMWAY TICKETS.

The Council hereby invite tenders for the supply of Tramway Tickets.

Specification and form of tender may be obtained at the Office of Mr. J. S. D. Moffet, Tramways Manager, Greengate Street, Plaistow, London, E., upon payment of £1, which will be returned upon receipt of a *bonâ-fide* tender.

Note.—No tender will be considered unless the same is delivered at the Office of the Town Clerk, Town Hall, West Ham, E., in the envelope supplied, by Registered Post, not later than 12 o'clock noon on Tuesday, January 6, 1914.

The Council do not bind themselves to accept the lowest or any tender. The contractor will be required to enter into a bond, with one surety, for the due performance of the contract.

The contractor whose tender is accepted, and with whom a contract is entered into, will be required to pay to the whole of his workmen such rate of wages, and observe such hours of labour as are recognised by the Workmen's Trades Unions, and shall not assign, nor underlet, or make a sub-contract with any person or persons for the execution of any part of such work. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

By order of the Council,

H. W. GREAVES,
Town Clerk.

Town Hall, West Ham, E.,
December 19, 1913.

## CORPORATION OF EDINBURGH.

TO MOTOR OMNIBUS BUILDERS.

TENDERS FOR MOTOR OMNIBUSES.

The Magistrates and Council are prepared to receive tenders for the supply and delivery of Motor Omnibuses not exceeding six.

General description, specification, conditions of contract, sketch drawings, and forms of tender, together with any other information, may be obtained from Mr. A. Horsburgh Campbell, M.Inst.C.E., Engineer, Parliament Square, on payment by crossed cheque of £2 2s. deposit, which will be returned on the receipt of a *bonâ-fide* tender.

Sealed tenders, endorsed "Tender Motor Omnibuses," and addressed to the undersigned, to be delivered not later than 10 a.m. on Wednesday, January 7, 1914.

The Magistrates and Council do not bind themselves to accept the lowest or any tender.

THOMAS HUNTER, W.S.,
Town Clerk.

City Chambers, Edinburgh,
December 17, 1913.

## CITY AND COUNTY OF THE CITY OF CHESTER.

TO ADVERTISING AGENTS AND OTHERS.

Notice is hereby given that the Corporation of Chester are prepared to receive tenders for the exclusive right to use the Corporation Tramcars for advertising purposes, for a period of five years. The conditions and form of tender, and all other information, may be obtained on application to the Manager of the Corporation Tramways, at the Tramways Depôt, City Road, Chester.

Tenders (in sealed envelopes) must be sent to the Town Hall, Chester, on or before the 7th day of January, 1914, addressed to "The Chairman of the Tramways Committee," and endorsed "Advertising Tender."

The Corporation do not bind themselves to accept the highest or any tender.

J. H. DICKSON,
Town Clerk.

Town Hall, Chester,
December 17, 1913.

### COUNTY BOROUGH OF SWANSEA.

ELECTRICITY DEPARTMENT.

The Corporation of Swansea invite tenders for one or two years' supply and delivery of :--

(*a*) Motors.
(*b*) Starting Switches.

Copies of the general conditions, specifications and forms of tender can be obtained on and after Tuesday next, the 23rd instant, from Mr. C. A. L. Prusmann, Borough Electrical Engineer, on payment of one guinea for each specification, which amount will be returned on receipt of a *bonâ-fide* tender. Additional copies of the specification can be obtained at 5s. per copy, which amount will not be returned.

Sealed tenders, endorsed "Motors," or/and "Starting Switches," to be delivered at my offices not later than noon on Thursday, January 8, 1914.

The Corporation do not bind themselves to accept the lowest or any tender.

H. LANG COATH,
Town Clerk.

Guildhall, Swansea.

### COUNTY BOROUGH OF WARRINGTON.

ELECTRICITY DEPARTMENT.

The Electricity and Tramways Committee of the County Borough of Warrington invite tenders for Weldless Steel Pipes for feeding Boilers.

Specification and form of tender can be obtained from the undersigned on payment of one guinea, which will be returned on receipt of a *bonâ-fide* tender. Five shillings will be charged for extra copies of specification.

Tenders, addressed to the Chairman of the Electricity and Tramways Committee, Town Hall, Warrington, must be sealed with wax and endorsed "Tender for Steel Pipes," and delivered not later than 12 o'clock noon on Wednesday, January 7, 1914.

The lowest or any tender will not necessarily be accepted.

F. V. L. MATHIAS, M.I.E.E.,
Borough Electrical and Tramways Engineer.

Howley, Warrington.

### COUNTY BOROUGH OF SALFORD.

CABLE CONDUITS.

Tenders required for 4,000 yards Doulton Pattern Three-way Brown Glazed Stoneware Cable Conduits.

Specifications may be obtained from the Borough Electrical Engineer, Electricity Works, Frederick Road, Salford.

## LESSONS OF THE LEEDS STRIKE.

Before dealing from the tramway point of view with some of the truths that should be taken to heart by all tramway authorities as the outcome of the Syndicalist strike at Leeds, we may be permitted to congratulate the City Council upon the firmness which they have displayed. It was that attitude alone that enabled the citizens to triumph over the conspiracy, and the slightest display of weakness would have been an encouragement to lawless agitators to attempt to involve other towns in similar trouble. The firm stand of the Corporation found a response in the formation of the Citizens' League, under whose auspices volunteers were forthcoming for the gas works and a power station, for the lighting of the lamps and for street scavenging. Rulers of other towns may be quite certain that Syndicalists will not be less active in their propaganda by the defeat at Leeds, and an effort should therefore be made in time of peace to organise the forces of law and order. The Leeds strikers recognised on Wednesday that the active participation of the citizens in the encounter meant speedy defeat, and a deputation from the Trades Council (which henceforth should be a suspected body) had the audacity to request the University authorities to prevent the students from giving their labour as stokers. The fact must also be recognised that Syndicalism would have no following unless there are men who seek notoriety and personal gain by acting as leaders. For tramway authorities there are several matters of interest emanating from the struggle. One is the question of the attitude of Tramways Committees to the so-called national executive of the Tramway and Vehicle Workers' Union. The withdrawal of the Leeds tramwaymen was in opposition to the rules. This is not the first occasion that men connected with the union have shown similar lawlessness, and the committees would be justified in considering whether they will have further dealings with a general secretary whose chief work seems to consist of being called in as advocate for the men who have struck. Thanks to the fixity of purpose of the Leeds Corporation, there will be no risk of outside interference there. But another point of equal, if not greater, importance arises, and that is the presence of a paid local secretary of the tramwaymen as a member of the Tramways Committee. This has, we believe, been the case in Leeds, and there is at least one other town in which a similar state of affairs exists. The local secretary has been the leader of the men in the encounter, which had for its object the infliction of any amount of damage upon the citizens and their property, in support of a demand for an increase of two shillings in wages all round. It is not wise policy for a representative of employees to be permitted to take part in the management of a department from which the men receive their wages. Perhaps the greatest offence of the tramwaymen was the deception which they practised. They had bound themselves to observe their present conditions of employment until next July. It is therefore plain that union men are not to be trusted. A statement appearing in another column shows that the question of imported labour at the power station was only a subterfuge. It had no weight with the citizens, who are entitled to defend their own property by either voluntary or paid labour. One satisfactory outcome of the strike is that the street paving department is to cease to exist, the work to be done in future by contractors. If the union men have the hardihood to apply for concessions when their agreement expires, it is to be hoped that they will be reminded of the loss they have inflicted this week upon the ratepayers and others.

## TRAMWAYS AS PERAMBULATING SWEET SHOPS.

The tramway policy of the London County Council has sometimes been criticised as lacking in originality and initiative. That charge has now been repelled once for all. The Council has given its colleagues in tramway management a lead such as few will even attempt to follow. Its enterprise will not only fill its cars with an aroma refreshing to its patrons, but it will carry the fame of the Council to the uttermost parts of the world. Automatic chocolate supply boxes are to be fixed in the upper saloons of double-deck covered cars. While the Council will allow the actual arrangements to be carried out by a contractor, it has been arranged that the job shall be thoroughly done. There must be no stint. Ten boxes—no less—are to be placed in each car, and the contractor must keep them filled, and what is more, he must collect the money from them. It is recognised that not even a "pay-as-you-eat" system would enable the conductor to attend to this business in addition to his other duties. Payment must be made, therefore, before the delivery of the chocolate. If there is no delivery after payment, then the passenger must see the contractor. All details, it will thus be seen, have been carefully worked out, except that of clearing the inevitable litter from the car floor. There seems to be no provision made for extra car cleaners or street sweepers at the termini; and it is possible that the rent of 50s. per car per annum, which the contractor is to pay, would not allow for the necessary expenditure. But something should be done. The police department recently declined to permit boxes for waste tickets to

Digitized by Google

be put in the cars, and consequently little help can be expected from passengers; their pockets are generally filled, and there is no room for the sticky, gilded wrappings of the chocolate. The conductor has no time to collect waste paper, and the idea of an occasional bonfire on the car floor is clearly impracticable. Appeals must, we fear, be made to the enterprising contractor. Let him collect the rubbish and sell it for waste paper. The whole scheme, which opens up a new vista for tramway owners, is at present recognised as embryonic. The Council hope it will grow. Tramcars as peripatetic automatic restaurants, with profits on the scale of the popular cafés, may even yet prove tempting to investors whom the lure of "Greater Omnibus" enterprise has failed to attract. They might even give life to the market in tramway shares. It would be welcome. But we outrun the present. So far, all is experimental. The public must for six months limit their masticatory exercises to thirty-seven cars which run between Harlesden and Wandsworth, already known as the "chocolate" route. Later, it is hoped that the description may apply not only to every car, but to every route. The Council's ideal covers 2,000 cars, with passengers on each upper deck, "forty feeding like one." Then revenue will mount by leaps and bounds, and eager contractors will provide a rent for the boxes of nearly £4,000 per annum. But it is not merely the money that the Council want. In their report the Highways Committee explain this clearly. They say in so many words that "the supply of wholesome chocolate will afford a considerable benefit to tramway passengers." There is a sweet and engaging simplicity about this statement which is quite foreign to the matter of fact reports usually provided by the Committee. Guileless innocence may also be said to mark the reply of the Committee to the argument that they anticipate that the adoption of the chocolate boxes will lead to proposals for the automatic supply of other articles. The Committee's answer to this argument is that the grounds for providing passengers with the means of obtaining such an article as chocolate could not be advanced in the same degree in regard to any other article. It is felt that a tramway car cannot possibly become an American "store." In any case, too great a tendency in that direction, it is understood, would be promptly checked by the Commissioner of the Metropolitan Police. That officer has not yet given his consent to the new project, but the council hope that he will raise no objection to wholesome chocolate. It is true that he refused the project for the fixing of boxes for waste tickets. This useful scheme is in force in other towns, and revenue is got from the sale of old tickets as waste paper, but the Commissioner would have none of it; and if we remember right, he or his subordinates ordered a car experimentally fitted with these boxes off the street as "unfit for public service." If the chocolate box is rejected in like fashion, the decision will not therefore be wholly unprecedented, nor will it be greatly regretted.

## LINKING UP LONDON'S TRAMWAYS.

Last Tuesday the London County Council adopted an important report of the Highways Committee on the urgent necessity of linking up existing dead-end termini and otherwise consolidating the Council's tramway system. The Highways Committee said they were engaged in a careful study of the whole system with a view to improving the flexibility and usefulness of the system, to meet competition of other forms of traffic on more equitable terms, to facilitate further through running arrangements with outside authorities, and to make it easier to reduce the crowding together of the cars on certain lines.

Lack of success with previous schemes of the kind had been partly due to the failure of the Council to submit to Parliament a comprehensive scheme of development. The importance of the matter was accentuated by the findings of the recent Parliamentary Select Committee on Motor Traffic. The Highways Committee had directed the chief officer of tramways, the comptroller, the chief engineer, and the valuer to prepare a scheme for the consolidation and linking up. These officers would indicate the bearing of such proposals on the general tramway position, the cost and financial results of each tramway route separately, and the financial bearing of the scheme as a whole. To avoid delay the report was to be presented in two sections, the first giving details as to the lines which were necessary for which legislation should be promoted in the Session of 1915, and the second a general description with approximate figures of cost of lines which might hereafter be required. When the report was ready the committee would, if it appeared desirable, submit the scheme for examination and suggestion to an expert or experts to be recommended by the chief officer. The first part of the report would be available by about the middle of February next.

## SYNDICALIST STRIKE FAILS AT LEEDS.

Ostensibly on the ground that outside labour had been introduced into the Leeds power stations to fill the places of men who joined the strike of Corporation employees last week, the tramwaymen belonging to the Tramway and Vehicle Workers' Union decided, by 955 votes to 51, to withdraw their labour on Saturday last. It has transpired since that an agreement had been signed between the tramwaymen and the leaders of the other men that if the former came out to the assistance of the strikers the latter would give them support to the extent of a general strike in July next. In that month the tramway employees' agreement will be at an end, and they propose to negotiate fresh terms with the Corporation. Thanks to the formation of a Citizens' League, who provided volunteers as stokers at the power stations and gas works, and as sweepers of the streets, the various departments maintained their activity. The same remark is applicable to the tramways, although in the early part of the week the service had to be curtailed, while in order to prevent damage by stone-throwing the cars were withdrawn when darkness set in. Police reinforcements were forthcoming from neighbouring towns, and until Wednesday two constables accompanied each car. On the latter day the guard was reduced to one per car, and the man occupied a seat instead of being on the platform. About 100 motormen and conductors remained loyal on Saturday, and with the assistance of the clerical staff Mr. J. B. Hamilton, the general manager, was able to maintain a service of 70 cars upon all routes on Saturday. Each day saw an increase in the number of cars at work and in the number of employees who returned to work, foreseeing the failure of the Syndicalist venture to which they had been foolish enough to lend assistance. Mr. Hamilton was inundated with offers of help from the citizens, but he was able to rely entirely upon his own staff. From the first the tramways power station was also kept going with the department's own employees. By Tuesday the prospect of a wageless week-end proved sufficient to induce even the tramwaymen acting as pickets to desert their posts, and on Wednesday the workmen's car service was restored. On that day men began to dribble back to the other departments, and a much-advertised M.P. agitator, who had come to take part in an upheaval that was to have placed the citizens at the mercy of their employees, was suggesting that the men would be satisfied with reinstatement, abandoning the demand for an all-round increase of 2s. wages. A special meeting of the City Council, held on Wednesday, lasted only five minutes. The Corporation, on the motion of Alderman C. H. Wilson, decided to delegate all matters arising out of or in connection with the strike to a committee consisting of five aldermen, who are chairmen of committees, including Alderman R. A. Smithson, of the Tramways Committee. This body were given power to act, and the same evening they issued a statement instructing the chief officers of departments to receive up to 6.30 p.m. yesterday (Friday) applications from strikers for reinstatement. Nearly eighty tramway men turned at once, and on Thursday the remainder passed a resolution offering to resume work if they were accepted in a body. Mr. Hamilton's reply to this was that the men would be reinstated as quickly as opportunity offered.

## L.C.C. TRAMWAY MATTERS.

London County Council held their last weekly meeting before the Christmas recess on Tuesday, when a large number of reports were submitted. The next meeting will be held on January 20.

### ADDITIONAL TRAIL CARS.

The Highways Committee had considered the question of running a large number of trail cars on certain southern tramways, and application had been made to the Board of Trade. Pending the consent of that Board it was proposed that preliminary arrangements should be made. The Committee recommended that 150 new cars should be provided, and that 200 of the existing electric cars should be equipped with couplers. It was also proposed that tenders should now be invited, and that the tenderers should be asked to quote prices for 50, 100, or 150 trail cars. The specification for these should provide for (1) couplers of the type already supplied by the A.B.C. Coupler Company; (2) axle-box ball bearings of the Skelko self-aligning type; and (3) such special fittings as appeared to be most suitable in connection with the drop windows, blinds, and illuminated service numbers.

Digitized by Google

CANCELLING RETURN AND TRANSFER TICKETS.

A cancelling apparatus, the Committee stated, had been made for the purpose of obviating the necessity of using exchange tickets to passengers presenting return tickets. It was proposed that 1,500 of these machines should be obtained, the assembly of the different parts to be carried out by the staff of the tramway department. The total cost would not exceed 11s. 6d. a machine, or about £900 in all. The use of these machines would effect a reduction in the number of classes of tickets required by the conductors, and a saving of about £1,500 a year in connection with ticket printing and checking.

PLANING HIGH CHECKS ON RAILS.

Reference was made by the Committee to the expense and slowness of the present method of removing high checks on tramway rails by burning off by the oxy-acetylene process. This method also necessitated taking up the paving. Each set of plant could only work over seven yards an hour, and the cost was 3s. a yard. The Committee had been in communication with John Stirk and Sons, Limited, Halifax, the patentees of a machine for cutting the high checks, and this firm had offered to construct a machine for £1,020, capable of making a cut 1-32nd of an inch deep at speeds of 15, 30, and 45 feet a minute. The price, including trolley standard, plough, and connections, would be £1,120. The firm stated that the machine would plane off high checks at a minimum rate of 67 yards an hour. Moreover, the use of the machine did not necessitate the removal of the paving. The cost was estimated at 3½d. a yard including debt charges and the cost of labour and material. The machine was capable of being adjusted to take any required depth of cut, and it could therefore be used to prevent the formation of high checks. It was recommended that the tender by John Stirk and Sons, amounting to £1,020 for the supply of the machine, should be accepted.

AUTOMATIC CHOCOLATE MACHINES ON CARS.

The Committee proposed that subject to the consent of the Commissioner of Metropolitan Police an agreement should be made with Mr. A. H. Vincent providing for the fixing as an experiment of automatic chocolate boxes on the upper saloon decks of 37 cars operated from the Hammersmith depôt, the boxes to be provided by the contractor and fixed at his expense. Mr. Vincent would also supply the chocolate and have the boxes filled as required, and would collect the cash in the boxes. He would pay to the Council a rent of £2 10s. a year a car irrespective of the takings, provided that each car was worked on at least 300 days a year. The arrangement would remain in force for six months. The Committee stated that if the experiment were a success and the cars generally were fitted with these boxes a revenue amounting to nearly £4,000 would be secured by the Council.

## MISCELLANEOUS NEWS AND NOTES.

**New Cars for Manchester.**—The tramways department have been authorised to construct 25 car bodies for bogie trucks.

**Wearing of Union Badges.**—Halybridge, Hyde, Moseley and Dukinfield Tramways Board have agreed to allow the employees to wear their union badges.

**Leeds-Bradford Through Service.**—During the week the strike at Leeds interrupted the through service to and from Bradford. The Bradford cars stopped at the boundary.

**Next Week's Issue.**—Owing to the Christmas holidays, our next issue will be published on Wednesday. All communications should, therefore, be received not later than 6 p.m. on Tuesday.

**Increased Speed at Sheffield.**—The Board of Trade have sanctioned the raising of all limits of 6 miles per hour on the tramways to 8 miles and all limits of 10 miles to 12 miles per hour.

**Standing in Glasgow Cars.**—During the ensuing holidays the rule which forbids passengers to stand in covered double deck cars will be relaxed. Conductors are authorised to allow not more than half a dozen passengers to stand inside the lower saloon at the driver's end.

**Burnley Goods Wagon.**—The Board of Trade have sanctioned the running of the goods wagon on the tramways for an indefinite period, subject to a speed condition, and on the understanding that it may at any time be prohibited if considered necessary by the Board.

**The British Electrical and Allied Manufacturers' Association.**—At the Council meeting, held on the 18th inst., the firms of Fraser and Chalmers, Limited, Johnson and Phillips, Limited, Thomas Kesnor and Co., Limited, and the Record Electrical Company, Limited, were elected members of the Association.

**A Leicester Fatality.**—One workman was killed and another injured on December 16, by the explosion of an acetylene cylinder used in connection with repair work on Leicester Corporation tramways. The machine was being cleaned, and the deceased man examined it with a light.

**Merit Scheme for Nottingham Employees.**—The Tramways Committee have approved of a merit rank scheme for motormen and conductors to take effect early in the New Year. It is to be substituted for the bonus arrangement, to which the men have raised objection, and it will entail an outlay of £1,250 per annum.

**Tramway Insurance.**—Walsall Tramways Committee have reported their recession of a resolution deciding that on the expiration of the existing tramway indemnity policy the Council should bear the risk of claims. The committee have accepted the offer of the Ocean Accident and Guarantee Corporation, Limited, to insure them against third-party claims for a period of five years on terms considerably more favourable to the Council than those of the existing policy.

**Developments at Nottingham.**—As soon as the materials can be obtained there are to be extensions of the tramways from Sherwood to Daybrook, Derby Road to Wollaton Lodge, and Carlton Road to Carlton. The Board of Trade have been asked to inspect the extension just completed to the Carlton Hill boundary of the city. Twenty new cars are shortly to be purchased.

**The Railway Track Supply Company** (of Great Britain), 81, Gracechurch Street, London, E.C., have placed on the market a patent rail anchor, known as the "R.T.S." rail anchor, for use with bull headed rails. Tests that have already been made with this device show that it will eliminate rail creep on bull-headed track. The company will be pleased to supply a few samples free of charge for trial purposes.

**An Unusual Mishap at Nelson.**—In the belief that the motorman was on the platform the conductor of a Nelson Corporation car on December 16 gave the signal to start, shifted the trolley arm, and released the brake at his end. The car was standing at the centre on the line leading to the Leeds Road section, and when it began to descend the slope the conductor saw that the driver had been left behind. Before the car was brought to a standstill it upset a horse and cart.

**Price of Energy for Walthamstow Tramways.**—After considerable discussion, extending over a period of some months, the Walthamstow Urban District Council have decided to reduce the charge for energy supplied to their tramways from 1⅜d. to 1¼d. per unit. As this will make a difference of some £500 per annum in the working costs the loss on the undertaking will be appreciably reduced. Even with the reduction the price still remains at a figure that can scarcely be justified.

**Municipal Tramways Association and Omnibus Traffic.**—London County Council have appointed the vice-chairman of the Highways Committee, the chairman and vice-chairman of the Local Government Records and Museums Committee, the chairman of the Public Control Committee, and Mr. H. H. Gordon and Mr. Henry Ward to represent the Council at the proposed conference with the Executive Council of the Municipal Tramways Association on the subjects of motor omnibus traffic, road maintenance, etc.

**Colonial Complaint Against British Manufacturers.**—The chairman of the Hobart Corporation tramways has presented a report from Mr. A. C. Parker, the general manager, stating that owing to the non-arrival of the points and crossings and the extra heavy rails for curves, the construction of the West Hobart extension had been delayed. The chairman said business men would bear him out that when orders were sent Home for materials and goods, etc., 12 months often elapsed before their arrival. He admitted, however, there had been a very great demand for rails from all over the world.

**No Christmas Car Services.**—Acting on a vote of Warrington Council, the Tramways Committee have agreed to give the tramways employees a full day's holiday on Christmas Day. As in past years, the car service will be entirely suspended in Nottingham. The Tramways Committee refused an application made by Notts Forest F.C. for a service to be run to the Meadow Lane ground. Consequently football followers will have to walk three or four miles. It was pointed out that were the concession to be granted, religious bodies and organisers of large parties would have an opportunity of asserting their claims.

**Effects of Car Meters at Derby.**—In the annual report of Derby Corporation tramways the economy in expenditure on current due to the use of traction meters is estimated at £745. As showing the effect of the meters on the driving it is mentioned that only 600 brake shoes were issued from the stores, a decrease of 320, notwithstanding a slight increase in mileage. The average consumption of electricity per car mile was 1,168 units, the lowest since the first year of the system, 1904-5, when the average was 1,042. The total consumption was 1,357,232 units at a cost of £8,109, these totals comparing with 1,480,150 and £9,026 respectively for the previous year.

**Birmingham and Trail Cars.**—Councillor Harrison Barrow, chairman of the Tramways Committee, has informed a Solly Oak audience that in April, 1911, the city possessed thirty-four miles of tramways, and on March 31 last there were sixty-two miles. The Corporation now had six hundred cars. The sum of £220,000 had been placed to the reserve fund and £215,000 to the sinking fund, on a capital of two millions. In four years they had practically put by 20 per cent. of the capital, which was a good record. The committee hoped shortly to have a number of trail cars running. These would be a great convenience to the workmen, greatly increasing the accommodation at a small expense.

**Increased Fares Yield Higher Receipts.**—A revised scale of fares has been arranged by the Paisley District Tramway Company. The general effect is to increase the charge from Paisley Cross to Renfrew, Barrhead, and Johnstone centres respectively by ½d. An additional stage has been added to the Renfrew section, making it even, in unison with the others. Workpeople will still have two stages for ½d., four for 1d., but seven stages will now be 1½d. instead of 1d. The increased charges do not affect travellers within the burgh or the immediate residential districts. When the new fares came into force on December 15 less workmen were carried on the Renfrew route, but Mr. Coutts, the manager, stated that the revenue was greater. If this diminution in numbers continued, he added, it would enable the company either to withdraw the car or by diminishing overcrowding to give greater comfort to those travelling. The missing passengers on the Renfrew section travelled by train.

**The Double-Deck Railless Cars for Brighton.**—Having regard to the fact that the conditions of traffic in the chief business through-

Digitized by Google

fares forming the through route between Brighton and Hove are very different from those pertaining in other towns where railless traction has been adopted, the Hove Corporation have asked Brighton Council to first try the double-deck cars on a test route. This type of car has been sanctioned by the Board of Trade subject to the overall width being reduced to 7ft. and to the body of the vehicles being at least ten inches above the surface of the road. The Board also state that the sanction will be subject to such special regulations as to speed, stops, passing points, etc., at narrow places as may be found to be necessary when the inspection of the system takes place. Brighton Corporation on December 18, on the recommendation of the General Purposes Committee, decided to equip a section on the Preston Road route, at a cost of £115, and to run the double-deck vehicle thereon for demonstration purposes. Although passengers may ride, no fares will be taken. The thoroughfare will be closed after January 19 next in order to permit the relaying of the tramway track and wood paving, but the committee consider that the interval will be amply sufficient for a demonstration of the capabilities of the car. The committee have themselves no doubt respecting its efficiency.

**Tilling's New Commercial Vehicles.**—For some time past Thomas Tilling, Limited, have been using, in connection with their business, special delivery vehicles of their own manufacture, suitable for dealing with loads up to two tons. These vehicles proved most satisfactory, and as a number of users of commercial vehicles had approached Messrs. Tilling to supply motor vans and lorries of their manufacture, of capacities up to two tons, for speedy deliveries, a number of these have been supplied and are being used by the General Post Office, London County Council, Glyn, Mills, Currie's Bank, Messrs. Peek, Frean, Messrs. McVitie and Price, and Fremlin Bros. The demand for these vehicles has, however, so rapidly increased, and the capacity of Messrs. Tilling's London works has been taxed to such an extent, that they are unable to cope with orders, and as a consequence have made arrangements with W. A. Stevens, Limited, whose works at Maidstone have during the past year been considerably enlarged, to manufacture the vehicles and handle the sales. For the heavier type, to deal with loads from 2½ to 5 tons, the Tilling-Stevens petrol-electric chassis, which is manufactured by W. A. Stevens, Limited, will be supplied, but in order to distinguish the two types of vehicles, those for loads up to two tons will be known as the Tilling chassis. Vehicles for heavier loads will be known, as heretofore, as the Tilling-Stevens petrol-electric chassis. Full particulars, prices, etc., for both types can be obtained from W. A. Stevens, Limited, 26, Victoria Street, Westminster, S.W.

## CONTRACTS AND ORDERS.

**Leyland Motors, Limited,** have received an order from Accrington tramways department for a petrol motor tower wagon.

**Prahran and Malvern Tramways Trust** have given a contract to the Steel Company of Australia for points and crossing, at £917.

**Winnipeg Council** have awarded contracts to the Canadian General Electric Company for three 600 kw. transformers and to Ferranti, Limited, for switches.

**Halley's Industrial Motors, Limited,** have received two orders for petrol tower wagons from Glasgow Corporation, and a second order from Leith Council for a 25 h.p. tower wagon.

**The Anger Manufacturing and Supply Company, Limited,** of Bank Chambers, Preston, have received an order for 150 more sets of their brake adjuster for the Anglo-Argentine Tramways of Buenos Ayres.

**Norwich Council** have placed a contract with C. A. Parsons and Co., Limited, for a 3,000 kw. turbo-alternator, complete with condensing plant, at £8,588, two 1,200 kw. rotary converters by Siemens Bros. Dynamo Works, Limited, at £4,240.

**Chesterfield Council** have placed the following contracts:—Three car bodies at £469 each, Brush Electrical Engineering Company; electrical equipment for three cars, at £282 per car, and electrical track brakes at £55 each, British Westinghouse Company.

**West Hartlepool Council** have allotted contracts as subjoined:—Five tramcars with flexible axle trucks, United Electric Car Company, Limited; electrical equipments and spare parts, Dick, Kerr and Co., Limited; points and crossings, Hadfield's Steel Foundry, Limited. Mr. W. S. Tatham, of West Hartlepool, is to be negotiated with in reference to his quotation for taking out the quantities for the car shed extension.

**Siemens Brothers Dynamo Works, Limited,** have received the contract for supplying the switchgear and accessories for the electric power station in connection with the Melbourne suburban railway electrification scheme, the amount being £140,000. The plant will be manufactured in Great Britain. The contract for the condensing plant has been awarded to the G. Weymouth Proprietary, Limited, of Richmond (V.), at £85,251.

**London County Council** have accepted the following tenders:—John Stirk and Sons, Limited, Halifax, machine for cutting high checks on tramway rails, £1,020; Mr. R. L. Lundgren, Queen Victoria Street, E.C., 125 tons of white and 200 tons of coloured pulp for tramway tickets, at £10 a ton for white and £11 a ton for coloured, less 5 per cent. discount; Mr. R. R. Todd, High Holborn, W.C. (agent for Felten and Guilleaume), 2½ tons of T.C.C. copper wire, .220 inch diameter, £84 11s. 8d. a ton, and 7½ tons of D.C.C. copper wire, .220 inch square, £85 15s. a ton, both less 2½ per cent. discount; Newton Brothers, spare materials for reconstruction and re-winding of motor generators, £320 7s.; J. G. Ingram and Son, Hackney Wick, N.E., repair of 200 burnt and damaged moulded indiarubber plough bases, £206 5s.

## PERSONAL.

**Mr. J. B. Hamilton,** of Leeds, has been engaged to advise Ealing Council in the negotiations with the London United Tramways Company.

**Mr. J. Wild,** inspector in charge of the railless trolley cars of Ramsbottom Council, has received an increase of salary and been appointed manager.

**Mr. Gordon Bryant,** electrical engineer to Great Yarmouth Council, has had his salary increased from £400 to £450, to be followed next September by an addition of £50.

**Alderman Smethurst** is to be presented by the Warrington Electricity and Tramways Committee with a vote of thanks, engrossed on vellum, in recognition of his many years' service on the Committee.

**Mr. H. Underwood,** repairs foreman at Greenwich generating station of London County Council tramways, has been appointed boiler house charge-engineer, at a salary of £250 a year, rising by annual increments of £10 to £300 a year.

**Mr. L. Garner McLean,** chief assistant power and distribution engineer to the London United Tramways Company, on leaving to take a position in India, has been presented by the staff with a case of drawing instruments, a pipe, and a cigarette holder.

**Messrs. C. W. Bentley and R. Watson,** respectively manager and electrical engineer and secretary of the Musselburgh Tramways Company, were referred to by Bailie Constable at the annual concert of the Recreation Club, as having interested themselves in all that tended to the welfare of the borough. He also spoke of the civility of the employees, and remarked that the tramways had done much to give the people better travelling facilities, for the competition had induced the railway company to give a better train service.

**Mr. A. C. Morgan,** late manager to the Burmah Electric Tramways Company, was referred to by Mr. Ellis, who presided at the annual meeting. He joined the company's service at the beginning of the company's operations as assistant manager, and since August, 1908, had been in charge. The chairman stated that Mr. Morgan retired on October 31 on the expiration of his agreement, and the directors desired to place on record their appreciation of the excellent services rendered by Mr. Morgan. As the system was now thoroughly well organised, the directors had not filled the vacancy, and the duties were being carried out by the chief engineer, Mr. A. H. Burbidge, under the title of chief engineer and manager. Mr. Burbidge went out from England quite recently, and had had a very thorough experience of similar work here.

**Glasgow Salaries.**—By 32 votes to 19, the Corporation have adopted the following scale of salaries recommended by the Tramways Committee:—General manager—Minimum salary per annum £1,000, maximum salary £1,400, annual increment each year until the maximum is reached £50; salary of present holder of the office, £1,100. Traffic manager—Minimum £400, maximum £700, annual increment £25; present salary, £625. Chief engineer—Minimum £400, maximum £700, annual increment £25; present salary, £625. Electrical engineer—Minimum £400, maximum £700, annual increment £25; present salary £575. Secretary and treasurer—Minimum £400, maximum £700, annual increment £25; present salary, £425. Replying to an objection that the general manager's ultimate salary of £28 per week would be more in pounds than the lower-paid conductor would have in shillings, Mr. Alexander said that general managers of tramways such as those in Glasgow received much larger salaries than they had ever thought of paying Mr. Dalrymple. Denying that they had turned a deaf ear to the workers, he compared the wages and hours of the men when the Corporation took over the tramways with those of the present time.

**Inspector T. Meadows,** of the Southport Tramways Company, died suddenly on December 16, at the age of 65. For many years he had had charge of the traffic in London Square.

**Mr. John Glenn,** consulting engineer to the Portsdown and Horndean Light Railway, and a director of the company, died a few weeks ago. At the annual meeting of the sick benefit club of the employees, Chief Inspector W. Mathews proposed a vote of condolence with Mr. J. Fereday Glenn, the engineer and manager, and son of the deceased gentleman. Mr. Glenn, who was 75 years of age, had been connected with the Provincial Tramways Company for forty years as consulting engineer to that company and its local undertakings. He was a brother of Mr. J. Barber Glenn, the managing director.

## FINANCIAL REPORTS AND MEETINGS.

**The British Electrical Federation.**—The traffic statement for the week ended December 13, 1913, shows that the receipts from tramways and railways amounted to £32,178, as compared with £36,863 in the corresponding week last year, and from omnibuses £12,147, as compared with £1,688, making a total of £44,325, as compared with £38,551. The tramway and railway route mileage was 429.82, as compared with 428.47. Upon such of the services as were working both last year and this year, the receipts show a decrease of £4,564 upon the week. No receipts are included from Auckland tramways, the services having been temporarily suspended owing to the strike of wharf labourers. Full services have since been resumed, and are now working normally.

**A Warning from Newcastle-on-Tyne.**—Alderman J. H. Rodgers, presiding at a meeting of the Newcastle Corporation Tramways Committee, stated that during the last half-year the receipts had been £123,000, compared with £111,000 in the corresponding period of last year. The expenditure had increased by £11,000, and 2¾ million more passengers had been carried. Owing to the altered

Digitized by Google

judgment in the Tottenham rating appeal, the committee had to pay back over £3,000 for rates which they had allowed last year under the judgment. The net surplus had decreased nothwithstanding the very large increase of traffic. This was due to the increased cost of carrying on the department. The men had got more money, and there had been more men engaged to do the extra work. Now that the system was getting older the repairs were getting heavier, and coals were almost double the price. During the half-year they had spent out of the reserve fund £21,060 for re-laying cables, alterations to cars, the re-laying of the permanent way, and new machinery at the power station, etc. This work would continue each half-year, and the possibility was that during the next six months there would be anything from £10,000 to £20,000 thus spent; and it would be necessary to build up that reserve fund again to the extent that they were depleting it. They could not go on granting concessions right and left.

## COPPER AND ALUMINIUM MARKET.

December 19, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton :—

## WEEKLY TRAFFIC RETURNS.

The official traffic returns of 59 of the principal undertakings of the United Kingdom for the week ended December 13 amounted to £214,979, or £7,410 more than in the corresponding week last year, while the track mileage was 2,749, or 75 more than for the corresponding week. The receipts were at the rate of £78 4s. per track mile, an increase of 11s. 6d. per mile as compared with last year.

(*Continued from page* 542.)

## BOROUGH OF PLYMOUTH.

Notice is hereby given that after the expiration of ten days from the date hereof the Corporation intend to enter into contracts for the supply of the following Goods and Materials for one year :—

Schedule No.—3. Section A.—Paints. Section B.—Varnishes. 5. Ironwork. 7. Petroleum Oil. 8. Broomheads. 9. Household Brushes. 11. Iron and Steel. 13. Pitchpine Deals, Flooring, etc. 14. Carbolic Powder. 15. Portland Cement. 16. Lubricating Oils. 17. Tar and Pitch, including refined tar for use in the construction of tarred macadam roads and for tar spraying. 18. Painters' Brushes. 19. Explosives. 22. Soap. 23. Wood Blocks, Soft. 24. Creosote. 27. Road Metal. 28. Disinfectant Fluid (Bacteriological Test). 29. Granite Kerbs, Setts, etc. 30. White Lead, Red Lead, Linseed Oil, and Turpentine. 31. Refilling Machine Revolving Brooms. 33. Benzoline and Motor Spirit. 34. Tools. 35. Indiarubber Goods, Hose, etc. 36. Ship Chandlers' Goods (Sundry Oils, Waste, Grease).

Tenders must be based on the whole of a Schedule (with the exception of Schedules Nos. 3, 4, 22, 29, and 36), and not on any particular item contained therein.

(Separate tenders will be considered for Sections A. and B. of Schedule No. 3.)

Schedules may be obtained on payment of a deposit of £1 in cash for each Schedule. The deposits on the Schedules will be returned, provided *bonâ-fide* tenders are received on or before January 17, 1914. Should the contractor withdraw his tender, or fail to send in one, the amount of his deposit will be forfeited, and the contractor who applies for the Schedules must do so on the distinct understanding that he is willing to abide by the terms of this advertisement.

The lowest or any tender will not necessarily be accepted.

Tenders to be delivered not later than Saturday, January 17, 1914, addressed to the undersigned.

JAMES PATON,
Borough Engineer and Surveyor.

Municipal Offices, Plymouth,
December 21, 1913.

## COUNTY BOROUGH OF SOUTHAMPTON.

TRAMWAY UNIFORMS.

The Corporation invite tenders for the supply of Uniforms for the employees of the Tramways Department.

Form of tender may be obtained and samples inspected at the Manager's Office, 161, Above Bar Street.

Sealed tenders, on the printed form, endorsed "Tender for Tramway Uniforms," must be delivered at the Town Clerk's Office on or before January 2, 1914.

No pledge is given to accept the lowest or any tender.

R. R. LINTHORNE,
Town Clerk.

Town Clerk's Office,
Municipal Offices, Southampton,
December 12, 1913.

## POSITIONS VACANT.

### COUNTY BOROUGH OF SUNDERLAND.

DISTRIBUTING SUPERINTENDENT.

Wanted, Superintendent to take charge of underground E.H. Tension and L. Tension Main; one with experience of fault localising and maintenance upon old rubber draw-in system and unbonded lead-sheathed cables on solid system preferred.

Salary £182 per annum rising by increments of £13 per annum to £208.

Applications in own handwriting, stating age, experience, when duties could be commenced, and accompanied by copies of testimonials to be sent to the undersigned as soon as possible.

ALFRED S. BLACKMAN, M.I.M.E., M.I.E.E.,
Engineer and General Manager,
Electricity Offices,
Dunning Street, Sunderland.

### MECHANICAL DRAUGHTSMAN.

Wanted at once, first-class Mechanical Draughtsman, one who understands tramway truck construction. Address at once, stating experience and salary wanted, Anger Manufacturing and Supply Company, Limited, Bank Chambers, Preston.

**Telephone: No. 2948 GERRARD.**

# WEEKLY LIST OF TENDERS INVITED.

## CITY OF BIRMINGHAM.

TRAMWAYS DEPARTMENT.

The Tramways Committee are prepared to receive tenders for the supply of Stores as set forth in the following Schedules, during the year ending March 31, 1915:—

Schedule No.
1 Glass.
2 Iron and Steel.
3 Leather and Rubber Goods.
4 Cotton Waste, White Rags, and Sponges.
5 Paint, Varnishes, etc.
6 Springs.
7 Electrical Sundries.
8 Oils, Greases, etc.
9 Chemist's Sundries.
10 Iron and Steel Castings.
11 Malleable Iron Castings.
12 Insulating Materials.
13 Paint and other Brushes.
14 Files.
15 Ironmongery.
16 Bolts and Nuts, Washers, etc.

Conditions of contract and form of tender may be obtained on application to the undersigned.

The tender, filled up as directed, must be enclosed in a sealed cover, addressed to the Chairman of the Tramways Committee, and endorsed in the left-hand corner, and delivered to the Tramways Offices, The Council House, Congreve Street, Birmingham, not later than 12 o'clock noon on Monday, the 26th day of January, 1914.

ALFRED BAKER,
General Manager.

Tramways Offices,
The Council House,
Congreve Street, Birmingham.

## CORPORATION OF EDINBURGH.

TO MOTOR OMNIBUS BUILDERS.

TENDERS FOR MOTOR OMNIBUSES.

The Magistrates and Council are prepared to receive tenders for the supply and delivery of Motor Omnibuses not exceeding six.

General description, specification, conditions of contract, sketch drawings, and forms of tender, together with any other information, may be obtained from Mr. A. Horsburgh Campbell, M.Inst.C.E., Engineer, Parliament Square, on payment by crossed cheque of £2 2s. deposit, which will be returned on the receipt of a *bonâ-fide* tender.

Sealed tenders, endorsed "Tender Motor Omnibuses," and addressed to the undersigned, to be delivered not later than 10 a.m. on Wednesday, January 7, 1914.

The Magistrates and Council do not bind themselves to accept the lowest or any tender.

THOMAS HUNTER, W.S.,
Town Clerk.

City Chambers, Edinburgh,
December 17, 1913.

## THE GREAT INDIAN PENINSULA RAILWAY COMPANY.

STORES.

The Directors are prepared to receive tenders for the supply of the following Stores, namely:—

| | |
|---|---|
| Cranked Fishplates. | Tie Bars, Gibs, and Cotters. |
| Steel Rails and Fishplates. | Rail Lifters. |
| Points and Crossings. | Brass Strips, Angles, etc. |
| Steel Fishbolts, etc. | Canvases. |
| Cast Iron Sleepers. | Carriage Fittings. |

Specifications and forms of tender may be obtained at this office on payment of the fee for the specification, which payment will not be returned.

Tenders must be delivered in separate envelopes sealed and addressed to the undersigned, marked "Tender for Cranked Fishplates," or as the case may be, not later than 11 o'clock a.m. on Thursday, January 1, 1914.

The Directors do not bind themselves to accept the lowest or any tender.

R. H. WALPOLE,
Secretary.

Company's Offices,
48, Copthall Avenue, London, E.C.,
December 22, 1913.

## COUNTY BOROUGH OF WEST HAM.

TRAMWAY TICKETS.

The Council hereby invite tenders for the supply of Tramway Tickets.

Specification and form of tender may be obtained at the Office of Mr. J. S. D. Moffet, Tramways Manager, Greengate Street, Plaistow, London, E., upon payment of £1, which will be returned upon receipt of a *bonâ-fide* tender.

Note.—No tender will be considered unless the same is delivered at the Office of the Town Clerk, Town Hall, West Ham, E., in the envelope supplied, by Registered Post, not later than 12 o'clock noon on Tuesday, January 6, 1914.

The Council do not bind themselves to accept the lowest or any tender. The contractor will be required to enter into a bond, with one surety, for the due performance of the contract.

The contractor whose tender is accepted, and with whom a contract is entered into, will be required to pay to the whole of his workmen such rate of wages, and observe such hours of labour as are recognised by the Workmen's Trades Unions, and shall not assign, nor underlet, or make a sub-contract with any person or persons for the execution of any part of such work. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

By order of the Council,

H. W. GREAVES,
Town Clerk.

Town Hall, West Ham, E.,
December 19, 1913.

## COUNTY BOROUGH OF WARRINGTON.

ELECTRICITY DEPARTMENT.

The Electricity and Tramways Committee of the County Borough of Warrington invite tenders for Weldless Steel Pipes for feeding Boilers.

Specification and form of tender can be obtained from the undersigned on payment of one guinea, which will be returned on receipt of a *bonâ-fide* tender. Five shillings will be charged for extra copies of specification.

Tenders, addressed to the Chairman of the Electricity and Tramways Committee, Town Hall, Warrington, must be sealed with wax and endorsed "Tender for Steel Pipes," and delivered not later than 12 o'clock noon on Wednesday, January 7, 1914.

The lowest or any tender will not necessarily be accepted.

F. V. L. MATHIAS, M.I.E.E.,
Borough Electrical and Tramways Engineer.

Howley, Warrington.

## COUNTY BOROUGH OF SWANSEA.

ELECTRICITY DEPARTMENT.

The Corporation of Swansea invite tenders for one or two years' supply and delivery of :—

(*a*) Motors.
(*b*) Starting Switches.

Copies of the general conditions, specifications and forms of tender can be obtained on and after Tuesday next, the 23rd instant, from Mr. C. A. L. Prusmann, Borough Electrical Engineer, on payment of one guinea for each specification, which amount will be returned on receipt of a *bonâ-fide* tender. Additional copies of the specification can be obtained at 5s. per copy, which amount will not be returned.

Sealed tenders, endorsed "Motors," or/and "Starting Switches," to be delivered at my offices not later than noon on Thursday, January 8, 1914.

The Corporation do not bind themselves to accept the lowest or any tender.

H. LANG COATH,
Town Clerk.

Guildhall, Swansea.

## COUNTY BOROUGH OF HALIFAX.

TENDERS FOR TROLLEY WIRE.

The Tramways Committee of the Halifax Corporation invite tenders for the supply of 10 Miles of Trolley Wire. Full particulars may be obtained on application to the Tramways Engineer, Skircoat Depôt, Halifax. Tenders, endorsed "Trolley Wire," must be sent to the undersigned not later than Wednesday, December 31, 1913. The person whose tender is accepted will be required to observe the Fair Contracts Clauses adopted by the Corporation. The Committee do not bind themselves to accept the lowest or any tender.

By Order, PERCY SAUNDERS,
Town Clerk.

Town Hall, Halifax,
December 19, 1913.

## POSITION WANTED.

### TRAMWAY MOTORMAN.

Tramway Motorman (Scotch), thoroughly experienced, desires change to some English tramway system. Would like situation as motorman on electric railway system. Abstainer. 25. No. 33, THE TRAMWAY AND RAILWAY WORLD, Amberley House, Norfolk Street, London, W.C.

MOORGATE STREET, LONDON, E.C.

## TRAILER CARS.

There is at length a prospect of a large development of the use of trailer cars on tramways in this country. In the days of steam tramway trains consisting of a locomotive hauling a car were commonly in use, but when electric traction began the trailer arrangement very soon disappeared. Perhaps one of the reasons for this was that the steam tramway in any shape was somewhat disagreeable, and the associations connected with a steam engine hauling another car were perhaps sufficient to discourage the spread of a method whereby an ordinary electric car would pull another car, the latter of which would not be provided with anything in the way of motors. The Board of Trade always profess to be willing to consider applications from tramway authorities for leave to use trailers, and each case is considered on its merits in the light of the local circumstances. As a matter of fact, however, the Board of Trade have been very chary in granting such permission, and even where it has been granted the running of trailer cars seems to have been in most cases discontinued. Perhaps the most notable example in past years of the use of trailer cars on an electric tramway was in Leeds, where highly satisfactory financial results were obtained, owing to the fact that while the trailer car could accommodate almost as many people as the motor car, its use did not add very considerably to the working expenses. That is to say, if the cost of running the ordinary cars was, say, 7d. per car mile, the cost per train mile for a motor car and trailer car might be approximately 11d. or 1s. at the outside. The trailer car can, of course, be built very light, as it has to withstand no driving stresses and carries practically no mechanism except that for the brakes. The problem of dealing with the enormous traffic at the rush hours in London led to the subject of trailer cars being revived there two or three years ago, and the London County Council obtained the authority of the Board of Trade to run a few two-car trains experimentally. The Commissioner of Metropolitan Police, however, after a few months vetoed the experiment, and it was found impossible to run trailer cars in London until an Act of Parliament was obtained giving authority to do so. In the session of 1912 the County Council sought such powers in their Tramway Bill of that year, and while the measure was pending we published in these columns a series of letters from Continental tramway managers showing the great advantages experienced abroad from the use of two-car trains. In spite of the opposition of the Metropolitan Police, Parliament granted the County Council the desired authority so far as the southern system of tramways was concerned, and subject to the approval of the Board of Trade. After a little experimental running in the south-east of London trailer cars were last summer put on the route between Victoria Embankment and Tooting. These trailer cars, eight in number, have proved of enormous advantage on this route, which is one of the most heavily loaded in the Metropolis. The trailers are simply old horse cars which have been adapted for the purpose. The Board of Trade appear to be satisfied with the arrangement as to couplers and brakes, while the public have the advantage that a motor car and trailer together can seat 120 or 130 people. Now the announcement comes that the County Council are about to invite tenders for the construction of 150 new trailer cars, so that the advantage of running two-car trains may be extended over a large proportion of the southern tramways. Once all these cars are running quite a new era will be opened in tramway transportation in South London, and it may even be found practicable during the busiest hours to run the trains at slightly longer intervals than has been necessary when using single cars. This, of course, would reduce traffic congestion while giving the fullest accommodation for passengers. The use of trailer cars now promises to extend in various towns. In Birmingham the Tramways Committee hope soon to have a number of trailer cars running. Probably with a view to avoid any uncertainty as to getting the consent of the Board of Trade, four tramway authorities are seeking statutory powers in the coming session of Parliament to run trailer cars. These are the London United Tramways Company, Bolton Corporation, Newcastle-on-Tyne Corporation, and Walsall Corporation. In addition to the great economy arising from the use of trailers it has always to be remembered that they enable the management to cope with enormous rushes of traffic with which it is impossible to deal satisfactorily with single cars.

## TRAFFIC IMPROVEMENT.

The great improvement in the receipts of the London County Council tramways provides an indication of what can be done in the way of traffic promotion by careful study of a particular situation. There is no universal rule by which a public transport undertaking can build up a business. Each case must be considered by itself, and dealt with in relation to the local circumstances. Painstaking and constant observation and experiment will, however, bring about an improvement even in the most unpromising conditions. The traffic manager and his assistants cannot be too often on the lines, for only by personal inspection of the traffic, the habits of the people,

Digitized by Google

and the way in which the existing service meets, or fails to meet, the public requirements can a service be better adapted to secure all the available traffic. Aside from the institution of new or special services, and a change of routes or schedules, which will from time to time be desirable, there is always an opportunity for increasing the regular and punctual running of the cars. Where these are habitually faulty something is wrong and needs attention. It is not enough to allege, for instance, that a line is a particularly difficult route to work; that at certain parts it is congested; and that the service must in consequence be imperfect. There are ways of improving even the most awkwardly situated route. There are lines on which not infrequently two or three cars pass in one direction without a car on the opposite track coming in sight. Irregularity such as this in time becomes irritating, and passengers are taught by painful experience that pedestrianism is a surer if slower mode of progression than the tramway service. The number of fares thus lost on lines where the service is poor amounts to an appreciable sum in a week; and in many cases we are convinced that more careful inspection of car services would bring about marked improvement. Constant watchfulness will accomplish much that at first sight seems impracticable. "Difficulties exist only to be overcome," was the constant retort of a chief to whom juniors came making complaint that some obstacle prevented the carrying out of new plans. That rejoinder in time created an attitude of mind which was invaluable as an incentive throughout the undertaking. As a working hypothesis nothing could be better, and it may be commended to traffic departments of any of our tramways where there is a tendency to let matters fall into a rut, or to look at improvement as impracticable.

## MERIT RANK SCHEME FOR NOTTINGHAM EMPLOYEES.

Approval has been given by Nottingham Tramways Committee to a merit rank scheme for drivers and conductors, in lieu of the bonus system to which the employees had objected. The new scheme was prepared by Mr. J. Aldworth, the general manager, and it also had the careful consideration of Councillor R. H. Swaine, the chairman of the committee. Appended are the details of the scheme:—

The men will be enabled to gain the right of wearing stripes on their uniform—one stripe for the third class grade, two stripes for the second class, and three stripes for the first class.

Each stripe carries with it payment at the rate of 1s. per week for the time worked, subject to certain conditions specified below:—

(1) That such merit grades, and the weekly payments attaching, shall be continued and remain in force only at the discretion of the Tramways Committee.

(2) That the payment of these weekly amounts shall not be considered part of an employee's wages, but only as a reward for meritorious service.

(3) That no employee shall qualify for merit rank by length of service alone, as the promotion will also depend upon the following qualifications having been reasonably observed:—

(*a*) Civility and attention to passengers.
(*b*) Freedom from blameable accidents.
(*c*) Cleanliness of person and uniform.
(*d*) Showing up for duty at schedule time.
(*e*) Keeping a good look-out for passengers.
(*f*) Careful running and working of car.
(*g*) Economy in use of electrical energy.
(*h*) Careful observance of rules and regulations.

(4) Should a motorman or conductor holding merit rank render himself unworthy by breach of discipline, careless working, or general misconduct, he may be deprived of one or more stripes with the weekly payments attaching, for such a period as the circumstances of the case may be considered to warrant; but in the case of an employee not in possession of a stripe, it may be met by deferring promotion to merit rank for such a period as may be deemed necessary or advisable.

(5) That promotion to merit rank for which a motorman or conductor may become eligible shall not be withheld, nor shall promotion to either grade be cancelled, without the reasons for such action being stated by the general manager, and an opportunity given for laying before him either personally or in writing, as the employee may prefer, any explanation he may have to make, or reason to advance why promotion should not be withheld or cancelled as the case may be.

(6) Should a motorman or conductor consider his case has not been fairly dealt with he shall have the right to appeal to the Tramways Committee, notice of which must be given to the General Manager in writing.

(7) That to be eligible for promotion to the third class grade, an employee must have been continuously in the service of the Tramways Committee as a full-time motorman or conductor for a period of three years.

(8) For promotion to second class grade, he must have been continuously in the service for a further period of five years.

(9) Before becoming eligible for promotion to the first class grade, he must have continued in the service for a still further period of five years.

(10) That these various periods shall commence from the time an employee is appointed to a full service, including holiday reliefs and the working alternately as conductor and motorman.

(11) That it shall be within the discretion of the Tramways Committee to appoint to merit rank, or promotion to a higher grade, any employee who by special service may, in the opinion of the Committee, be so deserving, irrespective of the period he may have been in the service of the department.

It is proposed that the scheme shall take effect early in 1914.

## OXFORD OMNIBUS DIFFICULTY.

By a majority of 21 the Oxford City Council have defeated, for a second time, a motion instructing the city solicitor to issue a writ to recover damages due from the Tramways Company and the National Electric Construction Company under the Acts of Parliament and other documents relating to the Oxford tramways. On December 15, the Town Clerk informed the Council that a memorial in favour of the omnibuses had been received which bore upwards of fourteen thousand signatures. Application had also been received from several companies for licences to run 'buses. A report was presented from the Parliamentary Committee recommending that steps be taken to obtain an injunction restraining the Oxford Motor Omnibus Company and their manager from running omnibuses within the city of Oxford without first obtaining a licence. The city solicitor said that he had consulted Mr. Macmorran, K.C., who gave it as his opinion that the Tramway Acts did not in any way interfere with the right and duty of the Corporation to consider upon its merits every application for an omnibus licence, and to grant such licence in every case in which they considered it was to the public advantage to do so. The Corporation might, if they wished, state that they were prepared to consider applications for licences and to decide each case upon its merits. The matter was referred to the Council in committee.

Messrs. Tilling, Limited, have offered to run a service of petrol-electric vehicles, and to make a payment for the privilege. On December 18, the Watch Committee agreed to recommend that five licences each be granted to the three companies who had made application, namely, Messrs. Tilling, Limited, Mr. Cownie, of the National Electric Construction Company, and Mr. Morris, of the Oxford Motor Omnibus Company. Prior to the meeting of the committee twelve omnibuses were drawn up for inspection outside the Municipal Buildings, the vehicles comprising eleven sent by Mr. Morris and one by Messrs. Tilling. No inspection was made by the police, however, and after some delay the vehicles were removed. On the same day Mr. Morris started a service of eleven omnibuses to all parts of the city, and he stated that he looks upon the proposal to license five omnibuses of each company as quite an impossible one. So far as he is concerned he says that "it will be twelve or nothing, because it would not pay to run merely half a dozen." "I am determined," he added, "to fight the matter to an end."

## WHERE FREE PASSES ARE GRANTED.

A report has been presented to the Brighton Tramways Committee by Mr. W. Marsh, the engineer and manager, on the information he had gathered from other towns on the question of tramway passes for members of the Corporation. West Ham and Southend were the only undertakings that issue free passes to all members of the Council. In Aberdeen passes were granted between members' houses and the municipal buildings; in Bournemouth half the cost of the members' annual tickets was paid by the Corporation, and in Sheffield and Liverpool passes were granted to members of the Tramways Committees only. In eleven other towns passes were granted to the Chairman of the Tramway Committee, and in some of these towns passes were also issued to the Mayor and Vice-Chairman of the Tramways Committee. In Stockport the Tramways Committee had relinquished the passes owing to adverse criticism.

At the meeting of the Brighton Council on December 18, the Tramways Committee recommended that no action should be taken in the matter. Councillor Yates, however, proposed that free passes be granted to the members of the Council on the understanding that such passes would only be used when the members were travelling on Corporation business. On two previous occasions the exception to this resolution had been carried by the Mayor's casting vote. In the course of the discussion, the opinion was expressed that if the resolution was passed it would open the door to other local bodies and officials to apply for concessions. Councillor Yates mentioned that the members of the Track Sub-committee had a pass for doing special work in connection with the department. There were seventeen towns which gave some special facilities to Council members, although there were only two in which every member of the Council had a special pass. The motion was defeated by 27 votes to 14.

**Reduced Assessment of London Tramways.**—Report has been made to the London County Council by the Local Government, Records, and Museums Committee that in connection with the falling off in the tramway receipts owing to motor omnibus competition action taken had resulted in reductions being obtained in assessment of the tramways in nearly all the metropolitan boroughs affected. In the case of Islington an application had to be made to the High Court for the purpose of getting a valuation list made, and the Divisional Court on December 2 made a rule absolute, the order being for a writ of mandamus to the Assessment Committee to appoint a person to make a list. Notice of appeal had been given, and the Committee obtained authority to take the necessary steps for protecting the Council's interests. In regard to the borough of Bethnal Green, it was proposed that an appeal should be lodged at quarter sessions against the supplemental valuation list. The borough of Hammersmith had refused to appoint a person to make a provisional valuation list, and it was agreed that the same action should be taken as in the case of the borough of Islington.

# MISCELLANEOUS NEWS AND NOTES.

**The Skefko Ball Bearing Company, Limited,** of Luton, have removed their London office to 28, Victoria Street, Westminster, S.W.

**The Leeds Strike.**—While the tramwaymen, with the exception of power station hands, have returned to work, the men of other departments are holding out for complete reinstatement.

**Our Present Issue.**—On account of Christmas Day occurring on Thursday, this issue is published on December 24. Consequently the majority of the Traffic Returns are those from the issue dated December 20.

**Unusual Occurrence.**—It is stated that owing to the sudden application of the emergency brake of a car at Snow Hill, Handsworth, on December 13, a rod was forced through the floor of a vehicle, causing injuries to the legs of two passengers.

**Season Ticket Question.**—By 21 votes to three Perth Council have instructed the Tramways Committee to prepare a report on the subject of season tickets. The committee, by seven votes to six, had rejected a motion in favour of such tickets.

**Christmas Day at Hull.**—As after five o'clock on Christmas Day the traffic is of very small volume, Mr. W. J. McCombe, the tramways manager, has announced that the committee have decided that the tramways traffic shall cease at five p.m.

**Improved Conditions for London United Tramwaymen.**—The London United Tramways Company announce an increase of pay, from 4s. 6d. to 5s. per day, to their conductors, after January 1. In addition the men will obtain improved conditions affecting the rest day.

**Wind Screens at Darwen.**—The Tramways Committee of the Darwen Corporation tramways have sanctioned the use of the wind screen, designed by the general manager, Mr. F. J. S. Hosken, on ten open cars. The top portion of the screen provides space for advertisements.

**Scottish Light Railway Scheme.**—The Association for the Development of the Counties of Aberdeen, Kincardine, and Banff have made an application to the Development Commissioners for a grant towards the cost of constructing a light railway from Alford to Strathdon at a cost of £94,000 for wide gauge or £68,900 for narrow gauge.

**A Summons for Carrying a Drunken Passenger.**—A tramcar conductor was summoned by the Metropolitan Police at Tottenham for failing to put a drunken man off his car. Defendant, who was fined 20s., denied that the man to his knowledge was drunk and said the vibration of the cars often upset people and made them appear unsteady.

**Numerals for Bristol Services.**—In consequence of the increase in the tramcar and omnibus services the Tramways Company have decided to number the vehicles according to routes. The tramcars, in addition to having the indicator at each end naming the termini, will be furnished with a service number, up to 17. Similarly the motor omnibuses will bear figures from 18 to 32.

**A Huddersfield Extension.**—The Corporation have completed the tramway extension from Birchencliffe to Elland. A mile has been laid with double track and half a mile with single track. The rails were welded by Thermit, Limited. Rails have been stacked along the route to West Vale, to which place an extension is to be made as soon as road widenings have been completed.

**Open Cars for Southend.**—The light railways engineer has been directed to obtain tenders for the supply of three single-deck open cars, which could be covered in during inclement weather, for use in connection with the extensions to Bourne Green and Thorpe Hall Avenue. The Light Railways Committee believe that the cars will gain much extra traffic in the summer time.

**Impending Purchase of Omnibuses for Edinburgh.**—In order to definitely decide upon the routes to be worked, and to further consider the type of motor omnibus to be acquired by the City Council, the Tramways Committee on December 10 took a ride in one of the single-decked petrol omnibuses plying between the city and Uphall. The question will be further discussed at the January meeting, when tenders for six vehicles will be opened.

**Track Maintenance at Ashton.**—The Tramways Committee have agreed to contribute to the Highways Committee £550 per annum to cover cost of maintenance of the tramways, to pay the actual cost for materials and labour necessary in case of renewals, and to provide all rails, points or any other steelwork required. No renewals are to be executed without first being reported to the tramways department.

**A London Car Shed Extension.**—In regard to an estimate of £18,900 already approved for the erection of the extension of Abbey Wood car shed, the Highways Committee have reported to the London County Council that it would be necessary to execute certain paving, track, overhead, and lighting works at an estimated cost of £1,670. A traverser and hydraulic pit jacks must also be provided at an estimated cost of £650 and £210 respectively. The works should be carried out by the staff of the tramway department. The recommendation was agreed to.

**Separate Tracks for Birmingham and Southend Extensions.**—The impending extension of the Birmingham tramways to Northfield is to be constructed on a separate track, and the rails will be laid on sleepers. By adopting this course the chairman of the Tramways Committee estimates a saving of about £3,000 per mile of road for paving, besides effecting economy in maintenance.—To connect the new residential seaside district of Thorpe Bay with Southend the Corporation have constructed a new road 100ft. wide. Half of it is used as a carriage drive, and on the other half an extension of the tramway system is being constructed on sleepers. The tramway will be enclosed on each side by a shrubbery.

**The Future of Road Traction.**—The Mayor of Durban, South Africa, in referring with satisfaction to the deferred decision of the Council in regard to a proposed important tramway extension, said that recent developments in regard to road traction appeared to him to indicate that the days of the tramway were numbered and that motor and electric 'buses would ere long supplant the tramcar equipment.

**Value of Tramway Standards.**—Whilst motorists are urging for the removal of the centre standards in the Glasgow tramway system, others are declaring that there is no evidence whatever of any desire on the part of the ratepayers in Hillhead and Kelvinside for the removal of these splendid elements of safety for the pedestrian. The poles, it is contended, serve a most useful purpose in splitting the traffic, and if the scorching motorist is compelled to slow down to a reasonable speed the public are all the better pleased.

**Light Railways Order.**—The Board of Trade have recently confirmed the under-mentioned Order made by the Light Railway Commissioners:—West Hartlepool Light Railways (Amendment) Order, 1913, authorising the Corporation of West Hartlepool to borrow money for the purpose of purchasing the light railways authorised by the West Hartlepool Light Railways Order, 1897, and by the West Hartlepool Light Railways (Deviation, etc.), Order, 1901, and for other purposes.

**Screens for Motormen.**—For some years the Manchester tramcars which travel beyond the city boundary have been fitted with glass screens. Cars confined to the city are not so fitted up, as in heavy rainstorms the wet glass impedes the drivers' view of the traffic. Birkenhead tramways department are experimenting with a screen made in three sections, the top and bottom pieces being of celluloid and the middle part of glass. When not in use the screen can be packed away in a small box.

**Revised Fares at Salford.**—Following a revision of the tramway fares instituted in November on four routes, at an estimated cost of £5,000 per annum, the Council expressed the opinion that other routes should also be considered. Mr. G. W. Holford, the general manager, has prepared an extended scheme, which will be presented at the next meeting of the Council. If the Council decide to carry out the whole of the proposals it is estimated that the reductions will cost some £11,000. It is hoped, however, that the longer stages will recoup the Corporation by the greater use made of the cars.

**Alleged Overcrowding at Stoke.**—Councillor G. Hassall informed the Stoke-on-Trent Council on December 18 that on the route from Hanley to Goldenhill he had known times when 75 persons had been crowded on tramcars which were only built to accommodate 28. He had also seen 14 on the back platform. The Town Clerk informed the Council that the manager of the company attended a meeting of the Estates Committee, and submitted a census of the traffic on the Goldenhill to Hanley route, between November 9-18, showing particularly the cars which had been overcrowded. The committee informed the manager that they were not in a position to question the figures, but that it was obvious to the Council that there was continual overcrowding, and that in the opinion of the committee this overcrowding could to a certain extent be remedied. The Council decided to give the company notice that unless there was an improvement in a month the Council would institute a prosecution.

**Repair of Solid Tyres.**—In view of the great and continued advance of the commercial motor vehicle the announcement by the Continental Tyre Company, 3 and 4, Thurloe Place, South Kensington, S.W.—makers of the famous "T" pattern solid band tyre—that they can carry out repairs to solid tyres owing to extensions to their repairing plants will be heartily welcomed. The importance of this development, which is the result of investigation and careful experiment, cannot be overrated. Solid tyres frequently suffer serious injury in the course of work, and owners have had to bear the heavy expense of early replacement, whereas now, at a comparatively trifling cost, they can have their injured tyres restored to their normal condition, and made as fit for further use as when they were new. This is, of course, provided the damage to the tyre is not so vital as to render repair hopelessly impracticable. Particulars and estimates for repairs will be gladly supplied by the Continental Tyre Company.

**Inspection of New Plant at Newport.**—Under the guidance of Councillor J. Moxon, chairman of the Electricity and Tramways Committee, and Mr. A. Nichols Moore, borough electrical and permanent way engineer, a large company on December 17 inspected the new turbo-alternator and other plant at the generating station. Councillor Moxon mentioned that until three o'clock that afternoon there had been no opportunity of experimenting. Thus the satisfactory way in which the new machinery had worked was most gratifying. Without any disparagement to the makers, who had done their best to give satisfaction, the chief credit was due to the fact that they had had the best brains and the almost inexhaustible physical energy of the staff devoted to the work. No words could express the gratitude he felt to Mr. Moore and to Mr. Thain. It had not been an 8 hours or even a 16 hours' day, but for the last few days a 24 hours' day, and the work reflected great credit upon them. He was sure they were more than repaid for the trouble they had taken in the knowledge that it was all appreciated. He believed the undertaking would now go on and prosper.

**Tramway Traffic Pressure at Glasgow.**—Considerable advantage in dealing with the pressure of traffic during the holidays will be derived from the temporary abolition of the rule which forbids passengers standing in covered double-deck cars, and by permitting

Digitized by Google

six persons to stand at the driver's end of the lower saloon. The gauge at Glasgow is 4ft. 7¾in., and Mr. Dalrymple states that the Act of Parliament prevents the department making the cars any wider than they are now. Some years ago the Tramways Committee endeavoured to get authority to widen the cars a couple of inches, but there were protests against cars taking up more room on the streets. The Corporation have instructed the department to proceed with the erection of 150 additional cars, which will bring the total up to 1,000 cars. In the old days Glasgow prided itself on carrying on an average 11 passengers per mile; the third week in December showed an average of 15. No city in the Kingdom, it is said, equal those figures. On the longest route —Paisley to Uddington and Baillieston—695,000 persons were carried in the above week, 407,000 being halfpenny fares. Over the whole system fully 64 per cent. were halfpenny fares. Passengers travelling the penny distance were almost 27 per cent., which left only 9 per cent. of the whole over a penny. The average for each passenger is about ¾d.

**Damages Against London Tramway Authorities.**—In the King's Bench Division a music hall performer named Burdett was awarded £125 damages against the London County Council for personal injuries said to have been received through his foot catching against a stud in the platform of a car at Shoreditch. It was alleged that the stud, which worked the sanding apparatus, projected two inches above the level of the boards. For the defence it was stated that plaintiff might have slipped from the platform, but that was not due to negligence on the part of the driver.—At Bow County Court a boiler maker named John McDowell obtained judgment for £100 for injuries sustained through being knocked down by a Leyton Council tramcar while he was in a crowd boarding a car belonging to West Ham Council at Albert Docks. Evidence was given that it was impossible for inspectors or policemen to control the crowds and get them to board the cars in an orderly manner. It was urged for the defendants that they were not responsible because the lines belonged to the West Ham Corporation, and the defendants only had running powers over them.—Damages amounting to £128 and costs were recently awarded at Westminster County Court to two Battersea horse-dealers, named Patrick Flynn and Edward Harne, against the London County Council for injuries sustained and the value of a horse, following an accident in High Street, Woolwich, due to the defective condition of the tramlines. The evidence showed that at the point where the accident occurred the lines were an inch and a half above the level of the surrounding roadway.

## PERSONAL.

**Alderman Finnigan,** at the request of the chairman and members of Belfast Tramways Committee, has withdrawn his resignation of the vice-chairmanship.

**Mr. C. Macarthy,** a conductor employed by the Swansea Tramways Company, is said to have received a communication from a firm of South African solicitors to the effect that he is entitled to a considerable sum of money.

**Mr. R. W. Bruce,** of London, has been appointed general superintendent and chief engineer of the Canada Electric Co., Amherst, N.S. He will also have charge of the electrical equipment of the Maritime Coal, Railway and Power Company at Joggins Mines.

**Mr. H. G. Sabine,** formerly chief ticket inspector to the Isle of Thanet Tramways Company, who now holds an appointment in the Government Tramways of Western Australia, has sent his old colleagues at Ramsgate Christmas greetings in verse. In his new sphere he is known as the "tramway poet."

**Mrs. Schofield,** wife of Mr. F. Schofield, tramways manager at Leyton, presented the prizes awarded at a fancy dress ball arranged by the Leyton Tramways Social and Athletic Club. This was the first event of the kind arranged by the club, and the judging was entrusted to the chairman of the Council, Councillor Heather, chairman of the Tramways Committee, and the manager, and other gentlemen.

**The Rev. F. A. W. Wilkinson,** on leaving West Ham to become Vicar of Chertsey, Surrey, has been presented by the members of the West Ham branch of the Tramwaymen's Brotherhood with gifts for himself and Mrs. Wilkinson. The attendance included the Rev. Dr. Darlington, founder of the Brotherhood, and Mr. J. S. D. Moffet, general manager, West Ham Corporation tramways.

**Mr. Peter Fisher,** general manager, Dundee Corporation tramways, and Mr. Robertson, Greenock borough electrical engineer, are advising Stirling Corporation on the questions whether that body shall construct electric tramways or dispose of their electricity undertaking for £32,000 to Messrs. Balfour, Beattie, and Co., who have offered to install electric tramways, and to give reductions in charges for private and public lighting. The electrical engineer and the borough surveyor have prepared a report in which they estimated the cost of constructing tramways at £78,000.

**Mr. S. E. Smith,** one of the directors of the Bristol Tramways and Carriage Company, presided on December 20 at the first annual staff dinner of the motor constructional works of the company, which have now been open for a year. In responding to the toast of the motor constructional works, the chairman said they had a very well-filled staff, the only link missing being that of works manager, but they hoped to fill that vacancy very soon. They had works that were as well equipped as any in the country. Labour and capital each had their responsibilities; they were not antagonistic, as they were constantly hearing nowadays. They must both try to carry out their responsibilities; the directors were doing their part, and he was sure the employees were also doing their best. They were not to think that anyone would be victimised for complaining, and every complaint would be carefully considered. That was a necessary feeling to exist if they were to ensure success.

**Expert Aid Suggested for Directors.**—Mr. Fleming, a shareholder, speaking at the Burmah Tramways Company meeting, said he did not suggest that the company was not well managed, but he suggested that the directors should allow the stockholders to have on the board a modern tramway operating man. In reply, the chairman observed that the fees of the directors amounted to the large sum of £100, and an expert was not going to devote his time to the company for £100 per annum. But the suggestion should be considered, and if they saw any prospect of getting such assistance they would be only too delighted.

**Mr. H. W. Laing,** general manager and electrical engineer to Blackpool, St. Anne's, and Lytham Tramways Company, was referred to at the annual meeting by the chairman, Mr. Geo. Nicholson, who stated that the traffic expenses, costs and the cost of current per car mile continued to be the lowest in the country. They owed this result to the constant care and vigilance of their manager, Mr. Laing, who was deserving of their thanks. Referring to a complaint made by Mr. Boyd, a shareholder, as to the charge for current by Blackpool Corporation, the chairman said such remarks would prejudice the directors in their negotiations with the Council.

**Alderman D. L. Winter,** chairman of the Rotherham Tramways Committee, has published a letter in the local papers explaining the reasons why he intends asking the Board of Trade to hold an inquiry into the decision to double the Fitzwilliam Road tramways and to construct a line through Nottingham Street. He has had statements prepared which show that with the five minutes' service now run in Fitzwilliam Street the delays to would-be passengers are a negligible quantity. Alderman Winter refers to Nottingham Street as being too narrow for tramways, and condemns the project as being unnecessary. The tramways manager and the borough engineer are opposed to the schemes.

**The Late Mr. T. Blane.**—Reference was made by Mr. G. Nicholson, the chairman, at the annual meeting of the Blackpool, St. Anne's, and Lytham Tramways Company, to the death of Mr. Thos. Blane, formerly chairman of the company, which occurred shortly after the last annual meeting. The board, Mr. Nicholson said, had lost a valued colleague, whose wide experience and sound judgment were always readily placed at the call of his colleagues. To fill the vacancy Mr. Thos. Preston, of St. Anne's, had been elected a director.

## FINANCIAL REPORTS AND MEETINGS.

**Melbourne Tramway and Omnibus Company.**—A quarterly dividend of 6d. per share and a bonus of 6d. per share are announced, payable on January 2.

**Winnipeg Electric Railway Company.**—A dividend at the rate of 3 per cent. for the quarter ending December 31 has been declared on the fully paid-up capital stock.

**Yorkshire (West Riding) Electric Tramways Company.**—The directors announce a dividend at the rate of 5 per cent. per annum on the 6 per cent. preference shares, making 4 per cent. for the current year.

**Proposed Purchase of Brisbane Tramways.**—The Premier of Queensland has given notice in the Assembly of the introduction of a Bill dealing with the acquisition of the Brisbane tramways by the local authorities at the expiration of the company's time. He said the Bill need not go beyond the first reading this session.

**Traction and Power Securities, Limited.**—At the Law Courts, on December 9, Mr. Justice Joyce heard a petition by the Traction and Power Securities, Limited, for sanction to a reduction in capital. Mr. Hughes, K.C., for the company, said they had more money than they wanted. This surplus amounted to £174.000, and what was proposed was to apply that in paying £2 a share back to the shareholders. His Lordship sanctioned the reduction.

**Manx Electric Railway.**—The gross receipts for the year to September 30 amount to £40.160, and the gross expenditure to £18.740. Including £920 brought forward, there remains a total of £22,340. After deducting debenture interest amounting to £9.000, and the amount of the interim dividend of 2¾ per cent. on the preference shares, there remains £9,759. It is proposed to allocate to reserve for special renewals £2.000, and to pay a dividend of 2 per cent. on the ordinary shares, leaving £2,179 to be carried forward.

**Isle of Thanet Tramways Company.**—Mr. A. R. Monks, presiding at the annual meeting of the Isle of Thanet Electric Tramways and Lighting Company, in London, on December 8, said that the profit for the past year was £21,635, against £10.769 in the previous year. They were paying 3 per cent. on the preference shares, placing £2,000 to rolling stock reserves, and £6,000 to future maintenance of permanent way. In order to meet motor char-a-banc competition, they had hired two single-deck motor-omnibuses and secured a profit of over £300.

**Douglas Southern Electric Tramways.**—The report states that the traffic receipts for the season were £6.492, against £5.204. The passengers carried were 265,763, against 212,528. The net profit is £2.435, against £1,733. The directors recommend the full dividend on the 7 per cent. non-cumulative preference and a dividend of 3¼ per cent. on the ordinary shares, absorbing £2,321, carrying

Digitized by Google

forward £291. Mr. T. J. Hutchinson, who presided at the annual meeting, said the year had been a profitable one. The dividend on the ordinary shares was also higher than had ever been paid previously.

**Buenos Aires Port Tramways Company.**—Mr. George Kitchin, presiding at the annual general meeting of the Buenos Aires Port and City Tramways on December 15, stated that so far the returns for the current year, though showing an improvement on the latter part of 1912, could not be said to be satisfactory. It would not appear that the expenses had been reduced below an average of about 90 per cent. for the first eight months of the year. Two of their directors, Dr. M. Lacroze and Mr. John B. White, were leaving for Buenos Aires on January 9 to examine the condition of the property and the best means of working it and to consult with the local committee. When they met to consider the accounts for 1913—which, he hoped, they might do in June of next year—he anticipated being able to put a more satisfactory statement before them. That in the course of the year £17,507 should have been spent on cars and car-bodies seemed almost incredible. This expense had been incurred notwithstanding that for the two preceding years, when called upon to face an additional expenditure in respect of cars and car-bodies, they had been each time informed that such expenditure was exceptional, and already practically finished. Notwithstanding that, Messrs. J. and G. White, in the report they had prepared for the board, stated that they "figure out that a complete revision of the cars and fitting up in a normal state would cost about £4,000." A cable message received that morning showed an increase of traffic up to the end of November of £7,340. The working expenses for the last three months averaged 84.50 per cent.

**Burma Electric Tramways and Lighting Company.**—Mr. D. C. Ellis presided at the annual meeting of the Burma Electric Tramways and Lighting Company. He said that the past year's results were the best attained since the formation of the company, the earnings amounting to £7,575, against £3,748 in the previous year. This improved result was attributable to the increase in receipts from both traffic and light and power supply, and the saving in power and generating expenses due to the use of the Diesel engine in the place of the steam set. There had been placed to reserve for depreciation the sum of £5,000, against which account would be debited the cost of the second Diesel set, which was now on order. The balance of £2,575 added to the sum of £1,333 brought forward gives an available amount of £3,908, out of which it was proposed to pay a dividend of 3 per cent. on the preference shares, leaving £908 to be carried forward. In view of the opposition to the scheme of the board for dealing with the eight years' preference divided arrears, they had decided to postpone the matter in order that the earning capacity of the system might be more definitely ascertained. The manager and chief engineer, Mr. A. H. Burbidge, in commenting on the year's working, had pointed out that the improved result was to a great extent due to what he considered exceptional conditions, and warned the board not to anticipate a corresponding increase in the future. This warning was obviously given to prevent an exaggerated and unsafe estimate of the earning capacity of the undertaking being made. The report was adopted.

**Blackpool Tramways Company's Chars-a-Banc Services.**—It was stated by Mr. G. Nicholson, who presided at the annual meeting of the Blackpool, St. Anne's and Lytham Tramways Company on December 15, that the directors intend to extend the motor chars-a-banc service as far as they possibly could, and additional powers would have to be obtained. The motor chars-a-banc they had purchased cost £850, and the results of long-distance trips to Southport, the Lakes, etc., were very satisfactory. The St. Anne's Council from the end of May reduced the cost of current to 1½d. per unit, a reduction of a farthing, and they had also granted concessions on the rent of the feeder cable and on the charge for arc lamps. The reduction altogether would amount to over £400 per annum. Owing to the fine weather the traffic receipts were £2,800 more than in the next best year. The cheap evening return tickets from Lytham and St. Anne's had been made good use of, and would be more popular still if the cars had covered tops, but owing to the company's financial condition they could not undertake this expenditure. The traffic expenses, costs, and the cost of current per car mile continued to be the lowest in the country. They had spent £4,800 on repairs to the track, as against £3,272 in 1912. The expenditure in this direction next year would again be above normal, but they hoped that after the next two years this extraordinary expenditure would cease. Mr. Boyd strongly complained of the conditions imposed by Blackpool Corporation, and another shareholder asked if it would not be well to wind up the concern altogether, to which the chairman replied that if they did they would get nothing at all. The meeting adopted the directors' report, in which it was stated that the trustees for the debenture holders had, upon the recommendation of the directors, intimated their intention of paying 2½ per cent. interest on account of arrears of interest due on the debenture stock. The net balance of revenue for the year was £5,056, and after the payment of £7,500 for debenture interest and £1,500 to the sinking fund, the balance carried down shows a debit of £34,103.

## NEW AND PROSPECTIVE WORK.

BOURNEMOUTH.—The Beach Committee have been directed to consider the question of a miniature tramway for the Undercliff Drive between Bournemouth and Boscombe Piers. Some time ago the Council disapproved of a scheme to extend the tramways, and permission to use the Drive has also been refused to the owners of motor char-a-bancs. A proposal placed before the Beach Committee provides for the use of railless electric cars weighing about 2½ tons and holding about 15 persons.

BURY.—The Tramways Committee have asked the Board of Trade to consent to the laying of a track in connection with the Limefield extension of tramways at the same time as the granite paving would be laid down.

HUDDERSFIELD.—A report is to be prepared on the advisability of doubling the track on the Outlane, Longwood, and Sheepbridge sections.

SOUTH SHIELDS.—The Tramways and Parks Committees are considering a scheme submitted by Mr. W. T. Robson, the tramways manager, for a light railway extension of the tramways along Sea Road, at an estimated cost of £4,940, in order to open up the beach at holiday time by the erection of a floral pavilion for an orchestra and other forms of entertainment.

## COPPER AND ALUMINIUM MARKET.

December 23, 1913.

Messrs. Henry R. Merton and Co., Ltd., 2, Metal Exchange Buildings, Leadenhall Avenue, E.C., supply the following quotations of prices per ton :—

THE
**Challiner**
WORLD & GIANT
**Tyres**

The value of a tyre is equal to the mileage it will yield.

The science of construction which governs its value is in the Challiner's Patent World & Giant Tyres the outcome of over 30 years' experience.

No other combination of improvements has done more within recent years to reduce the running cost of commercial motor vehicles. Every extra mile that these tyres run more than the next best represents **Free Tyre Service.**

An official Government Journal reporting on tyres for tropical climates states:
"Continual trouble was experienced with all tyres used until the Shrewsbury & Challiner Band tyre were obtained."

**The Shrewsbury & Challiner Tyre Co., Ltd., Ardwick, Manchester.**

Page St., Westminster, London. Valmar Rd., Camberwell, London.

*Founded* 1892.

*The Tramway & Railway World.*

**Motor Traffic Section.**

When "The Tramway and Railway World" was founded in 1892, motor traction was, of course, scarcely dreamt of, but the avowed object of the paper was to encourage all new methods that gave promise of usefulness.

In pursuance of that policy the progress of motor traction received early attention. Commenting on the historic motor parade to Brighton in 1896, "The Tramway and Railway World" foretold that

"It would give a prodigious impulse to transport both by road and rail."

Within a decade this prophecy was abundantly fulfilled and so much space had been devoted to the new industry that in 1906 a special

**MOTOR TRAFFIC SECTION**

**Public Service Motor Cars.**

was added. Every illustrated issue thus contains a section devoted entirely to motor cars for Public Service, and includes special articles on current topics, illustrated descriptions of new types of vehicles and accessories, reports by the leading authorities, and the latest information with regard to the development of the industrial motor both at home and abroad.

The importance of this section will be gathered from the fact that a large number of the leading municipal authorities, railway and transport companies, now own and operate large fleets of motor vehicles of various types, including omnibuses, char-a-bancs, motor lorries for the transport of goods, parcel delivery vans, tower wagons, motor street sweepers, etc.

**LONDON GENERAL OMNIBUS COMPANY'S SYSTEM.**

An illustrated account of the Construction Works of the Company, where the well-known "B" type chassis was designed and is now manufactured.

A plan of the works and numerous views are given.

Price - SIXPENCE.

**READING CASES,**

to hold 26 copies of the Saturday Issues, 2s. 6d. each.

**of Municipal Tramway Accounts**
**will be found in the records published in the Illustrated Issues of**

## THE TRAMWAY AND RAILWAY WORLD.

**The capital and working reports are clearly and systematically arranged so that any required fact can be readily ascertained, while comparisons of results of the different systems can be easily made.**

The Tramways are divided into two classes :—

1. With generating stations providing current for both lighting and traction purposes.
2. With separate generating stations for traction.

Particulars are given under the following heads :—

**Capital Account :—**
Borrowing Powers.
Borrowing Powers Exercised.
Unexhausted Borrowing Powers.
Capital Expenditure per mile of Single Track.
Loans Outstanding.
Sinking Fund and Loans Repaid.
Depreciation, Renewal and Reserve Funds.

**Gross Profit on Working.**

**Working Expenses**
Traffic.
General.
Repairs and Maintenance.
Power.
Total.

**Gross Receipts :—**
Traffic.
Other Revenue.
Total.

**Deductions from Gross Profit :—**
Interest.
Sinking Fund.
Income Tax.
Depreciation and Renewals.
Sundries.
Total.

**Net Surplus or Deficit.**

**Appropriation of Net Surplus :—**
Carried Forward.
Reserve.
Relief of Rates.

**Percentage of Operating Expenses To Total Revenue.**

**Receipts per Car Mile :—**
Average Total per Car Mile.
Average Traffic Total per Car Mile.

**Operating Expenses per Car Mile :—**
Traffic.
General.
Repairs and Maintenance.
Power.
Total.

**Average Operating Expenses per Car Mile (excluding Power Cost).**

**Board of Trade Units —**
No. of Units used.
Cost per Unit.
Units used per Car Mile.

**Traffic Records :—**
Population served.
Car Mileage.
Passengers Carried.
Passengers carried per Car Mile.
Average Fare per passenger.
Average Journeys per head of population served per annum.
Average Car Miles per Day per Car.
Traffic Revenue per Mile of Single Track.
Average Traffic Revenue per annum per head of population served
Operating expenses per passenger.
Average distance of 1d. fare.
Average fare charged per mile.
Average speed per hour.
Average Car hours per day.
Average number of Cars in use daily.
Number of cars in stock.
